Commission Decision

of 13 July 2005

**declaring a concentration compatible with the common market and the
EEA Agreement**

(Case No COMP/M.3653 - Siemens/VA Tech)

(Only the German text is authentic)

(Text with EEA relevance)

THE COMMISSION OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Community,

Having regard to the Agreement on the European Economic Area, and in particular Article 57 thereof,

Having regard to Council Regulation (EC) No 139/2004 of 20 January 2004 on the control of concentrations between undertakings,¹ and in particular Article 8(2) thereof,

Having regard to the Commission decision of 14 February 2005 to initiate proceedings in this case,

Having regard to the opinion of the Advisory Committee on Concentrations,²

Whereas:

¹ OJ L 24, 29.1.2004, p. 1.

² OJ C [...], [...] 2003, p. [...].

- (1) On 10 January 2005 the Commission received notification of a proposed concentration pursuant to Article 4 of Council Regulation (EC) No 139/2004 ("the Merger Regulation").³ According to the notification, the following is proposed: the company Siemens Österreich AG ("Siemens Österreich", Austria), which is controlled by Siemens AG ("Siemens", Germany), is to gain control, within the meaning of Article 3(1)(b) of the Merger Regulation, of the company VA Tech AG ("VA Tech", Austria) by a public takeover bid made on 10 December 2004.
- (2) The Commission concluded that the notified concentration fell within the scope of the Merger Regulation and took the preliminary view that it raised serious doubts as to its compatibility with the common market and the European Economic Area. It therefore adopted on 14 February 2005 a decision pursuant to Article 6(1)(c) of the Merger Regulation initiating Phase II proceedings for examination of the notified proposal.
- (3) On 22 April 2005 the Commission sent a statement of objections to the notifying parties in which it found that, as a preliminary assessment and on the basis of the information so far available to the Commission, the notified proposal was incompatible with the common market
- (4) Siemens replied to the statement of objections in a written statement submitted on 6 May 2005. In a written statement submitted on 25 May 2005, Siemens offered commitments designed to remove any existing competition concerns.
- (5) The Commission has now come to the conclusion that, in its notified form, the proposal is liable to significantly impede effective competition in a substantial part of the common market, in particular as a result of the creation of a dominant position. However, the commitments given by the parties allow the competition concerns regarding the concentration to be dispelled. This Decision is issued pursuant to Article 8(2) of the Merger Regulation.

I. THE PARTIES

- (6) Siemens supplies products and services worldwide in various areas of industry and electrical engineering. Its areas of activity include plants for power generation, transmission and distribution, automation and traction technology, plant engineering and construction, technical services, traffic engineering, building services engineering and information technology.
- (7) In the area of equipping hydroelectric power stations, Siemens is working on a joint venture ("JV") with the company J.M. Voith AG (Heidenheim, Germany), in which Siemens holds 35% of the shares and has joint control. [...] * The Commission's competition assessment rests on the same basis, but it would not change fundamentally if, hypothetically, the concentration were only to lead to Siemens acquiring a majority holding in VA Tech and continuing the JV separately with

³ OJ L 24, 29.1.2004, p. 1.

* Parts of this text have been edited to ensure that confidential information is not disclosed; those parts are enclosed in square brackets and marked with an asterisk.

Voith. Only the extent, but not the existence, of the effects to be expected from the concentration might possibly change as a result.

- (8) Through various subsidiaries, VA Tech is active in the areas of power generation (hydroelectric power stations and fossil fuel power stations), power transmission and distribution, metallurgy engineering, infrastructure (in particular building infrastructure), rail traffic technology and electrical plant engineering.

II. THE PROPOSAL

- (9) The object of the notification is the proposal by Siemens, through a public bid by its subsidiary Siemens Österreich, to increase an existing holding in VA Tech from 16.45% of the voting rights to at least 50% plus one share and so to acquire sole control. [...] ⁴

III. CONCENTRATION

- (10) The proposal is a concentration within the meaning of Article 3(1)(b) of the Merger Regulation.

IV. COMMUNITY DIMENSION

- (11) The companies involved achieve a combined aggregate worldwide turnover of more than EUR 5 billion.⁵ (Siemens: EUR 74 billion in the financial year from 1 October 2002 to 30 September 2003; VA Tech: EUR 3.9 billion in the financial year 2003). Siemens and VA Tech each have an aggregate Community-wide turnover of more than EUR 250 million [...]. Neither of the companies achieved more than two thirds of its aggregate Community-wide turnover within one and the same Member State. The notified concentration therefore has a Community dimension within the meaning of Article 1(2) of the Merger Regulation. The proposal constitutes a case of cooperation with the EFTA Surveillance Authority under Article 57 of the EEA Agreement.

V. COMPETITION ASSESSMENT

- (12) The proposed concentration leads to numerous horizontal overlaps and vertical links, in particular in the following areas: A. Power generation (equipping hydroelectric power stations and gas-and-steam power stations); B. Power transmission and distribution; C. Rail; D. Frequency Inverters; E. Metallurgy and Other Industrial Plant Building; F. Low Voltage Switchgear; G. Building technology; and H. Infrastructure Facilities and Cable Ropeway Electrics, I. Other IT-Services

⁴ [...]

⁵ The turnover calculation is made on the basis of Article 5(1) of the Merger Regulation and the Commission notice on calculation of turnover (OJ C 66, 2 March 1998, p. 25).

A. POWER GENERATION

AI. EQUIPMENT FOR HYDROELECTRIC POWER STATIONS

1. Relevant product market

- (13) Siemens says that the equipping of hydroelectric power stations is a product market in its own right and that further segmentation, e.g. into electrical and mechanical engineering, is not necessary. The product market proposed by Siemens accordingly comprises all the mechanical and electrical components of a power station, such as water turbines, generators, instrumentation and controls, hydraulic control systems, pump turbines, valves, etc. The construction work (e.g. the dam), on the other hand, would belong to a separate product market, in which neither Siemens nor VA Tech is active.
- (14) According to Siemens, the fact that, on the supplier side, most competitors can offer both mechanical and electrical engineering, as well as a trend also evident in Europe towards joint tenders for both groups of components, indicate such a broad product market definition. In this connection, the notifying party refers to several concentrations between manufacturers of mechanical equipment and electrical manufacturers in recent years, including Alstom/ABB, GE Hydro/Kvaerner and VA Tech/Sulzer as well as the joint venture between Siemens and the mechanical manufacturer J.M. Voith AG. To this extent, in Siemens' opinion, the market conditions since the Commission Decision in Voith/Siemens/JV (M.1793) have changed.
- (15) The Commission's market investigation confirmed that the main suppliers of hydroelectric power stations in the EEA, including Voith Siemens, VA Tech, Alstom, and GE Hydro, can supply both mechanical and electrical components, even if market presence and reputation with customers are not the same for both areas in each case. The companies' product range includes in particular water turbines and hydrogenerators as well as other mechanical and electrical components, the "mechanical balance of plant" ("MboP") and the "electrical balance of plant" ("EboP"). It is not possible to confirm whether the Asian suppliers (from China, India and Japan) are also active in the various areas because, at present, they are not perceived as credible suppliers in the EEA by the customers questioned in the market investigation. Nor have they so far taken part in any tenders in the EEA (see Part VI).
- (16) The market investigation also shows that the scale of the product packages jointly sought in tenders for hydroelectric power stations varies enormously. There are both tenders for total equipment (mechanical and electrical) and tenders for individual components. The latter is particularly the case in modernisation projects, which account for a large share of demand in the EEA. Here tenders often relate to only

parts of the mechanical or electrical equipment.⁶ From the point of view of demand, the various hydroelectric power station components are not substitutable.⁷

- (17) On the other hand, the supply-side substitutability cited by the parties leads to the conclusion that the relevant product market covers the equipping of hydroelectric power stations (without any distinction as between mechanical and electrical equipment) since the main competitors listed by Siemens, in so far as they are active in the EEA, have confirmed that they are active in both mechanical engineering and in electrical engineering as well as in MBoP/EBoP.⁸
- (18) Furthermore, hydroelectric power stations vary considerably in size. For example, water turbines are supplied with an output ranging from less than one megawatt up to an output of approximately 700 MW. A number of smaller local suppliers are active mainly in the area of small hydroelectric power stations ("compact hydro" or "small hydro").⁹ Some of these companies only have an annual turnover of less than €10 million. The hydroelectric power station components in the compact hydro sector are much more standardised and, from the point of view of demand, cannot be substituted with larger components. However, hydroelectric power station equipment is offered in a continuum of output levels, without there being any obvious dividing line. For organisational purposes, VA Tech Hydro¹⁰ classes installations up to 15 MW as belonging to the compact hydro area of the business.¹¹ The reason given for this classification is, among other things, that some national tax incentive programmes are limited to installations under 15 MW. Furthermore, these are standardised and modularised products which can be used on the market for smaller installations.¹² Other market participants have suggested lower output levels for a delimitation of the small hydro segment. The German law on renewable energies (in contrast to other national programmes) currently limits the tax incentive to 5 MW installations.¹³
- (19) Together with the lack of a clearly definable dividing line for a possible distinction between size classes, the following additional characteristics of the hydroelectric power market in the EEA lead to the conclusion that subdivision into different product markets on this basis would not be appropriate. The dividing line is further blurred by the fact that in the EEA most tenders relate to the replacement, modernisation or refurbishment of power station components. Smaller competitors sometimes offer refurbishment work on larger installations, whereas larger suppliers also offer their services for very small tenders for projects of less than EUR 1 million.¹⁴ Given these supply-side factors, a subdivision of the market for the

⁶ See, for example, the comments of Norsk Hydro (a Norwegian customer) on possible tendering strategies (#1973).

⁷ For example, turbine versus generator, piping versus electrical components. The fact that these products cannot be substituted for each other but are at most complementary products, should not need any further explanation.

⁸ See competitors' replies to the Commission's market survey and customers' replies, described in further detail in Section 3.

⁹ Including Andino, Kössler, Wasserkraft Volk, Gugler, Gilkes and Andritz.

¹⁰ In VA Tech Hydro GmbH, VA Tech's hydroelectric and "combined cycle" activities are combined.

¹¹ 2003 Annual Report of VA Tech Hydro, p. 4.

¹² See VA Tech's reply to question 3 of the request for information "Questions to VA Tech, 17.3.2005".

¹³ See HydroWorld Alert, 1.12.2003, p. 7, submitted by Siemens in document #6661.

¹⁴ See Siemens' bidding lists.

equipping of hydroelectric power stations into different size classes is not necessary in this case.

- (20) As suggested by Siemens, the relevant product market therefore covers the equipping of hydroelectric power stations. As explained in paragraphs 16 to 19, the products in this market are characterised by considerable product differentiation.

2. Relevant geographic market

- (21) Siemens is of the opinion that the market in hydroelectric power station equipment is a worldwide market as all the main suppliers are active worldwide and "only rarely" do national preferences still exist. Even suppliers which had so far only been active regionally (including the Chinese suppliers Dongfang and Harbin, the Indian BHEL or Japanese firms) had in the meantime been making advances worldwide. For example, among other things, the Chinese supplier Sichuan Electricity had been awarded a project in Georgia. Furthermore, Siemens says in the notification (pp. 27/28) that price formation for hydroelectric power equipment takes place worldwide, that worldwide price competition is "enormous", that "regional price differences are hardly noticeable" and that there are no "major cost-related trade barriers". It also points out that its own hydroelectric power business (Voith Siemens) alone has production capacities outside the EEA, in China and Brazil. The market data submitted by Siemens indicate that some [5-10]*% of the worldwide turnover in hydroelectric power equipment comes from the EEA.
- (22) So far the Commission has examined the market in equipping hydroelectric power stations only for the purpose of clearance decisions pursuant to Article 6(1)(b) of the Merger Regulation. In case COMP/M.1793 - Voith/Siemens, the parties argued that the market was worldwide or at least EEA-wide, but that for maintenance work it was only EEA-wide. In that case, however, the relevant geographic markets did not need to be delineated further because in all alternative geographic markets examined effective competition would not have been significantly impeded in either the EEA or in a substantial part thereof.
- (23) The concentration in the case COMP/M.1484 - Alstom/ABB related to different types of power generation equipment, in particular for gas and gas-and-steam power stations. Hydroelectric power components played a subordinate role. The parties had argued in favour of a worldwide market, using the following arguments: "According to the parties the relevant geographic market for all affected product markets is the world for the following reasons: the major players in the power generation equipment industry (i.e. GE (US), Mitsubishi ("MHI") (Japan), Siemens (D)/Westinghouse (US) and ABB and ALSTOM), bid for all the major contracts in the world regardless of the location of the customer and do win bids in all of these areas. This worldwide tendering has resulted in worldwide price convergence for steam turbines and a substantial degree of worldwide price convergence for gas turbines."¹⁵ In this case too, the Commission ultimately left the geographic market definition open as there were no concerns about competition regardless of whether an EEA-wide or a worldwide market definition was applied. The hypothesis put forward by the parties in the Alstom/ABB case that in a world market all major

¹⁵ COMP/M.1484 - Alstom/ABB, paragraph 32.

competitors take part in tenders worldwide and also win them, as well as the question of price convergence will, however, also be examined below.

- (24) In the present case, the Commission's market investigation confirms that the leading suppliers in the market in hydroelectric power station equipment in the EEA (Voith Siemens, VA Tech, Alstom and GE Hydro) are active worldwide, even if they focus on certain main geographical areas. Siemens, Alstom and GE in particular have considerable production capacities outside the EEA. [...] ^{16 17}
- (25) The competitor analysis contained in the internal documents submitted by Voith Siemens also confirms the Commission's observation¹⁸ that the main geographical areas in which Siemens, VA Tech, Alstom and GE Hydro are active are supported by a local presence with service offices or even production plants. [...] ¹⁹ GE Hydro is similarly successful particularly in the regions (e.g. North America and Scandinavia) where it is represented by production plants and/or service offices. Alstom has production facilities in France and in China and Brazil.²⁰
- (26) Therefore, even if the main competitors listed by Siemens with a base in Europe are active to varying degrees on the world market, the EEA market differs from other parts of the world in that the Asian suppliers named by Siemens have so far not entered the EEA as credible bidders and so far have not won any projects here either. Similarly, the Asian competitors cited by the parties are not perceived as being potential suppliers by the customers questioned in the market investigation.²¹ The argument put forward by the parties that there are worldwide tendering procedures in the hydroelectric power market does not alter this. The fact that firms from other geographical areas which are less highly regarded by or unknown to customers could theoretically take part in tenders does not in itself alter the fact that a small but significant non-temporary price rise by a hypothetical monopoly-holder in the EEA would be profitable. In addition to this, the competitors would also have to be in a position to offer sufficiently close substitutes quickly, without significant sunk costs arising. Particular importance also attaches to being able to cite references from successfully completed projects, such references being necessary to allow firms to position themselves as credible suppliers. The absence from the EEA of the competitors listed by the parties as well as the clearly lower regard in which they are held by customers in the EEA²² indicates that there is not a uniform world market in hydroelectric power station equipment.
- (27) Accordingly, the observed market shares of European companies in Europe do not, as argued by the parties in response to the decision pursuant to Article 6(1)(c) of the Merger Regulation, result only from past history, but also from the customers' structure of preferences (see also Part VI) and from the ability of the suppliers to supply products tailored to the needs of the customer and, where necessary, to provide rapid support through customer service.

16 [...]*

17 [...]*

18 For example, on the basis of the bidding lists (see also section 3 below).

19 [...]*

20 According to notification (p. 28).

21 See evaluation of customers' responses to the Commission's market investigation in section 3 below.

22 Ditto.

- (28) In response to the Commission's enquiry as to any activities of new non-European competitors in the EEA,²³ Siemens was unable to provide any relevant evidence. In the analysis, a distinction must in any case be made between belonging to a *relevant market* and *potential competition* through market entry. In terms of content, the parties' arguments seem to be geared more to market entry but, even against this background, appear speculative as they are neither substantiated by the parties nor confirmed by the market investigation.
- (29) As for the argument put forward in the reply to the Commission's decision pursuant to Article 6(1)(c) of the Merger Regulation that, in the case of hydroelectric power station equipment, "worldwide homogeneous pricing or the presence of a correlation of price changes" was evident, Siemens put it down to demand. [...] ²⁴*
- (30) [...] ^{25 26 27}* If a single world market did in fact exist, it would be expected that Chinese suppliers would have endeavoured in 2001 and 2002 to win orders from European customers in order to take advantage of the - from their point of view - attractive price levels in the EEA. In fact, however, nothing points to any participation of Chinese companies in tenders for hydroelectric power station equipment in the EEA. The same applies to companies from other regions of the world (including other Asian countries), in so far as they are not already active in the EEA. Nor is the reference by the parties to two fairly large hydroelectric power projects by Dongfang in Albania in the 1960s and 1970s convincing in this respect.²⁸
- (31) [...] ^{29 30 31}*
- (32) Both from the examination of the current market structure and from the replies of competitors and customers to the Commission's market survey (outlined in section 3) [...] ^{*}, it therefore transpires that customers for hydroelectric power station equipment in the EEA see themselves faced with a different supplier structure than customers in other parts of the world and that potential market power in the EEA would in particular not be eliminated by the presence of suppliers in China, India or other parts of the world.³² The relevant geographic market does not therefore extend beyond the EEA.

3. Competition assessment

(a) Market shares

- (33) In the notification, Siemens estimated its own market share as well as those of VA Tech and the other competitors (see the following table). It suggested here that the market shares should be considered cumulatively over a period of five years (2000 to

²³ See question 1 of the request for information of 10.3.2005.

²⁴ [...] ^{*}

²⁵ [...] ^{*}

2004) as they vary widely from year to year. For a number of years, according to its own information, Voith Siemens made no sales in the EEA.

Equipment for hydro power stations: data provided by Siemens in the notification

EEA market shares (%) 2000-04	Equipment total
	Value (EUR)
	1999-2004
Voith Siemens	[20-30]*
VA Tech	[20-30]*
Total	[40-50]*
Alstom	[10-15]*
GE Hydro	[10-15]*
Ansaldo/Franco Tosi	[<2]*
Andritz	[<2]*
Others	[30-40]*

Source: Siemens in the notification.

- (34) VA Tech, by contrast, puts Siemens' and VA Tech's joint share of the market at [40-50]*% (Voith Siemens [10-15]*%, VA Tech [30-40]*%, Alstom [15-20]*%, GE Hydro [15-20]*%, Others [20-30]*%).³³ Alstom estimates that Siemens/VA Tech would jointly account for 61% of EEA sales of hydroturbines. In the case of electrical equipment, it estimates Siemens'/VA Tech's share of EEA-wide sales as being 43%.³⁴ The market share estimates of the other competitors and customers are generally within the same range, even if the estimates of smaller competitors in particular show fluctuations in both directions. For example, Andino estimates Siemens' and VA Tech's joint market share at 70%,³⁵ while Andritz puts it at only 41%.³⁶
- (35) On the basis of turnover figures for the competitors listed by Siemens, the Commission has carried out its own market share calculations. If one accepts here the volume of the turnover not attributed by Siemens to any competitor ("Others"), the market shares are as follows:

EEA 2000-04	€ million	Market share(%)
Siemens	[...]*	[10-20]*%
VA Tech	(*)	[30-40]*%
Combined	(*)	[...]*%
Alstom	(*)	[20-30]*%
GE Hydro	(*)]	[0-10]*%
Ansaldo	(*)	[<1]*%
Andritz	(*)	[<1]*%
Others	[...]*	[20-30]*%
Sum	(*)	100%

Source: Calculations by the Commission.

(*)These turnover figures are business secrets of the individual firms.

³³ See VA Tech's reply to question 35 of the "Questionnaire to Competitors - Power Generation".

³⁴ See Alstom's reply to question 35 of the "Questionnaire to Competitors - Power Generation" (#3680).

³⁵ See Andino's reply to question 35 of the "Questionnaire to Competitors - Power Generation" (#1310).

³⁶ See Andritz's reply to question 35 of the "Questionnaire to Competitors - Power Generation" (#1324).

- (36) From the turnover figures for competitors compiled by the Commission, just as in the case of the VA Tech estimate, it can be seen that Siemens has overestimated its own market share but underestimated that of VA Tech. Alstom achieves much higher market shares, while GE's market share is lower than that estimated by Siemens.
- (37) The notified concentration would therefore bring together two of the leading suppliers of hydroelectric power plant equipment. Voith Siemens/VA Tech would increase their market leadership considerably over the remaining competitors Alstom and GE. [20-30]*% of the market is not attributed to any competitor or is accounted for by very small suppliers or suppliers which supply only certain EboP components or services but are not active in the core areas of hydroelectric power.³⁷
- (38) Siemens argues³⁸ that, in the case of hydroelectric power plant equipment a competitive bidding market is involved and that market shares therefore "tell us very little". It quotes here from the Commission's decisions in Framatome/Siemens³⁹ and Siemens/Alstom Gas⁴⁰ as well as from the US Horizontal Merger Guidelines. The passages quoted indicate that (in view of the market strength given) market shares in competitive bidding markets must be treated with caution where orders are only rarely awarded. Furthermore, reference is also made to the number of credible suppliers for competition in a competitive bidding market. The passage quoted from the US Merger Guidelines is as follows: "Where all firms have, on a forward-looking basis, an equal likelihood of securing sales, the Agency will assign equal market shares." In the present case, however, it is neither a question of orders rarely being awarded, nor does anything indicate that there is an equally great probability of all the competitors named by the parties being awarded future tenders.
- (39) It should be noted that the fact that there is bidding on a market does not in itself allow any conclusion to be drawn as to the intensity of competition to be expected or as to the significance of market shares as an indicator of possible market power. The key factor is rather the bidding pattern in individual cases. For example, even where there is a small number of credible bidders, particularly intensive competition is to be expected if, in a bidding market, a large proportion of tenders is awarded in a few, large transactions and the products of the various competitors and their cost structure are largely homogeneous. In this and similar cases, market shares would, in practice, provide very little information on the possible market power of a bidder. The following remarks show, however, that the sources cited by the parties for the market for hydroelectric power plant equipment are not relevant.
- (40) Even if, in the market for hydroelectric power plant equipment there is a bidding market, various factors lead to the conclusion that the market shares of the various competitors in the current case do nevertheless say a great deal about their market strength. In particular, there are frequent tenders, often of a very small size. Only [...] of the [...] tenders submitted by Siemens had an order size of more than EUR [...]. As described in the notification (see *inter alia* p. 66), what is involved in

³⁷ These also include in particular ABB, which, according to Siemens' bidding data, regularly takes part in tenders in the EboP area but otherwise does not produce either hydroturbines or generators.

³⁸ In its reply to the Commission's Article 6(1)(c) decision.

³⁹ COMP/M.1940.

⁴⁰ COMP/M.3148.

the case of hydroelectric power plant equipment are individual components which are customised to suit the order in question. The heterogeneity of the products supplied by different manufacturers, the large variety of different components and the varying esteem in which the competitors are held by different customers (see below) show that the market is characterised by clear product differentiation.

- (41) For larger projects there is also *ex ante* uncertainty about the actual profitability of a project for the winner of an invitation to tender as the exact costs are subject to certain technical and legal imponderables.⁴¹ In a tender, therefore, the expected value of the lowest bid rises if the number of credible bidders goes down.
- (42) The market shares of Siemens, VA Tech and their competitors are consequently the result of over [...] real purchasing decisions by many customers over the five-year period in question. They also reflect the decisions of competitors to make a bid for a certain tender. Assuming maximisation of profit, the decision of whether to make a bid or not is based on a weighing-up of the costs which would be incurred and the probability of having a real chance with a given customer.⁴² In view of the large number of tenders, it must be assumed that the market structure observed did not come about by chance but is the result of the product portfolios offered by the different manufacturers, their installed base, their cost structure and similar differentiation features, as well as customer preferences. The market shares therefore contain considerable information about the market strength of the different suppliers, i.e. their ability to take part successfully in future tenders as credible bidders.
- (43) Consequently, the high joint market shares of Voith Siemens and VA Tech, as well as the wide gap between them and the only significant remaining competitors, Alstom and GE, already suggest that the notified concentration is likely to lead to a considerable lessening of effective competition in the common market (dominant position of Siemens/VA Tech). The number of credible suppliers would be reduced from four to three. This assessment is not weakened but, on the contrary, reinforced by the concerns voiced by numerous customers and competitors that the concentration would lead to a lessening of competition, as well as well as by the analysis of the tendering data submitted by Siemens, VA Tech, Alstom and GE Hydro.

(b) Market investigation and internal documents

- (44) The following were contacted for the market investigation: the customers in the EEA named by Siemens in the notification, the competitors named by Siemens, the customers named by VA Tech and the 50 largest hydroelectric power station operators in the EEA, this list also being compiled by Siemens. Of the latter, however, several said that they did not operate any hydroelectric power stations. Of the competitors outside Europe, only [...] replied. Both among those customers who replied and among the competitors a large number (and numerically a clear majority) expressed concerns that the notified concentration would lead either to "anti-competitive effects" or to higher prices. A number of customers and competitors said that they could not foresee the effects on competition or were not

⁴¹ See *inter alia* Alstom's reply to question 7 of the "Questionnaire to Competitors - Hydro Power".

⁴² [...]*

active in the hydroelectric power market. On the other hand, there were hardly any positive reactions.

- (45) It is clear from the market investigation and from the internal documents of Voith Siemens and other competitors that Siemens, VA Tech, Alstom and GE Hydro are together perceived in the market as a group of competitors who clearly stand out from the other suppliers as regards product portfolio and market penetration. In the respective competitor analyses the other suppliers in the EEA are totally ignored. [...]*⁴³
- (46) It was already clear from the answers to the Commission's questionnaires in Phase I that Siemens, VA Tech, Alstom and GE Hydro were viewed in the question on strengths and weaknesses⁴⁴ as being suppliers with the strongest product ranges while mainly attributes such as a lack of flexibility, high price and similar factors were deemed to be weaknesses. It was clear already from these replies that the other competitors were viewed as being much weaker or the relevant boxes were not filled in.
- (47) The Phase II questionnaires were intended to quantify the market position of the individual competitors more accurately. The question to customers was:

"How would you rate the following suppliers of hydro power equipment, in terms of know-how and market penetration **relative to VA Tech**? Please use the following grading system:

⁴³ [...]*.

⁴⁴ Question 37 of the "Questionnaire to Customers - Power Generation" and question 42 of the relevant competitor questionnaire.

- +2 - This competitor is significantly stronger than VA Tech in this area.
- +1 - This competitor is somewhat stronger than VA Tech in this area.
- 0 - This company is comparable to VA Tech in terms of know-how and market penetration.
- 1 - This competitor is somewhat less strong than VA Tech in this area.
- 2 - This competitor is significantly weaker than VA Tech in this area.

Competitor	Hydro power equipment generally	Hydro turbines	Hydro generators	Mechanical balance of plant (e.g. valves, gates, pipes etc.)	Electrical balance of plant (e.g. pumps, transformers etc.)	Services
Alstom						
Voith Siemens						
VA Tech

"

(48) The evaluation of the replies of the 25 customers who filled out the table produced the following result for "hydro equipment generally" (9 = do not know the competitor, no business relationship, no reply or something similar):

Customer assessment of competitors

Competitors	Hydro power equipment generally					
	2	1	0	-1	-2	9
Alstom	4%	8%	56%	28%	0%	4%
Voith Siemens	8%	16%	52%	16%	0%	8%
VA Tech	0%	0%	100%	0%	0%	0%
GE Hydro	4%	12%	40%	20%	0%	24%
Ansaldo	0%	0%	4%	20%	4%	72%
Franco Tosi	0%	0%	0%	24%	4%	72%
Andritz	0%	0%	12%	16%	12%	60%
Andino	0%	4%	0%	12%	12%	72%
Toshiba	0%	0%	8%	8%	4%	80%
Hitachi	0%	0%	8%	8%	4%	80%
Dongfang	0%	0%	0%	4%	8%	88%
Harbin	0%	0%	0%	4%	8%	88%

BHEL	0%	0%	0%	4%	4%	92%
------	----	----	----	----	----	-----

The evaluation of the table above shows first of all that all the respondents, as asked, gave their assessment relative to VA Tech (100% grade "0"). The assessment of Siemens, Alstom and GE Hydro is symmetrical to VA Tech, which means that approximately the same number of customers rate this competitor as being as strong or stronger/less strong. On average, Voith Siemens is rated slightly more highly than Alstom and GE Hydro. All other competitors are rated either very much lower or are unknown to the customers surveyed. The latter applies in particular to all non-European suppliers.

- (49) An even more detailed evaluation of the data further reveals that, in the area of hydrogenerators, Alstom is considered to be the strongest supplier among the four market leaders, while Voith Siemens, followed by VA Tech, is given the highest ratings for turbines.⁴⁵ This customer assessment would be in line with Alstom's reply to the Commission's questionnaires, according to which Siemens and VA Tech had the leading hydroturbine technology. This result is obtained by aggregating the customer assessments. Although the evaluation also stands up to a sensitivity analysis regarding the method of aggregation,⁴⁶ because of the small number of customers on which it is based it can provide only indications. The one reliable result of the evaluation of the Phase II questionnaires remains the finding that Siemens, VA Tech, Alstom and GE Hydro form a leading group, from the point of view of customers, as regards know-how and market penetration and, as such, clearly stand out from all the other competitors. [...]*
- (50) The competitors' replies to the relevant question of the Phase II questionnaire come to the same result. However, a quantitative aggregation is not a straightforward matter here, as the assessments are in each case carried out in relation to the respondent's own company.⁴⁷ Reference is therefore made to the competitors' individual replies. However, the division between Voith Siemens, VA Tech, Alstom and GE Hydro, on the one hand, and the other competitors, on the other, is clear here too.

(c) Tendering data

- (51) In a subsequent step the Commission analysed bidding lists submitted by Siemens, VA Tech, Alstom and GE Hydro in order to obtain further information about the closeness of the competitive relationship between Siemens, VA Tech and the other competitors. An examination of the market shares suggests that Siemens and VA Tech are frequently in competition with each other in tenders. If this were not the case, it might be that the two companies did not supply close substitutes, e.g. because they covered different segments of the market. This could lead to the conclusion that the market share addition observed exaggerates the actual effect on competition. The analysis is based on the assumption that companies take part in particular in those tenders which they think they have a chance of winning, e.g. because they are able to meet the tender specifications.

⁴⁵ See Excel tables prepared by the Commission "Siemens_Ranking by Customers".

⁴⁶ Ditto: cf. working papers "Results, generators" and "Results, turbines".

⁴⁷ The question put was: "How would you rate the following suppliers of hydro power equipment, in terms of know-how and market penetration **relative to your own company?**".

As participation in tenders involves costs, this hypothesis is consistent with the assumption of profit maximisation. [...] ⁴⁸

- (52) Ideally, the bidding data should be evaluated on the basis of an aggregated list of all competitors. However, this was not possible for two reasons. In the first place, both VA Tech and also Alstom and GE Hydro class their bidding lists as being confidential. Secondly, it is not possible to assign the four bidders to a single bidding list in many cases. This is because the respective tenders appear in the various lists under different descriptions. Even the tendering date varies in most cases. Even when there are similar project names, it is often not clear whether the same tender is involved or different lots within the same project.
- (53) The Commission therefore first analysed separately the bidding data submitted by Siemens. The Siemens data include [...] * tenders, of which only [...] * have a value of more than EUR [...] * . Of these, participating competitors are named in [...] * cases. This reveals the following:

Participation in tenders in the EEA (Siemens data)

Voith Siemens	VA Tech	Alstom	GE Hydro	Andritz	Kössler	F. Tosi	ABB	Others	[...]*	[...]*	[...]*	[...]*	[...]*	[...]*
[...]*	[...]*	[...]*	[...]*	[...]*	[...]*	[...]*	[...]*	[...]*	[...]*	[...]*	[...]*	[...]*	[...]*	[...]*

[...]*

- (54) [...] * The following chart compares the geographical profile of the four companies, with the names of the countries on the x-axis being removed for reasons of confidentiality. The y-axis shows the percentage of bids accounted for by each country.

Geographical profile of participation in tenders

[...]*

⁴⁸ [...] *.

- (55) The bidding data examined show that Siemens and VA Tech are the bidding companies which most frequently come into direct competition with each other. [...] *GE Hydro is currently tending to reduce its presence in Europe.⁴⁹ With the notified concentration, Siemens would therefore take over its most direct competitor in the EEA.
- (56) The evaluation of the replies to the Commission's requests for information and of the tender documents consequently confirms that the proposal would result in a significant impediment to competition, in particular as a result of the creation of a dominant position for Siemens.

(d) The parties' arguments (dynamic effects/potential competition)

- (57) During the in-depth market investigation the Commission informed Siemens of the results of its findings, including at two discussions in Brussels on 23 March and 15 April 2005. In response to the first of these meetings, the parties submitted on 8 April 2005 a written pleading⁵⁰ in which they argued on the basis of dynamic aspects that, although the notified concentration did reveal a need for adjustment on the part of customers for equipment for hydroelectric power stations, the concentration would not result in a significant impediment to effective competition. Although the "dynamic process of worldwide consolidation" which was taking place meant inconvenience for customers since long-established supplier relationships would be affected, there were alternative suppliers which the customers could turn to at a reasonable cost. The written pleading was followed by the other documents of 12 April⁵¹ (received by DG COMP on

⁴⁹ See e-mail from Scottish Southern of 11 April 2005 referring to the relocation of GE's hydro management centre from Oslo to Quebec, Canada, and the downgrade of its Doncaster (UK) site.

⁵⁰ #6661.

⁵¹ #7020.

14 April) and of 13 April 2005⁵² and, finally, by the parties' reply to the statement of objections, in all of which a similar line of argument is pursued.

- (58) The alternative suppliers cited by the parties are mainly small suppliers from the small-hydro segment, service firms, manufacturers of small components (e.g. fittings or electrical parts) which can also be used in hydroelectric power stations, and smaller companies outside Europe. The firms listed in the written pleading of 12 April 2005 extend far beyond the companies identified as "competitors" in the notification. Siemens argues "that the majority of the orders awarded in Europe may involve a great many individual aspects of work from the area of modernisation and maintenance, for which, in turn, a great many suppliers are available." Siemens also says that: "Small specialised suppliers too are a competitive force in the market. As the procurement of equipment for hydroelectric power stations and also the awarding of maintenance and modernisation contracts take place as part of a tendering procedure, the very existence of the suppliers referred to here constitutes a 'credible threat' for companies such as Voith Siemens, Alstom, GE Hydro and VA Tech." The individual aspects of work are also specified in the written pleading. These include hydroelectric power station components such as turbine and generator parts as well as maintenance work such as checking for cracks, cleaning, replacing seals, total overhauls and similar activities.⁵³
- (59) [...]*
- (60) The documents submitted by the parties confirm the Commission's findings that in the market for hydroelectric power station equipment in the EEA, in addition to the four market leaders, there is also a fairly large number of small companies which provide the small-hydro segment with relatively standard products, as well as maintenance and service companies and small component manufacturers which are entrusted with the small projects described by the parties. The company Andino Hydropower, highlighted by the parties, is an example of this category of company. Andino's reply to the Commission's market survey in Phase I does not contain any business secrets and is therefore fully accessible to the parties.⁵⁴ The reply to the Phase II questionnaire is also partly accessible.⁵⁵ In 2004 the company had an annual turnover of EUR [...]*. In the period 2000-04 the EEA market share was [less than 1]*%. True, there is nothing to suggest that Andino is not a successful supplier of hydroelectric power products, in particular in the small-hydro segment. Andino itself says that its proximity to the customer and flexibility ("to travel with lighter baggage") is an advantage compared with VA Tech. But at the same time the company states: "Andino is simply a too small company for being considered as a competitor to the leading suppliers."
- (61) The same applies to the other companies listed by Siemens as credible bidders, whose size in terms of turnover amounts to significantly less than 1% of Siemens/VA Tech. They would have to increase their turnover by a factor of 50-100 to match the order of magnitude of VA Tech. In order to do this, they would have to develop further the relevant product portfolio with references outside the small-hydro area.

⁵² #6955.

⁵³ #7020.

⁵⁴ See Andino's reply to the questionnaire "Questionnaire to Customers - Power Generation", #1310.

⁵⁵ See Andino's reply to the questionnaire "Questionnaire to Customers - Hydro Power", #4733.

- (62) Nor, finally, is there any credibility in the argument put forward by the parties at various points that the notified concentration is part of a "dynamic process of the worldwide consolidation of manufacturers"⁵⁶ in which the European market (with a 10% share of the world market) is of negligible importance.⁵⁷ Apart from the fact that the relevance of this argument for the analysis of competition remains unclear, the concentration with VA Tech would eliminate a competitor which is mainly active in Europe and has a leading market position there. With the notified transaction Siemens would take over its most important competitor in the EEA.

(e) Conclusion

- (63) To summarise, the high joint market shares of Siemens and VA Tech, the wide gap between them and the rest of the competitors, the elimination of a leading credible bidder in the market for hydroelectric power station equipment, the fact that the concentration would bring together two close, probably indeed the closest, competitors and the absence of credible potential competitors all point to the conclusion that the notified proposal would result in a significant impediment to effective competition in the common market through the creation of a dominant position for Siemens/VA Tech. These conclusions are based on the market information submitted by numerous customers and competitors as well as on the competition concerns voiced by them, the analysis of the tender data submitted by Voith Siemens, VA Tech, Alstom and GE Hydro, and internal documents of Voith Siemens.⁵⁸

A2. EQUIPMENT FOR GAS-AND-STEAM POWER STATIONS

1. Relevant product markets

- (64) In the area of equipment for fossil-fuel power stations, the activities of Siemens and VA Tech overlap only in the case of certain components for gas-and-steam power stations. VA Tech's product range here is much narrower than that of Siemens. VA Tech essentially supplies turnkey gas-and-steam power stations using mainly components supplied by third parties. VA Tech's turnkey supply is based on turbines supplied by GE as key components, which are combined with turbo generators from its own in-house production. As part of the cooperative arrangement, VA Tech also supplies generators to GE for projects being carried out by GE. Nor does VA Tech itself manufacture steam turbines and other power station components.
- (65) Siemens therefore argues that the only market affected by the notified concentration is the market for turnkey gas-and-steam power plants. This involves integration and engineering services through which the numerous components of a power station are integrated to form a turnkey plant.
- (66) The notifying party does not attribute any significant market shares to VA Tech for the GE turbines distributed by it (since the demand relates to GE turbines and not to supply by VA Tech), nor does VA Tech appear in Siemens' presentation as a market participant for generators (since these are supplied solely as part of turnkey projects

⁵⁶ Siemens' letter to the Commission of 8 April 2005, #6661.

⁵⁷ See *inter alia* p. 26 of the notification.

⁵⁸ These are supplemented by the confidential internal documents of other market participants, which are therefore not available to Siemens.

or through GE). Nevertheless, an objective market definition is proposed in the case of turbines on the basis of the Commission Decision in Siemens/Alstom Gas & Steam Turbines (M.3148). According to that decision, a separate market exists for large gas turbines with an output of over 60 MW. According to Siemens, all the turbines affected by the concentration belong to this market.

- (67) The Commission's market investigation essentially confirmed Siemens' proposed market definition for turnkey gas-and-steam power plants.
- (68) Siemens' proposed market definition for large gas turbines was also confirmed (although, in some cases, 50 MW was proposed as the lower limit). The basis for the subdivision is the observation that gas turbines with an output of under 60 MW (50 MW) derive from aircraft turbines. The question of whether the precise lower limit for large gas turbines should be 50 MW, 60 MW or another output level can be left open here since it does not affect the assessment of competition.
- (69) Siemens does not give any more detailed definition of the generator market since it disputes that VA Tech is a market participant here. The market investigation indicates that, on the demand side at least, it might be necessary to draw a distinction between turbo generators for gas-and-steam power plants and other generators and possibly, in addition, to establish a subdivision by size category. Gas and steam turbo generators differ from other types of generator through their high turning speed, which requires a particular design. However, the market definition can be left open here since it does not affect the assessment of competition.

2. Relevant geographic markets

- (70) For the definition of the relevant geographic markets, Siemens refers to the Commission Decision in Siemens/Alstom Gas & Steam Turbines (M.3148). In that case, the notifying party (Siemens) argued that the relevant geographic market was at least EEA-wide and indeed probably worldwide. The Commission did not have to examine the market definition any further in Siemens/Alstom and therefore left it open. In the present case, the definition of the relevant geographic markets can also be left open since it has no impact on the assessment of competition.

3. Competition assessment

- (71) In the market for turnkey gas-and-steam power plants, the joint annual market share of Siemens and VA Tech in the EEA between 1999 and 2003 amounted, according to Siemens, to between [5-10]*% and [15-20]*%. Taking the period 1999-2003, the average combined market share was [10-15]*%, of which only [2-5]*% was accounted for by VA Tech. In the turnkey market, a number of suppliers would remain even after the notified merger. These include the turbine manufacturers Siemens (or Siemens/VA Tech), Alstom and Mitsubishi, but also engineering firms such as Bechtel and others, as well as the boiler manufacturer Foster & Wheeler. In the market for turnkey steam-and-gas power plants, the merger would not therefore, at horizontal level, give rise to any competition concerns.
- (72) The Commission's market investigation confirmed that VA Tech operates as a turnkey supplier of gas-and-steam power plants on the basis of turbines made by GE and turbo generators from its own in-house production. It seems to be customary and technically necessary for gas turbines and turbo generators to be matched technically

to one another and supplied as a package. The market investigation also confirmed that VA Tech does not fundamentally operate separately as a supplier of generators but supplies them for turnkey projects, together with turbines made by GE. Horizontally, therefore, there is no addition of market shares in the case of generators.

- (73) VA Tech does not manufacture gas turbines. Horizontally, therefore, there would be no overlaps here. The merger as notified would deprive GE, the world market leader for gas turbines, of a sales channel for these products in the form of VA Tech. GE (like Siemens, Alstom and Mitsubishi) also has its own generator production capacities. Given the role of gas turbines as key components in gas-and-steam power plants and given GE's leading market position in that area, it appears unlikely that GE would, as a result of the notified concentration, be deprived of access to the gas turbine market, nor did GE itself express any concerns in this respect in the market investigation.
- (74) Accordingly, the notified transaction does not, in the area of equipment for gas-and-steam power plants, result either horizontally or vertically in a significant impediment to effective competition in the common market or in a substantial part thereof.

B. POWER TRANSMISSION AND DISTRIBUTION ("T&D")

1. Relevant product markets

- (75) Like power generation equipment, the T&D market comprises a wide range of different components that are supplied individually or integrated into a system. Customers are mainly national grid operators and local/regional electricity distributors. In the T&D area too, Siemens has a wider range of component manufacture than VA Tech, which, in the case of turnkey projects, relies more heavily on external suppliers.
- (76) On the basis of the horizontal overlaps in the product range, Siemens proposes that relevant product markets be defined on the basis of the product groups listed under (a) to (e) below. According to Siemens, the area of energy automation and information systems forms an exception, with power system management and protective relays each constituting a separate market.

(a) High-voltage products (for transmission networks operating at voltages between 52 kV and 800 kV)

- (i) air-insulated switchgear
- (ii) gas-insulated switchgear
- (iii) circuit breakers
- (iv) disconnectors
- (v) instrument transformers
- (vi) coils

(b) Transformers

- (i) power transformers
- (ii) distribution transformers

(c) Energy automation and information systems

- (i) power station management
- (ii) protective relays

(d) Turnkey projects

- (i) high-voltage projects
- (ii) medium-voltage projects

(e) T&D services

- (i) asset services
- (ii) network planning

- (77) The market investigation largely confirmed the structuring of T&D markets proposed by Siemens (on the basis of the Commission Decision in Areva/Alstom (M.3296)). However, the market investigation also showed that T&D products are not only demanded as turnkey projects but that in the case of many customers there is also a demand for individual components. Purchasing policy is essentially customer-specific. Large national grid operators in particular have their own project management skills and undertake the integration of individual components themselves. Other companies have shed such activities and their demand relates mainly to turnkey projects. Market transactions therefore exist both for turnkey projects and for individual components (as regards the latter, both between component manufacturers and customers and between component manufacturers and turnkey integrators).
- (78) Since the structure of suppliers differs distinctly as between the individual components and since the various components are not substitutable, relevant product markets could exist both in the turnkey area and also at the level of the individual components. The product groups identified in paragraph (76) under (a) to (e) as (i) to (vi) would thus represent possible separate relevant product markets. This analysis was only partly confirmed by the market participants surveyed. Some customers and competitors stated in their answer to the relevant question that a market definition in terms of the general product groups was sufficient. This assessment seemed, however, to be not always based on a competition-law analysis, but frequently on a technical classification. The precise product market definition can, however, be left open in this case since it does not affect the competition assessment.
- (79) According to the Commission's enquiries, VA Tech, like Siemens, also operates in air-insulated and gas-insulated switchgear in the medium-voltage area, through its subsidiary Elin EBG. The question of whether each of these products constitutes a separate relevant product market or forms part of a wider market for MV products as a whole (similar to the overall market for HV products proposed by Siemens) can also be left open here. Whatever the relevant product market definition, the merger does not give rise to any competition concerns in this area too, which as a much less concentrated market structure than the HV sector.

2. Relevant geographic markets

- (80) Siemens argues that the relevant geographic markets in the T&D area are to be defined "after the liberalisation of energy markets as at least EEA-wide and in part possibly even worldwide". It states that there are international tenders for T&D projects in which "the traditional 'home advantage' of domestic suppliers scarcely plays any role". Furthermore, it argues, transport costs are small, international trade

is intensive, there are globally active suppliers and technical standards, and customers' internal certification procedures no longer represent significant trade barriers.

- (81) The market investigation indicates that national grid operators have indeed increasingly opened up to supplies from outside their traditional group of suppliers. Technical standards seem no longer to pose any significant trade barrier, and internal certification procedures too are ultimately in the hands of the customer. This applies in particular to the high-voltage area, which is the area in which the parties' activities mainly overlap and in which projects are, in any case, significantly customised. However, a local presence in the country of the relevant customer seems to continue to play a role in the case of national grid operators when awarding contracts. Suppliers that do not have any production capacity in the EEA (e.g. those from Japan) seem not so far to have bid to any significant extent for T&D projects in the EEA, even in cases in which they were encouraged to do so.
- (82) In so far as national differences continue to exist in the structure of supply and demand in the T&D markets, they are attributable essentially to the purchasing policy of a few large customers. In France in particular, EDF seems in some product markets to continue to be inclined to purchase from national suppliers. The main producers of T&D products are, however, all active throughout the EEA, a fact reflected both in participation in tenders and in successful bids. Consequently, the T&D markets are EEA-wide.

3. Competition assessment

(a) Market structure

- (83) In the T&D area, according to the information provided by the notifying party, the activities of Siemens and VA Tech overlap in the areas set out in the following table. On the basis of the data contained in the notification, the market shares are as follows:

EEA market shares 2003 (% , value)

Product	Siemens	VA Tech	Combined	Main competitors
a. High-voltage products	[15-20]*	[5-10]*	[20-30]*	Areva [15-20]*, ABB [15-20]*
(i) Air-insulated switchgear	[5-10]*	[5-10]*	[15-20]*	Areva [10-15]*; ABB [5-10]*; Cegelec [5-10]*, EFACEC [5-10]*
(ii) gas-insulated switchgear	[30-40]*	[10-15]*	[40-50]*	ABB [30-40]*, Areva [20-30]*
(iii) circuit breakers	[30-40]*	[5-10]*	[40-50]*	Areva [30-40]*, ABB [20-30]*
(iv) disconnectors	[30-40]*	[20-30]*(*)	[30-40]*/ [50-60]*	Areva [20-30]*, HAPAM [10-15]*
(v) instrument transformers	[10-15]*	[5-10]*	[15-20]*	Areva [20-25]*, ABB [10-15]*, Ritz [10-15]*, Artech [10-15]*, Pfiffner [0-10]*
(vi) coils	[20-30]*	[10-15]*	[30-40]*	Areva [20-30]*, ABB [15-25]*, Trafomec [5-10]*
b. Transformers	[10-15]*	[5-10]*	[20-30]*	ABB [15-25]*, Areva [15-20]*, RWE Solutions

				[5-15]*, Schneider [0-10]*, Pauwels [0-10]*, others
(i) power transformers	[10-15]*	[10-15]*	[20-30]*	ABB [20-25]*, Areva [15-25]*, RWE Solutions [5-15]*, Pauwels [2-5]*, EFACEC [2-5]*, others
(ii) distribution transformers	[10-15]*	[2-5]*	[10-15]*	ABB[10-20]*, Schneider [5-15]*, RWE Solutions [5-15]*, Areva [5-15]*, Pauwels [5-10]*, others
c. Energy automation and information systems				
(i) power system management	[10-15]*	[10-15]*	[20-30]*	ABB [10-15]*, Areva [5-10]*, others (including various software companies)
(ii) protective relays	[20-30]*	[<2]*	[20-30]*	Areva [20-30]*, ABB [10-20]*, Schneider [0-10]*
d. Turnkey projects				
(i) high-voltage projects	[50-60]*	[10-15]*	[60-70]*	ABB [15-20]*, Areva [10-15]*, Cegelec [5-10]*
(ii) medium-voltage projects	[10-15]*	[<2]*	[10-15]*	ABB [15-20]*, Areva [15-20]*, Cegelec [10-15]*
e. T&D services				
No affected markets on EEA or national basis				

[...]*(*)

- (84) The market investigation confirmed that there are essentially four competitors (Siemens, VA Tech, ABB and Areva) which produce a comparably wide range of T&D components and operate as turnkey suppliers in high-voltage projects. [...]*
- (85) Several other competitors, including Cegelec, EFACEC, Ansaldo, HAPAM, Pauwels and others, cover only individual tentative product markets. They supply individual components either direct to final customers or as subcontractors to turnkey suppliers.
- (86) On the basis of the product market definition proposed by Siemens and of the market share figures contained in the notification, the combined market share in high-voltage products, transformers, power system management and protective relays is always [20-30]*% or less. In the market for turnkey projects, the combined market share would be [20-30]*%. In each of these markets, even after the merger, four or more credible competitors would remain. The same applies to medium-voltage switchgear, where, in addition to Siemens, VA Tech, ABB and Areva, a number of other suppliers exist.
- (87) On the basis of the tentative smaller product markets identified above (see section 1 on relevant markets), market shares are sometimes significantly higher. In the case of high-voltage turnkey projects, the combined EEA market share of Siemens and VA Tech in 2003 amounted to [60-70]*% (Siemens [50-60]*%, VA Tech [10-15]*%).
- (88) The merger also leads to high market shares in a number of (tentative) component markets, particularly in the case of gas-insulated switchgear ([40-50]*% market

share), circuit breakers ([40-50]*%) and coils ([30-40]*%), with VA Tech in each case having a much smaller market share than Siemens. In the case of a separate market for disconnectors, Siemens would acquire the 40% (non-controlling) shareholding which VA Tech still holds in the business area otherwise sold to Southern Company.

- (89) The customers and competitors surveyed in the market investigation confirmed the identity of the competitors listed by Siemens in the various product areas and their market shares, albeit with some differences in estimates of market shares. In particular, no other market participant estimated the market share of Siemens and VA Tech in the high-voltage turnkey area as high as Siemens itself [...]*. This might be because the allocation of turnover to turnkey business (in contrast to the supply of the underlying components) is difficult at individual level and is handled differently by the market participants. As explained in paragraphs (93) to (95), however, market shares in the high-voltage turnkey market are of only minor importance for the competition assessment.

(b) Non-coordinated effects

- (90) As in the hydro market, Siemens argues that market shares in the T&D markets do not provide any direct information on suppliers' market power because orders are awarded through tenders. It also argues that, in the wake of deregulation and privatisation in recent years, energy supply companies have developed a strong awareness of costs which is reflected in the demand that suppliers provide "massive" discounts.
- (91) The Commission examined in particular the effects of the notified merger in the possible product markets for high-voltage turnkey projects, gas-insulated switchgear and circuit breakers as part of the more detailed market investigation. It should be borne in mind here that the horizontal overlaps between Siemens and VA Tech in the high-voltage turnkey market are, to a substantial extent, attributable to GIS-based turnkey substations. Circuit breakers are used as components *inter alia* in gas-insulated switchgear. The same applies to disconnectors, although these are comparatively less technology-intensive. These (tentative) product markets are therefore, to a significant extent, vertically linked, with Siemens, VA Tech, Areva and Alstom each being active at all three levels.
- (92) Some of the customers and competitors surveyed in the market investigation expressed concern at the notified merger, although the proportion of negative reactions was much lower than, for example, in the case of hydropower (see Section A). Competition concerns expressed by the customers surveyed were based in particular on the observation that the transaction would eliminate a further credible competitor in an already highly consolidated market. The market investigation therefore focused on determining whether the high combined market shares of Siemens/VA Tech and the reduction in the number of credible bidders from four to three in some tentative product markets would result in a significant impediment to effective competition, in particular through the creation of a dominant position.
- (93) In the (tentative) market for high-voltage turnkey projects in the EEA, Siemens already had a market share of [50-60]*% in 2003 alone. Together with VA Tech ([10-15]*%), the combined market share would have been [60-70]*%. The rest of

the market was divided between ABB ([20-30]*%) and Areva ([5-10]*%). However, the high-voltage turnkey market is heavily project-driven, and the bulk of turnover in a given year may be generated by a small number of large projects. Accordingly, the market shares of Siemens, VA Tech, ABB and Areva fluctuate widely over time. In the five-year period from 1999 to 2003, Siemens' market share fluctuated between [5-10]*% (2000) and [50-60]*% (2003). VA Tech's market share in the same period ranged between [<2]*% (1999) and [15-20]*% (2002). ABB and Areva accounted for the remaining market shares in each year. [...] It may be concluded from the wide fluctuations from year to year in market shares and the importance attaching to individual projects that the market for high-voltage turnkey projects is indeed a project-driven market in which the market shares of the individual competitors, in so far as they regularly take part credibly and successfully in tenders, cannot automatically be used to draw conclusions regarding their market power. Customers and competitors seem to perceive Siemens, ABB, Areva and VA Tech consistently as credible competitors who largely offer comparable products.

- (94) Other competitors did not achieve any significant turnover in the EEA between 1999 and 2003. The Japanese suppliers Toshiba-Mitsubishi and JAEPS participated only in tenders in Iceland and Cyprus, although they were rated as competitive suppliers by several customers at product level. However, they do not seem to have participated in tenders in the EEA apart from Iceland and Cyprus even though there was customer encouragement.
- (95) As an interim conclusion it may thus be said that the (tentative) market for high-voltage turnkey projects in the EEA is a highly project-driven market and that the notified merger would reduce the number of credible competitors in that market from four to three. Against this background, the merger could result in a significant impediment to effective competition especially if Siemens and VA Tech were rated by a substantial number of customers as first and second choice in their product preference or if the two companies were, because of their cost structure, particularly keen competitors against one another in tenders. The answers given by customers and competitors to the Commission's market survey did not provide any initial indications of any such scenario. Other indications might be provided by the bidding behaviour of Siemens and VA Tech.
- (96) If, from the customers' point of view, Siemens and VA Tech supplied close substitutes compared with other competitors, the expectation would be that they would take part in a substantial number of tenders as competitors. [...] In nearly all of these tenders, ABB and/or Areva also submitted bids. ABB and then Areva are the companies which by far bid most frequently in direct competition with Siemens. [...]
- (97) The same bidding analysis as for high-voltage turnkey projects was also carried out for gas-insulated switchgear and for circuit breakers. All the tenders identified by Siemens and, as far as possible, aligned with competitors' data for the period from 1999 to the beginning of 2005 were examined. [...] As previously, ABB and/or Areva also submitted bids in the case of gas-insulated switchgear and circuit breakers in almost every tender in which Siemens and VA Tech participated. ABB and then Areva are here once again and by a wide margin the companies bidding most frequently in direct competition with Siemens. As mentioned above, gas-insulated switchgear products form the basis of a substantial proportion of high-voltage turnkey projects.

- (98) The Commission then went on to analyse the bids by Siemens, VA Tech, ABB and Areva in the [...] tenders for the period from 1999 to 2003 for gas-insulated switchgear and turnkey gas-insulated switchgear,⁵⁹ in which, according to their information, all four competitors participated. The aim was to ascertain whether Siemens and VA Tech possibly were the lowest and second-lowest bidders in a significant number of bidding situations and thus, being in competition, had a particularly marked influence on the transaction price. However, this hypothesis too could not be confirmed on the basis of the data.
- (99) In the case of disconnectors and coils, the market investigation reached the same conclusion on the basis of more limited bidding data. In both (tentative) markets, compared with GIS and HV turnkey projects, there remains one other competitor. In the case of coils, this is Trafomec. In the case of disconnectors, the horizontal overlaps are confined to VA Tech's (non-controlling) [...] shareholding in the business. In addition, compared with GIS and HV turnkey projects, the products are much more standardised.
- (100) The Hungarian company Ganz-Transelektro has submitted several bids for GIS in the EEA since the country joined the European Union in May 2004 and has since won its first contract [...]. According to its own data, it is already active in other parts of the world, particularly the Middle East. By contrast, Japanese competitors still seem not to be engaging in competition in the EEA to any significant extent (with the exception of offshore islands such as Iceland and Cyprus).
- (101) To summarise, the situation is as follows: because of their structure, the (tentative) markets for HV turnkey projects, GIS and circuit breakers could produce competitive market results in principle even with only three credible bidders offering close substitutes (and one possible potential competitor). Neither the market survey nor the bidding analysis allows the conclusion to be drawn that the notified merger would result in a significant impediment to effective competition, notably through the creation of a dominant position. This analysis relates to possible non-coordinated effects of the notified merger.

(c) Coordinated effects

- (102) In addition, the elimination of a competitor from a market which, with only four suppliers, is already highly concentrated could allow the remaining firms to coordinate their competitive behaviour and thus, at the expense of their customers, achieve higher prices in tenders for HV turnkey projects, GIS and circuit breakers than in an independent submission of bids. Siemens/VA Tech, ABB and Areva would have to manage to find a coordination mechanism through which bids could be effectively coordinated. Deviations from the coordinated price would have to be evident to the other oligopolists and a credible deterrence mechanism would have to make any deviation unprofitable.⁶⁰

⁵⁹ As mentioned earlier, gas-insulated switchgear products form the basis of a large proportion of high-voltage turnkey projects. In the case of GIS projects, it is difficult in the case of some projects to allocate an individual price since the suppliers in some cases show the various components, services and options differently and separately. Other HV turnkey projects for which the various bids tended to be even more difficult to compare were therefore not included.

⁶⁰ See judgment of the Court of First Instance in Case T-342/99 *Airtours v Commission* 2002 ECR II-2585.

- (103) Any tacit coordination of bid prices in the various tenders involves considerable difficulties. In particular, individual HV turnkey projects, GIS and circuit breakers differ widely in their technical complexity and hence also in their price since each project is customised to meet the relevant customer's requirements. The products are therefore characterised by considerable non-homogeneity, and the market is thus not very transparent.
- (104) Nor is it possible from the market data and bidding data examined during the merger control procedure to identify any evidence of possible coordination mechanisms for behaviour in tenders. All four companies (Siemens, VA Tech, ABB and Areva) take part successfully in tenders practically throughout the entire EEA. The very complex coordination mechanism that would be necessary for coordinating competitive behaviour given the bidding pattern observed in this case would be difficult to maintain. There is no convincing evidence based on the data available of any coordination that already exists or would be brought about by the merger in the (tentative) markets for HV turnkey projects, GIS and circuit breakers.

(d) Conclusion

- (105) It follows that, whatever the product market definition applied, the notified merger would not, in the T&D area, lead to the creation or reinforcement of a dominant position or result in any significant impediment to effective competition.

C. RAIL

CI. ROLLING STOCK

- (106) The takeover of VA Tech by Siemens leads to overlaps in electrical traction systems for trams, underground trains, regional trains and electrical locomotives. In addition, vertically affected markets arise for trams, underground trains and electrical regional trains.

1. Relevant product markets

(a) Electrical traction systems for rail vehicles

- (107) Hitherto the Commission has examined the market in electrical traction systems for rail vehicles only for the purpose of an authorisation decision under Article 6(1)(b) of the Merger Regulation. In the Alstom/Fiat Ferroviaria Decision,⁶¹ a separate market was assumed for electrical traction, which was not, however, subdivided further. The drive train of an electrical rail vehicle essentially consists of four elements: the power converter, the traction engine, the transformer and the control system.
- (108) Either the manufacturer of a rail vehicle can buy these components individually and integrate them into the train itself, i.e. it possesses system-integration skills; for the individual components, in particular the traction motor, there are several independent suppliers. Or the manufacturer can acquire the complete drive train

⁶¹ See paragraph 31 of Commission Decision COMP/M.2069 Alstom/Fiat Ferroviaria of 18 September 2000.

from an electrical system integrator. Both Siemens and VA Tech's subsidiary Elin EBG Traction ("ETR") offer the construction and delivery of the complete drive train for the following four product groups: trams, underground trains, regional trains and locomotives. Suppliers of electrical traction also operate, as members of a consortium, under their own name in contacts with the customer, as in the case of the "Talgo 22" regional-train project.⁶²

- (109) Trams and underground trains obtain their power from a direct current network generally with 600 V to 750 V. Actual trains such as regional trains run on an alternating current network with higher voltages of up to 25 kV. From the point of view of customers, i.e. the non-integrated suppliers of rail vehicles, which manufacture only the mechanical part of a rail vehicle because of the different construction needed for the electrical traction of the various product groups such as trams, underground trains and regional trains, the tractions are not exchangeable.
- (110) In its reply to the statement of objections, however, Siemens argued that all the main suppliers, in particular the large integrated suppliers, have a portfolio that covers all areas of traction from trams to high-speed trains. Furthermore, according to Siemens, the electrical systems for the individual product groups do not differ technologically. The independent suppliers such as ETR and Vossloh-Kiepe ("Kiepe"), by contrast, specialise in specific areas and are not in a position to extend their production within a brief period of time to traction for high-speed trains. For the purposes of this Decision, therefore, electrical traction systems for rail vehicles are subdivided by product group into separate markets.

(b) Rail rolling stock

- (111) The market for electrical rail vehicles is downstream from the market for the electrical traction of rail vehicles. In the ABB/Daimler-Benz Decision,⁶³ the Commission subdivided the market for rail transport technology into five product groups (mainline trains, regional trains, local trains, wayside systems and miscellaneous), each of which contained the relevant individual product markets of electrical and diesel locomotives, electrical and diesel multiple units, passenger coaches and freight wagons, trams and underground trains, components, spare parts and maintenance. Trams, including urban railways, are sometimes referred to Light Rail Vehicles ("LRV").
- (112) In subsequent decisions, the question of whether regional trains had to be subdivided into electrical motor-trains (EMUs) including diesel-electric motor-trains and diesel motor-trains (DMUs) was left open since such a subdivision was not relevant.⁶⁴
- (113) ETR manufactures only electrical traction systems and is a competitor with Siemens only in this area. ETR's product range includes electrical traction for trams, underground trains, regional trains and locomotives. The relevant product market can be left open for the locomotives sector as the competition assessment does not change even assuming a separate market for electrical locomotives. The same

⁶² <http://www.talgo.de/talgo22.htm>.

⁶³ See paragraph 9 of Commission Decision IV/M.580 ABB/Daimler Benz of 18 October 1995.

⁶⁴ See paragraph 10 of Decision COMP/M.2139 Bombardier/ADtranz; even in ABB/Daimler Benz, this question was left open; see paragraph 75 of Commission Decision IV/M.580 ABB/Daimler Benz of 18 October 1995.

applies to regional trains, where the competition assessment does not change, even assuming a separate market for EMUs, including diesel-electric regional trains. This view is also taken by Siemens. Accordingly, for the purposes of this Decision, the relevant product markets are trams, including urban railways, underground trains, regional trains and locomotives, with the distinction in the case of locomotives between electrical and diesel traction being left open.

2. Relevant geographic markets

(a) Electrical traction systems for rail vehicles

- (114) In its Decision in ABB/Daimler Benz the Commission assumed a national market for the electrical part at least in the case of Germany.⁶⁵ In the later decision in Alstom/Fiat Ferroviaria, however, an EEA-wide market for subsystems, in particular electrical traction, was assumed.⁶⁶ Siemens argues that a restriction to national markets is not appropriate. It argues that there are sufficient examples of the supplier of the electrical part not originating in the country of the customer purchasing the rail vehicle. A system integrator of electrical traction such as ETR delivered supplies to Spain, for example, without having production facilities there. The market investigation confirmed this definition of the EEA market in the present case. All manufacturers of rail vehicles in the EEA, independent suppliers of electrical traction and component manufacturers were surveyed as part of the investigation. Only two companies took the view that national markets were involved in some member countries, although they did not further substantiate this. The Commission therefore assumes an EEA-wide market for electrical traction for rail vehicles.

(b) Rail rolling stock

- (115) In its decision-making practice to date, the Commission has accepted national markets for rail vehicles at least in those Member States in which there was a national supplier or national production capacity which met the demands of customers there. Germany, Belgium, France, Italy, the Netherlands, Sweden, Spain and Austria in particular were identified as national markets.⁶⁷ Other Member States, including Ireland and Greece, which do not have their own industry and therefore buy internationally, were included in a “rest of the EEA” market. In the present case there are horizontal overlaps or vertical links in Belgium, Germany, Austria, Poland, Spain and the Czech Republic, which all have their own production capacity.
- (116) Siemens argued that in recent years there has been a trend towards a uniform European market on account of the European contract award directives. In spite of recognisable signs of continuing Europeanisation, however, the information available to the Commission does not allow the conclusion to be drawn that an

⁶⁵ See paragraph 26 of Commission Decision IV/M.580 ABB/Daimler-Benz of 18 October 1995.

⁶⁶ See paragraph 19 of Commission Decision COMP/M.2069 Alstom/Fiat Ferroviaria of 18 September 2000.

⁶⁷ See IV/M.580 ABB/Daimler Benz, Commission Decision of 18 October 1995; IV/M.1064 Bombardier/Deutsche Waggonbau, Commission Decision of 29 January 1998; COMP/M.2139 Bombardier/ADtranz, Commission Decision of 3 April 2001.

EEA-wide market is appropriate for the assessment of the proposed concentration.⁶⁸ Even in the years since 2001, the year of the last Commission decision, national buying predominates in those Member States which have their own strong industry. For the most part, foreign firms are taken into account only through subsidiaries established within the country. Thus, in Austria, for example, contracts have been won only by the two suppliers Siemens and Bombardier, both of which, following earlier takeovers, have production capacities in the country. The same applies to Germany, where only Alstom, Bombardier, Siemens and Stadler have won orders for trams, underground trains and regional trains, all of these companies having their own production facilities in Germany as a result of earlier takeovers.

- (117) The market investigation confirmed this assessment. Apart from Siemens, only one other competitor took the view that the relevant market for the rail vehicles in question was the EEA, although a local presence in this industry was an advantage. All the others believed that the markets were national or saw the market as being in transition to a European market, with a national presence through manufacturing facilities continuing to be important.
- (118) For the purposes of this Decision, national markets have therefore been assumed for trams, underground trains, (electrical) regional trains and (electrical) locomotives in the case of those Member States which have their own strong rail vehicle industry. In the present case, these are Belgium, Germany, Austria, Poland, Spain and the Czech Republic.

3. Competition assessment

- (119) In the EEA there are eight fairly large suppliers of electrical rail vehicles as well as local suppliers of trams such as the Czech company Inekon or, as a new supplier, Leoliner Fahrzeugbau in Leipzig, which produced a new tram in 2003. Five of these suppliers are so-called systems producers, which are able to supply a complete train including electrical traction. These are AnsaldoBreda, Alstom, Bombardier, Siemens and Skoda. Four suppliers manufacture only the mechanical part. These are the two Spanish suppliers CAF and Talgo, Inekon and Leoliner. These four non-integrated manufacturers are not active over the whole product range. CAF does not manufacture electrical locomotives and Talgo does not manufacture trams or underground trains, while Inekon and Leoliner each manufacture only one tram.
- (120) Stadler was until 2001 a purely engineering firm but has in recent years developed into a systems producer by developing the ability to design the electrical traction for its trams and EMUs itself and to incorporate it into the vehicle using purchased components. Stadler does not supply underground trains or electrical locomotives. The other four non-integrated firms (CAF, Talgo, Inekon and Leoliner) must, in order to be able to supply a rail vehicle with electrical traction, find a supplier or cooperation partner for the electrical part. In principle, both the systems producers and independent suppliers of electrical traction could be considered for this.
- (121) Of the five systems producers, AnsaldoBreda does not sell its electrical traction systems to third parties, while Skoda has not yet had any success selling electrical

⁶⁸ “Analysis of the Rail Transportation Markets”, Expert report of Bearing Point, 2004, p.15: “At this stage, all subsegments have to be considered as national markets to be assessed. However, there is a clear trend towards Europeanisation for the highest technological sub-segments.”

traction systems in the EEA apart from in the Czech Republic. In addition to the three systems producers which do supply electrical traction for practically all types of rail vehicles to third parties, there are two independent European suppliers of complete electrical traction systems for rail vehicles which do not cover the whole product range. Kiepe, which belongs to Vossloh, manufactures only electrical traction for trams. The VA Tech subsidiary Elin EBG Traction ("ETR") supplies electrical traction for trams, underground trains, regional trains and electric locomotives.

(a) Trams

- (122) Siemens stated that on the market for **electrical traction** for trams in the EEA it had a joint market share with ETR of [20-30]*% (Siemens [5-10]*%, ETR [15-20]*%) in the period under consideration (1999-2003). According to Siemens, there was no overlap on a national basis. [...]*
- (123) In **Spain**, Siemens has, according to its own data, a market share in value terms of [20-30]*% for complete trams. The market leader is Alstom with [70-80]*%, while CAF has around [5-10]*%. The market investigation substantially confirmed these market shares. If we include 2004, there were 7 tenders for trams in Spain in the period from 1999 to 2004. Siemens and Bombardier each won [...]*, CAF [...]* and Alstom [...]*.
- (124) CAF won the order for the trams in Seville, which was awarded in 2004. It is fitting the 17 trams with traction manufactured by ETR. [...]*
- (125) In the last two years [...]*, CAF has not bid with any integrated supplier in Spain, only with ETR. There were in Spain three other projects with ETR acting as the planned supplier of the electrical part. However, these tenders went to the systems producers Alstom and Bombardier.
- (126) Siemens stated that CAF does not have to depend on ETR but has two alternatives which are also independent. These are Kiepe and TEAM/Ingelectric. With TEAM, CAF won the tender in Bilbao in 1999 for a total of nine trams ("EuskoTran").⁶⁹ This order for the Spanish firm TEAM, a subsidiary of Ingelectric, six years ago has, however, so far been the only one for TEAM, which has no other references. In addition to this, factors other than purely economic ones could have been decisive as TEAM is a Basque company which was given the order for the tram in its own town.
- (127) Kiepe has not so far been successful on the Spanish market. However, it has attempted, in particular through approaches to CAF, to gain a foothold on the Spanish market. Furthermore, its parent company, Vossloh, has since 2005 had a production facility in Valencia which manufactures primarily diesel locomotives, but it also has a tram in its programme. Although this is being equipped, for the orders already obtained, with electrical traction provided by the previous owner of the factory, Alstom, it is certainly not improbable that Kiepe will supply the traction for future orders for this tram. Kiepe must therefore be regarded as a credible alternative to ETR.

⁶⁹ Table 2, Orders for electrical equipment, municipal transport 11-12/04, p. 18.

- (128) The proposed merger would therefore do nothing to alter the situation on the Spanish market, with at least four credible suppliers of trams continuing to be available.
- (129) In **Austria** ETR is, together with Siemens, a consortium partner for the ULF (Ultra Low Floor Tram) and supplies the electrical traction for this vehicle, which has a [60-70]*% share of the tram market. ETR is also a consortium partner with Bombardier for the Cityrunner of the Linz type, which during the same period had a market share of [15-20]*%. The remaining [10-15]*% market share is accounted for by a Cityrunner manufactured by Bombardier and ordered in 1999 by Graz with traction provided by Kiepe.
- (130) Bombardier has already developed a traction system of its own for the Linz Cityrunner, which is now known as the Flexity Outlook, and has used it in orders for the Cityrunner in France, Belgium and Spain. However, in line with the commitment given in the Bombardier/ADtranz case, Bombardier is tied to ETR until April 2006 for further orders of the Cityrunner in Linz. This applies in particular to Linz city transport authority's option on 18 more trams of this type. The aim of the commitment given by Bombardier in the Bombardier/ADtranz case was to maintain an independent supplier for electrical traction systems, including for trams. This commitment would be made obsolete by the takeover of ETR by Siemens and, provided that Siemens, as intended and as currently notified, acquires sole control of VA Tech, will be set aside by a separate Commission decision, conditional on Siemens acquiring, as intended and notified, sole control of VA Tech.⁷⁰ This and the fact that Bombardier is no longer dependent on ETR for this product suggest that there will be no substantial reduction in effective competition on the Austrian market for trams.
- (131) In **Poland** there were four tenders during the relevant period. Bombardier won [...] of the tenders and Alstom and Siemens [...]*. ETR supplied the traction for [...]*. Consequently, following the takeover of ETR, Siemens would be the supplier of [...] of the four successful trams. However, neither Alstom nor Bombardier is dependent on ETR as a supplier of electrical traction since both have their own capacity here. Nor is ETR indispensable as a means of gaining entry to this market. Alstom has taken over the Polish company Konstal and thus has a strong base in Poland since Konstal has manufactured most of the trams in use in Poland. Bombardier has won a further order in Poznan with Kiepe as supplier. In addition to these three established suppliers, Skoda has now in 2005 also won its first order for eight five-section low-floor trams for Wroclaw. It is therefore not to be expected that the takeover of ETR will result in a substantial reduction in effective competition in Poland.
- (132) In the **Czech Republic** ETR is the supplier for Skoda's 03T Astra tram and for Inekon's Trio. Inekon had initially developed the Astra with Skoda, which also built it. The Trio tram is a further development of the Astra and is built by Dopravní Podnik Ostrava (DPO). Siemens has not been able to win any tenders for complete trams. It has, however, taken part in tenders, [...]*. So far, Skoda and Inekon share the Czech market for trams, with Skoda being the clear market leader, while Inekon has so far won orders for only four trams. Skoda has its own traction systems for trams, as with the "Vectra" tram for Cagliari in Italy, and is not dependent on ETR.

⁷⁰ See Commission Decision in Case COMP/M.2139 Bombardier/ADtranz of [...] July 2005.

If, following the takeover of ETR, Siemens were to increase prices or refuse to supply its products, Skoda could switch over to own manufacture. Both Skoda and Inekon would also be able to order the electrical traction from Kiepe as an independent supplier. Alstom, Bombardier and Siemens are also available as potential suppliers of both traction and complete vehicles.

- (133) Accordingly, the takeover of ETR by Siemens does not result in any significant impediment to competition on the market for trams in Austria, Spain, Poland and the Czech Republic.

(b) Underground trains

- (134) The combined market share of Siemens and ETR in the case of **electrical traction** in the EEA was, according to data provided by Siemens, [15-20]*% in the period 1999-2003 (Siemens [15-20]*%, ETR [2-5]*%). The market leader is Bombardier with [40-50]*%, ahead of Alstom with [15-20]*%, Ansaldo with [15-20]*% and Skoda with under [5-10]*%. The market share attributed to Ansaldo relates to orders for which the traction of existing vehicles was replaced. The market investigation confirmed the market leadership of Bombardier and a combined market share for Siemens and ETR of this order of magnitude. ETR's small market share and the relatively small joint market share do not allow the conclusion to be drawn that the proposed takeover would result in a significant impediment to effective competition on the market for electrical traction for underground trains.
- (135) Tenders for underground trains are much less frequent than those for trams and regional trains. In the period under review (1999-2003), there were only 14 projects in the whole of the EEA, and ETR was able to win orders in Austria and Belgium. [...]*. Therefore, the takeover changes nothing in the existing competitive relationships in Austria.
- (136) In **Belgium** ETR supplies the electrical traction systems to CAF, which has won this tender. [...]* As the other two possible suppliers for this project, Bombardier and Alstom, had offered to supply their own train,⁷¹ the number of suppliers for the electrical traction systems in this project would have fallen from two to only one, the merged company Siemens/ETR.
- (137) Even after the planned takeover of ETR by Siemens, a further independent supplier of electrical traction would remain in the EEA. Since 2003 the Japanese company Mitsubishi Electric has been operating in the EEA. To date, it has been able to win two projects as a subcontractor in Europe, both underground train projects. It is the supplier of the metro in Athens, the mechanical part of which is built by the Korean firm Rotem, which also operates as a full-line manufacturer. The second project is the Barcelona metro, for which CAF is responsible. Since 1999 CAF has won contracts once with ETR (Brussels) and once with Mitsubishi (Barcelona) as suppliers and has bid and lost with both of them almost as frequently in other tenders in the EEA. This shows that Mitsubishi is a credible supplier of underground train traction systems.

⁷¹ Doc. 6501 of 6 April 2005, letter from Siemens, p. 3.

(138) Both in Belgium and in Austria there is only a single metro. Tenders are therefore correspondingly rare so that the winner has a monopoly until the next tender. Even after the planned takeover of ETR by Siemens, there would have been one more supplier for the electrical part of the tender for the Belgian metro. In addition, since 2003 there has been another independent supplier of electrical traction for underground trains active in the EEA in the form of Mitsubishi, which already supplies the traction for two projects. Furthermore, in the review period, CAF also won orders with systems producers, including the tenders for underground carriages in Madrid, Barcelona and Rome. For these reasons, the planned takeover of ETR by Siemens does not result in a significant impediment to effective competition in the Belgian market for underground trains.

(c) Regional trains

(139) For regional trains Siemens was not able to submit any separate market shares for the electrical part, on the grounds that the mechanics and the electrics are awarded separately on very rare occasions. ETR is the only credible independent supplier of electrical traction in the EEA which can also supply the electrical part for regional trains and has done so. Kiepe does not have traction for regional trains in its programme, and outside Japan Mitsubishi has no references for regional trains.

(140) ETR is at present an electrical system integrator for only on tried-and-tested and available regional trains. Together with Bombardier, it forms the consortium manufacturing Talent, a regional train, which is available with diesel traction, diesel-electrical traction or simply with electrical traction. It is responsible for the electrical traction system, which, in the case of the electrical ("EMU" and diesel-electrical ("DE-DMU") Talent, accounts for [...]%% and more of the value, and owns patent and protective rights for this traction system.

(141) ETR is also in a consortium with Talgo for the double-decker regional train Talgo 22, which is the first double-decker train to provide inter-car gangways on both levels. The concept of the vehicle is based on a combination of wheel set and articulated train technology from the Talgo XXI and the experiences of Talgo Oy (Finland) in building double-decker vehicles. The Talgo 22 is a new development which is not yet in use. It will become available in the course of 2005 both as an electrical multiple-unit train with traction by ETR and as a simple train set with or without multiple-unit control cars.

(142) According to ETR, EMU and DE-DMU Talents were sold during the relevant period only in Germany, Austria and Norway. In Norway, according to Siemens, there was no overlap as Siemens has sold neither electrical traction systems nor regional trains there. In 2000 Bombardier/ETR won an order for a very small number of electrically driven trains which do not lead to any significant market shares.

(143) In **Germany** Siemens has, according to its own data, a market share of [15-20]%% in the market for regional trains, behind the market leader Bombardier with [50-60]%% and Alstom with [20-30]%% and ahead of Stadler with [5-10]%%. In a separate market for electrical and diesel-electric regional motor-trains, it would, according to its own data, have a [10-15]%% market share and Bombardier a [60-70]%% market share, followed by Alstom with [20-30]%% and Stadler with [5-10]%%. According to Siemens, the Talent's share is [40-50]%%, with [...] trains sold. These figures were essentially confirmed by the market investigation. Since ETR supplies the electrical

traction for the Talent, there would be a vertical link between Siemens and Bombardier, which together supply [50-60]*% of the German market for electrical regional trains (EMUs and DE-EMUs). However, the demand side is equally strongly concentrated. The four hitherto successful suppliers in the German market, all of which have production facilities in the German market, are matched by Deutsche Bahn and a number of smaller regional railways. At least Deutsche Bahn, which accounted for the bulk of the orders during the relevant period, enjoys buyer power.

- (144) In **Austria** [...] Bombardier won orders from the ÖBB for EMUs, namely for its EMU Talent, in the relevant period. [...] By contrast, during the relevant period, Siemens won the [...] for regional diesel traction trains, which means that in the overall market for regional trains in Austria Siemens had a [15-20]*% share and Bombardier an [80-90]*% share. With its product Desiro, which like the Talent is available both as a DMU and with diesel electric or electric traction, Siemens is a close competitor of Bombardier on the Austrian market for electrically driven regional trains. Bombardier and Siemens are the only two suppliers to have their own production facilities in Austria. On the demand side, there was during the relevant period only one customer, the ÖBB, which enjoys market power as a monopsonist. On the other hand, in 2004 the Swiss company Stadler won an order for six of its electrical GTWs. Even though this involved the exercise of an option by the Linz local railway company, this order shows that Stadler too, with its GTW, which like the Desiro and the Talent exists as an EMU and as a DMU, must be seen as a credible supplier on the Austrian market for regional trains.
- (145) Siemens estimates that Bombardier requires approximately [...] to replace ETR as a supplier.⁷² This estimate was broadly confirmed by Bombardier. The latter has already developed its own electrical traction system. Since, however, ETR has industrial property rights to its own components, in particular the control and guidance system of its traction, it would be impossible for Bombardier to provide a number of important functions of ETR's traction, e.g. multiple traction with the Talent trains already delivered and fitted out by ETR. This would be a serious disadvantage for Bombardier when supplying customers who already have the Talent in their fleet. For these functions Bombardier would have to rely on ETR, which after the merger would belong to its direct competitor Siemens. In addition, Siemens would gain access to the technical knowledge of a direct competitor.
- (146) A link between Bombardier and Siemens would reduce competition between the two companies in tenders in Germany and Austria. Siemens would be in a position to dispense with price concessions in the discussions following the tenders and, instead of this, to earn profit as a supplier of the electrical traction, which constitutes up to [...] of the value of a regional train.
- (147) However, Siemens has concluded a contract with Bombardier that enables Bombardier to [...] and to supply the Talent as a wholly independent competitor. This means that the number of independent suppliers of EMU regional trains remains unchanged. Consequently, the planned takeover of ETR by Siemens would not result in a significant impediment to effective competition in the German and Austrian markets for regional trains or in the market for electrical regional trains.

⁷² [...]*.

(d) E-locomotives

- (148) ETR also supplies electrical traction for e-locomotives. Siemens is a manufacturer of electrical locomotives. The takeover of ETR would mean the removal of an independent manufacturer of electrical traction for locomotives from the market. However, ETR did not have any success in tenders in the last [...] years. Furthermore, there is still at least one other manufacturer of traction for electrical locomotives in the EEA. The Spanish supplier Team/Ingelectric is the supplier of the traction for the 44 variable-gauge electrical locomotives which have been ordered by Renfe from the manufacturer Talgo and the prototype of which was presented in December 2004. It is therefore not to be expected that the proposed takeover of ETR by Siemens would result in a significant impediment to effective competition.

(e) Changed market situation due to the removal of ETR

- (149) Siemens claims that there will be no decisive change in the structure of the market due to the takeover of ETR. Already [...] of ETR's order book was taken up with orders from Siemens. The [...] set of orders resulted from projects with Bombardier, which could also manufacture electrical traction systems itself. According to data from Siemens, on average in the four years from 2001 to 2004 [50-60]% of orders came from Siemens, [30-40]% from Bombardier and [5-10]% from CAF. This order of magnitude for the figures was confirmed by VA Tech. However, these figures refer to the past. The proportion of orders carried out with CAF grew significantly only as from 2004 and, according to targets, should rise further. Nor has the Talgo 22 project yet been taken into account in these figures, although preliminary work on it has been carried out and orders are expected as from 2006.
- (150) These figures show that ETR is an increasingly important partner for the two non-integrated manufacturers of rail vehicles, which have no competence in the electrical part. Furthermore, for certain markets and products ETR is also an important partner for systems producers, in particular for Bombardier and the Talent.
- (151) However, Siemens takes the view that the removal of ETR would not pose any competition problems since, on the one hand, there are sufficient alternatives to ETR for the supply of electrical traction and on the other, even if the worst came to the worst and the non-integrated suppliers of electrical rail vehicles were removed, there would still be sufficient competition.
- (152) Whereas trams and underground trains each still have an independent supplier of electrical traction with up-to-date references, it is questionable whether the same situation applies in the case of regional trains. Siemens argues here that there are still independent Japanese electrical manufacturers for regional trains and that there are two new market participants in the shape of ABB and Medcom. The market investigation has, however, shown that hitherto ABB has supplied only essential components, in particular the frequency converter, but not the entire package. Therefore, from the point of view of those customers who cannot undertake integration of the electrical components, ABB is not an alternative to ETR.
- (153) Siemens also refers to the company Medcom in Poland, which has won a first order supplying the electrical traction of a commuter train of the Polish company PESA. Commuter trains are the simplest trains in the regional train sector with a

configuration for speeds of normally not more than 80-120 km/h. This order is so far the only reference for Medcom. yet references are enormously important in this business.⁷³ It is therefore highly questionable whether in the next two to three years Medcom will become a credible supplier outside Poland.

- (154) In addition, Siemens argues, the Japanese suppliers Toshiba and Hitachi are active on the European market. So far Toshiba has only been able to obtain orders in Ireland in which it acted as a subcontractor to another Japanese company Tokyu Car. The last of these orders already dates back three years. The general assessment of the Asian suppliers, therefore, is that they are more likely to become serious competitors in the longer term.⁷⁴
- (155) To date, Hitachi has been able to win one tender. It was selected in October 2004 as the preferred supplier for 30 trains for the “Channel Tunnel Rail Link” project.⁷⁵ However, it is not an independent supplier of electrical traction systems, but an integrated supplier of rail vehicles.
- (156) The proposed takeover therefore reduces the number of independent suppliers for electrical traction on the European markets for regional trains from one to zero. There would then no longer be a credible alternative to the systems producers. Siemens is, however, of the opinion that the non-integrated suppliers are in no way reliant on independent suppliers of electrical traction. The integrated suppliers of rail vehicles often supplied the electrical part separately to non-integrated suppliers. Siemens refers here in particular to the cooperation with CAF in Spain on the regional train Civia, for which Siemens is supplying the electrical traction system.
- (157) This is therefore a rational decision if the customer as a non-integrated supplier of rail vehicles has the option of buying in the electrical traction system from an independent supplier and can therefore in any case make a bid. If, however, this option no longer existed as a result of the proposed takeover of ETR by Siemens, the incentive for the integrated suppliers to make a bid for a total package for the electrical part would change. Bombardier has already made it clear that it follows the strategy, in tenders, of first offering its own complete rail vehicle.⁷⁶
- (158) [...] Bombardier also said that it always offers its own complete product first, before offering the traction to a competitor. Hence, in the case of regional trains, the two independent manufacturers CAF and Talgo would be competing with the integrated systems producers in all those tenders in which they first want to supply their own product.
- (159) But even in cases in which an integrated supplier is prepared in a given tender, at the same time as making a bid for the complete train, to pass on the electrical part to a non-integrated supplier, the non-integrated supplier will be at a competitive disadvantage. In order to match the mechanical and electrical parts with each other, an exchange of technical information is necessary which will give the integrated supplier useful information about the strength of its competitor. Furthermore, the

⁷³ Bearing Point expert report, 44.

⁷⁴ Bearing Point expert report, 46.

⁷⁵ http://www.hitachi-rail.com/rail_now/hot_topics/hot_topics_2004/ctrl.html.

⁷⁶ Doc. 5157 of 15 March 2005, Bombardier, reply to question 3.

integrated supplier will also have control of a block of costs which, on delivery of the overall electrical part, can account for up to [...] % of the total train. This leads to a considerable lessening of competition. The integrated supplier is therefore able to make the non-integrated supplier's bid more expensive or make a less price-aggressive bid with his own product.

- (160) On the other hand, the systems producers do not participate in each and every tender. Almost all of them pursue what is known as a platform strategy, under which a platform such as [...] is adapted to suit the customer's special requirements. Particularly in the case of trams and underground trains, with their special bend curvatures, tunnel dimensions, slope gradients, etc., the car boxes and configurations of these standard products are often unsuitable. It is often not worthwhile adapting them to meet the requirements. [...] Consequently, although non-integrated manufacturers of rail vehicles cannot rely in each tender on receiving a competitive offer from a systems producer for the electrical part, systems producers are, in a not inconsiderable number of tenders, unable to supply a suitable product and then have a very strong incentive to participate at least in the supply of the electrical traction. For example, this is true for the Talgo 22, the only regional train so far with two stepless decks running through the entire train, a product which none of the integrated suppliers can offer.
- (161) On the other hand, the market investigation showed that it is possible to acquire the capacity to plan and integrate an electrical traction system within two or three years. The necessary know-how is relatively easy to acquire. The example of the Swiss company Stadler demonstrated that it was possible, in the three years since the complete takeover of all rights to the GTW regional train and to the Variotram following the Bombardier/ADtranz merger, to develop this integration skill and to assemble the electrical traction from electrical components from, among others, ABB. In view of the long lead times in the rail industry between the issuing of a tender, the picking of the winner and the delivery of the train, two to three years for acquiring the competence for electrical traction do not seem overly long a time.
- (162) Even if the non-integrated suppliers of rail vehicles, including the main non-integrated supplier CAF, were eliminated from the market for electrical rail vehicles, there would continue to be in the individual Member States a sufficiently large number of actual and potential competitors in the overall train market. It must also be borne in mind that, at least in the case of regional trains, the demand side enjoys market power.

(f) Conclusion

- (163) The planned takeover of ETR by Siemens reduces the number of credible independent suppliers on the two markets for tram and underground train traction and for electrical traction for locomotives from two to one and eliminates the last independent credible supplier for electrical traction for regional trains. However, for several reasons, this will not result in the existing effective competition for electrical traction for tram and underground train vehicles, regional trains and locomotives being significantly impeded.
- (164) First, a credible independent supplier will still remain in each of the two markets for tram and underground train traction and for electrical traction for locomotives. Second, the systems producers will also continue to be suppliers for all traction

systems. Third, there is the real possibility of acquiring within two to three years the ability to integrate the electrical part. Lastly, even in the hypothetical event of a successful strategy designed to squeeze non-integrated suppliers of electrical rail vehicles from the market, sufficient competition would remain in the relevant downstream market for rail vehicles.

C2. CONTACT LINE ENGINEERING

1. Relevant product markets

- (165) Railway contact lines are transmission systems for supplying trains with electric current via current collectors. In most cases the current is supplied by overhead lines suspended above the locomotives. In the case of underground railways and to some extent overhead railways as well, it is supplied by a live third rail.
- (166) Siemens considers that, as in the ABB/DaimlerBenz decision, there is a uniform market for contact lines, which cannot be subdivided by final consumer, e.g. suburban or long-distance railways, or by system (overhead contact line versus third rail). Some customers submitted, however, that it is correct to differentiate first between third rail and overhead contact lines and then to subdivide overhead lines between local/urban traffic and mainline traffic. This question can be left open in the present case, however, since even on a narrow definition – overhead contact lines for mainline traffic in this case - effective competition will not be significantly impeded.

2. Relevant geographic markets

- (167) The proposed takeover of VA Tech leads to overlaps in Germany only. In its ABB/DaimlerBenz Decision the Commission assumed that the markets for contact systems were national.⁷⁷ Siemens considers that they have since grown to become more like the EEA market. The market investigation revealed a very uneven picture, in particular among German urban transport companies, ranging from national to worldwide markets. Since dc networks and similar voltages in the 600-750 kV range are usually used for tramways and underground railways throughout the EEA, the market for contact lines in an urban context is more homogeneous than for contact lines in long-distance transport. It is therefore simpler, at least theoretically, to commission foreign suppliers. None of the urban transport companies surveyed, however, has commissioned a supplier of contact lines that does not have its own branch in Germany. In the case of current supply lines, VA Tech serviced the first projects on the German market from Austria, but very soon with its own branch set up a support centre in Germany. Given present demand behaviour in Germany, however, an EEA-wide definition does not seem appropriate. For the purposes of this Decision, therefore, national markets continue to be assumed.

3. Competition assessment

- (168) The proposed takeover of VA Tech leads to overlaps in Germany only, since Siemens has transferred its Austrian business to SPL under a management buy-out. According to Siemens, the parties' joint share of the German market for all contact

⁷⁷ See IV/M.580 ABB/Daimler Benz, Commission Decision of 18.10.1995; IV/M.1064, paragraphs 30 and 41.

line engineering in 1999-2003 is [40-50]*% (Siemens [30-40]*%, VA Tech [2-5]*%). The market survey confirmed that the joint market share is of this order of magnitude (Siemens [30-40]*%, VA Tech [0-5]*%). The competitor Balfour Beatty is roughly as strong, so that the two largest suppliers together have a share of [70-80]*%. The other suppliers such as Bahnbau, Elpro, Fahrleitungsbau (RWE), Spitzke and Amec Spie have a market share of in some cases significantly less than 10%.

- (169) At just under [2-5]*%, VA Tech's market share in Germany is relatively small. VA Tech is one of the altogether five smaller suppliers in the German market. The merger will not result therefore in a considerable change in market structure. Moreover, only in overhead contact lines for mainline transport are there any overlaps. Even if overhead contact lines for mainline transport were defined as a separate product market, competition would not be appreciably reduced. Siemens and VA Tech would then have a joint market share of under [30-40]*%: the market leader in this segment would be Balfour Beatty. Even if VA Tech is somewhat stronger in this market than in the overall market, it is nevertheless one of five smaller suppliers which each have a market share of clearly less than 10%. At the same time, Deutsche Bahn is the only customer in that market and has buyer power.
- (170) Deutsche Bahn has submitted that after a takeover of VA Tech by Siemens, in the market segment for large contact line projects in mainline transport with a volume of over EUR 10 million there would only be two suppliers left: Siemens/VA Tech and Balfour Beatty. In DB Bahnbau GmbH, however, Deutsche Bahn has its own subsidiary in the contact lines sector, which is managed like an independent firm.⁷⁸ In the period under consideration this had a [5-10%]* share of Deutsche Bahn's orders. In the past, Bahnbau has won individual projects with a volume of over EUR 5 million and framework agreements worth over EUR 10 million. It must therefore be assumed that it is able to submit a credible bid for individual contracts in excess of EUR 10 million.
- (171) Analysis of the tenders in the period 1999-2004 also supports the conclusion that the market structure has not been substantially changed. Siemens and VA Tech were both involved in only [...] of the total 5 749 Deutsche Bahn tenders, i.e. in a little more than [...] percent. In [...] cases the two firms were first or second and hence the closest competitors for the particular project. These [...] orders account for [2-5]*% of the total volume of orders in the period under consideration.
- (172) If one considers only tenders for projects in excess of EUR 10 million, the picture is as follows: of the [...] orders in question, [...] went to Siemens, [...] to Balfour Beatty and [...] to VA Tech, Spitzke and DB's own subsidiary Bahnbau. The latter, however, was a framework contract covering several smaller projects. [...]*, it cannot be inferred from this that competition in the German market for contact line engineering will be substantially reduced by the takeover.
- (173) Moreover, the breakdown of orders shows that Spitzke, as well as Siemens and Balfour Beatty, is able to handle large orders of this kind. Thus Deutsche Bahn has three suppliers in this market segment. Furthermore, during the period in question, Elpro was able to win an order in the EUR 5 million category. While this order was

⁷⁸ DB Netz AG, Annual Report 2003, p. 28.

six years ago, it shows that, potentially at least, Elpro is capable of submitting a credible bid for tenders worth over EUR 5 million, especially if prices should rise as a result of the merger. In addition, DB's own subsidiary Bahnbau can be used at any time as a corrective. As a further possibility, the smaller competitors could form a consortium for large orders in excess of EUR 10 million.

- (174) Nor does the takeover of VA Tech increase the risk of tacit coordination by a duopoly of Siemens and Balfour Beatty in the German market. In the market for the construction of contact lines for mainline transport, prices and margins have been falling for some years, as the only customer, Deutsche Bahn, is reducing investment, in particular because of the decline in Federal funds for railway infrastructure until 2008. For this reason, Siemens had intended to sell this sector to Leonhard Weiss.⁷⁹ Another supplier was also supposed to be sold. Tacit coordination in a market with shrinking volumes and margins is difficult, however, since every rational supplier has an incentive to circumvent that coordination and secure for itself today a larger share of the profit from the sector, which will already be smaller tomorrow. Nor, given the tender data, is the argument convincing that, as a relatively new supplier in the German market, VA Tech acts as a corrective or "maverick" which can successfully disrupt the tacit coordination between Siemens and Balfour Beatty.
- (175) In view of the above, the Commission finds that the proposed takeover will not lead to a significant impediment to effective competition either in the German overall market for contact lines or in a possibly narrower German market for overhead contact lines for mainline traffic.

C3. TRACTION POWER SUPPLY

1. Relevant product markets

- (176) The market for supplying power to electric railway vehicles can basically be divided into three segments: the generation of electricity in power stations and substations for frequency conversion, the traction current cables and the power supply points in the traction network.
- (177) These can be further subdivided according to the type of railway. While tramways, underground railways and most regional railways operate on direct current with a voltage of 600 V, 750 V or 3 kV, intercity railways use alternating current at a substantially higher voltage of 15 kV or over. The operators of traction current networks for long-distance traffic, such as Deutsche Bahn or ÖBB, often have their own power stations or at least their own generators in national grid power stations, while regional and urban railways generally draw their power supplies from the networks of the publicly-owned energy supply companies EVU.
- (178) Generation and transmission via overland cables to the traction current network are not usually specific to the railway field. This does not apply, however, to the five countries Germany, Switzerland, Austria, Norway and Sweden. These have their own traction current networks, which are operated with single-pole alternating current at a frequency of 16 2/3 Hz and 15 kV voltage. This traction current cannot be procured direct from the energy suppliers' distribution networks, but is generated

⁷⁹ Frankfurter Allgemeine Zeitung No 47, 25.2.2005, p. 20. The sale failed for collective bargaining reasons.

partly in the railways' own power stations and partly in ordinary power stations by generators and inverters specifically installed for the purpose and, in Germany's case, transmitted via 110 kV lines to the traction current network.

- (179) From the demand angle it is not possible to replace plant for generating 16 2/3 Hz/15 kV traction current with turbines on account of the special voltage and frequency. However, the producers of power stations and generators are also able, without exception, to make plant for the special requirements of railways that use 16 2/3 Hz/15 kV traction current. Given this flexibility on the part of suppliers, it is therefore not appropriate to assume an independent market for the generation of 16 2/3 Hz/15 kV traction current. Moreover, traction current can be generated not only with turbines but also with static inverters on the basis of semiconductor components. This technology will become increasingly important compared with conventional generation using turbines.⁸⁰
- (180) The situation is otherwise with regard to the servicing of such plants, which often run for decades. With repairs and maintenance, the firm which produced the plant is at an advantage here, since it has the working drawings and the appropriate experience.
- (181) As regards the installation of the overhead lines, which transmit the traction current from the power station to the power supply points, there is no overlapping in the present case, since Siemens has sold this business, which now operates as an independent company under the name FBG Freileitungsbau.
- (182) The supply of traction current proper, i.e. the supply of electricity to the traction current network, is ensured by power supply points, also known as substations, transformer stations or switchgear. By means of these substations the electricity from the energy suppliers' distribution networks is converted to the voltage required by the particular railway and fed into the traction current network. Substations consist basically of high and medium voltage switchgear, transformers, inverters and rectifiers, station control engineering and the necessary auxiliary equipment.
- (183) In accordance with the ABB/DaimlerBenz decision, Siemens considers that in the case of traction power supply, a sector where Siemens and VA Tech operate *inter alia* through their subsidiary SAT, the market is uniform and cannot be further subdivided. The market survey confirmed that all major suppliers of traction power supply equipment offer complete installations, even if they do not manufacture individual components themselves and hence buy them additionally or have them provided by the customer.
- (184) A fairly large number of customers and some competitors consider, however, that separate markets should be defined for these components, in particular for control engineering. Some customers also procure only individual components or do not award a substation to a general contractor, but hold a separate tender. One competitor submitted in this respect that a merged Siemens/VA Tech would have some key components that would in practice give it a monopoly for certain segments of traction power supply for mainline traffic. However, even if, as suggested by Deutsche Bahn, one were to make a further division between switchgear with

⁸⁰ Doc. 4750 Deutsche Bahn, 11.3.05, reply to question 8.

network control, remote control and safety engineering on the one hand and components for those systems on the other,⁸¹ the proposed merger would not lead to a significant impediment to effective competition.

- (185) To sum up, therefore, the following product markets are differentiated in the traction power supply sector: complete substations, railway specific components for substations and servicing turbines for generating traction current.

2. Relevant geographic markets

- (186) In its ABB/DaimlerBenz decision the Commission assumed that the markets for the supply of traction current proper were national. Siemens considers that they have since grown to become more like the EEA market. The market investigation revealed a very mixed picture. Although a majority regarded national markets as too narrow and sees the EEA as the relevant geographic market, not a few customers assume national markets. None of the urban transport companies surveyed, however, has commissioned a supplier of substations or components that does not have its own branch in Germany or Austria. In addition, all safety-relevant components of traction power supply must be accepted by a national authority. Given present demand behaviour in Germany and Austria, therefore, an EEA-wide definition does not seem appropriate. For the purposes of this Decision, therefore, national markets continue to be assumed. The same applies to the servicing of turbines for generating traction current.

3. Competition assessment

- (187) According to Siemens, Siemens and VA Tech achieved a joint market share of [30-40]*% (Siemens [15-20]*%, VA Tech [20-30]*%) in the Austrian market for complete substations. Other competitors are ABB with [10-15]*% and Areva (ex-Alstom) with [10-15]*%, plus a number of smaller suppliers.
- (188) The market investigation revealed that, averaged over the five years 1999-2003, the Austrian market was worth EUR 10 million. Siemens's market share was [10-15]*%, that of VA Tech [30-40]*%, and the joint market share [40-50]*%. Areva had 20-30%, ABB 10-20%, Balfour Beatty and SAG, a subsidiary of RWE, 5-10%. The remainder is shared among relatively small suppliers, such as Sprecher Automation.
- (189) Because there are few projects, the market shares fluctuate very considerably from year to year. Thus, in the period under review, Siemens' market share was between [2-5]*% and [30-40]*%. In 2004 ABB won a large order for renewal of the traction power supply (substations) for Wiener Linien's U1 and U2 lines, worth over EUR 10 million; this makes ABB the outright market leader for 2004. On the supplier side, as well as the three established internationally active competitors of Siemens and VA Tech - ABB, Areva and Balfour Beatty - there is also a relatively small supplier that can offer complete substations. In 2002 Sprecher Automation took over Alstom Austria's former control technology business and is thus able to position itself in the market as a complete supplier of substations.
- (190) On the demand side in Austria there are basically only two customers which have buyer power: Österreichische Bundesbahnen and Wiener Linien. Both these

⁸¹ Doc. 1047 Deutsche Bahn, 24.1.2005, reply to question B6.

customers put their orders out to tender. Since these are tender markets and only very few substations are put out to tender every year, effective competition prevails, as the range of the market shares shows.

- (191) In the case of components, by taking over VA Tech's subsidiary SAT, Siemens acquires one of the three station control technology systems approved by ÖBB. The two other approved systems are produced by ABB and Sprecher. Even if Siemens, after taking over VA Tech, no longer markets the SAT product to third parties, the sole customer for this system, ÖBB, would still have at least three suppliers of complete substations, which use their own station control system approved by ÖBB. Added to this, ÖBB is quite at liberty to approve further suppliers of such systems if necessary.
- (192) Siemens's and VA Tech's joint share of the German market for complete substations is [40-50]*% (Siemens [30-40]*%, VA Tech [5-10]*%). The most important competitors are Balfour Beatty with 20-30%, ABB with 10-20%, Elpro with 10-20% and Spitzke with 5-10%.
- (193) VA Tech, through its subsidiary SAT, is largely active in the mainline sector, i.e. supplying Deutsche Bahn with traction power (alternating current of the 16 2/3 Hz and 15 kV variety) and only to an insignificant extent in the mass transit segment, i.e. the direct current segment. In the mass transit segment, none of the market participants surveyed, in particular all the approximately 20 customers, saw the proposed merger as raising competition concerns.
- (194) In the mainline traction power segment, where Siemens and VA Tech have a joint market share of some [20-30]*%, one competitor and in particular the main customer, Deutsche Bahn, considered that SAT should not be taken over by Siemens, since otherwise in the case of some major components while there would be no horizontal overlapping there would be a problem of market foreclosure.⁸² SAT offers in particular station control technology, remote technology, network control systems (SCADA) and associated automation components.
- (195) Some traction power supply engineering components and remote technology and network control systems products, such as SCADA and Remote Terminal Units, are standard products from the T&D sector (see above, T&D paragraphs XY), which are adapted to the requirements of the railway networks. As well as the large manufacturers there are also smaller competitors, which have specialised in the rail segment with its 16 2/3 Hz/15 kV network, such as Kayser-Threde, a leading supplier of control technology for monitoring and regulating substations. Other products are so specific to the railways that they require a special licence from the German Federal Railways Office (EBA). In the case of three components for traction power supply proper, SAT is one of the few manufacturers, or even the only one, which has already received, or has good prospects of receiving, the necessary licence. SAT supplies a local control device (LCD), a product which is used in remote technology. As well as SAT, however, AEG ursatronics and ABB are also present in the market. Siemens has no LCD of its own which is licensed by the EBA.

⁸² Doc. 1047, 24.1.2005, Deutsche Bahn's reply to a request for information, questions 21 and 23.

- (196) Under the Federal Railways Office's directive on improving tunnel safety, tunnels in Germany must be provided *inter alia* with a contact line voltage tester (CLVT). SAT was hitherto the only CLVT supplier licensed by the EBA. Balfour Beatty too has recently brought out an EBA-approved system, which is based on the SAT system. [...]*
- (197) The third product concerns junction-related tests (JRTs). This product was developed for the protection design of Deutsche Bahn's contact line installations. It is not yet in use, but will soon be tested and then presented to the EBA for final approval. SAT would then be the sole supplier of such a novel testing system for Deutsche Bahn's contact lines. However, Deutsche Bahn already has an automated system for testing contact lines when switching on a route section (ASTCL). Compared with the ASTCL the JRT testing system is an innovation, since test resistance including the test cell disappear and the product is therefore lighter and smaller.
- (198) Siemens does not have any of these three products. Consequently, the number of suppliers present in the market is not altered by Siemens's takeover of SAT. Market foreclosure by Siemens is also improbable. Thus, as before, there are three LCD products, but only one customer. With CLVTs in the past Deutsche Bahn has either provided the general contractor with the product or prescribed it. It is not yet possible to tell whether JRT will supersede the ASTCL. Deutsche Bahn has admitted, however, that innovations in this area can possibly also be generated by other suppliers. It should not be expected, therefore, that the takeover of the VA Tech subsidiary SAT will appreciably restrict effective competition in components for traction power supply.
- (199) Both Siemens and VA Tech supply the service of maintaining turbines for generating 16 2/3 Hz traction current. Deutsche Bahn has suggested that, as a result of Siemens's takeover of VA Tech, competition in the market for the high-tech maintenance of such turbines in Germany would be lost on account in particular of the bundling of working drawings and available experience. VA Tech, however, has built only one plant for Deutsche Bahn. The plant, which was built in 1998, was the last of its type, since new plants are only being built on the basis of static inverters. Static inverters are supplied by Areva, ABB and Siemens, but not VA Tech.
- (200) Apart from by Siemens, such plants, of which there are about 20 in Germany, have been built by BBC in particular. This business was taken over by Alstom, which continues to supply in this market. There are also firms which, while they do not have the engineering plans, have many years' experience of maintaining and adapting such plants. These include in particular the RWE subsidiary SGB. It should not be expected therefore that the takeover of VA Tech, which has built only one plant, will lead to a significant reduction of effective competition in maintenance.

C4. LEVEL CROSSINGS

- (201) Both Siemens and VA Tech supply level crossings. VA Tech operates only in Austria. VA Tech does not have its own product but markets exclusively the BUES 2000 computer-controlled level crossing safety technology of the German manufacturer Scheidt & Bachmann. BUES 2000 is basically an electronic control system and is delivered by VA Tech to Zelisko, a subsidiary of Knorr Bremse, which incorporates it in its level crossings and also supplies it in Austria. VA Tech holds

the operating licences for BUES 2000, which are issued by the Austrian Ministry of Transport. Given these legal barriers to entry, national markets are probably appropriate. Siemens has no sales at all in Austria and is therefore only a potential competitor.

- (202) One market participant feared that, after the takeover of VA Tech, Siemens would only supply its own level crossings in Austria. The market surveys have shown, however, that there are no major legal obstacles to transferring the licence to Scheidt & Bachmann, which recently set up a subsidiary in Austria. Scheidt & Bachmann is quite able, therefore, to assume the further marketing of BUES 2000 in Austria.⁸³ The number of competitors in the Austrian market for level crossings would not therefore be altered by the takeover of VA Tech. Thus the merger would not significantly impede basic competition in the market for level crossings in Austria.

D. FREQUENCY INVERTERS

1. Relevant product markets

- (203) Frequency inverters are part of an electric drive. The drive consists of a motor and a switchgear. A frequency inverter is a switchgear which regulates the speed of the motor. To this end the usual ac network frequency of 50 hertz is converted into a higher or lower frequency.
- (204) Siemens proposes that the market be divided into simple inverters up to and including 100 kW and heavy-duty inverters of over 100 kW. Inverters up to and including 100 kW are a mass market, while inverters over 100 kW are usually high-tech products tailored to the customer's needs. Frequency inverters with an output of up to 100 000 kW are supplied. Such inverters are used in heavy machine construction and industrial plants, in particular in energy-intensive sectors, such as rolling-mill drives and ships' engines or in the oil and gas industry.
- (205) The market investigation revealed that there is a mass market, served by many firms, some of which operate at regional level only. On the other hand the number of firms which can supply frequency inverters with a high to very high output falls as the output required increases. The overwhelming assessment of the market participants surveyed, however, was that 100 kW was an acceptable ceiling for defining the mass market. For the purposes of this Decision, therefore, a limit is placed at 100 kW.
- (206) Some market participants thought that the market for frequency inverters over 100 kW should be subdivided further. Thus there is a market for water-cooled frequency inverters and for four-quadrant frequency inverters, which can feed current back again into the network. Water-cooled inverters are used in particular in mining and for tunnel-boring machines. In these applications air-cooled drives are not possible, since the heat and penetrating dust would very quickly put the inverter out of action. Four-quadrant inverters are used, for example, in engine test beds.
- (207) Whether a further breakdown by water-cooled inverters and four-quadrant inverters is appropriate can be disregarded for the purposes of this Decision, however, since

⁸³ Doc. 5571, 22.3.05, reply from Scheidt & Bachmann.

the competition assessment would not be any different even if separate markets were assumed.

2. Relevant geographic markets

- (208) Siemens considers that the relevant geographic market is the world, or at least the EEA. VA Tech, too, opts for a worldwide market. According to Siemens there are only two technical standards worldwide. The IEC standard of the International Electrotechnical Commission applies around the world; only in North America is there a variant standard (ANSI). The IEC applies in the EEA, where there are no variant standards. ABB considers that in the EEA there are definitely variant standards in individual countries. Thus, in the UK the *Harmonics Standard* applies, in Norway everything has to be aligned on 110 kV three-phase current, and in France the earthing has to be different.⁸⁴ However, since all major suppliers are in a position to meet these additional requirements, it does not seem appropriate to assume national markets on the basis of these technical provisions.
- (209) Siemens maintains that the prices for frequency inverters in the European Union are similar. This was basically confirmed by the market investigation. Since there are neither technical obstacles nor large price differences and the overwhelming majority of replies to the Commission's market survey assumes at least an EEA-wide market, an EEA-wide market is taken as the basis for this Decision.

3. Competition assessment

- (210) Suppliers in the market for frequency inverters can be divided into three large groups. In the first are the firms operating on a European or worldwide basis, such as ABB, Alstom, Danfoss, Schneider Toshiba and Siemens. In the second group belong firms such as Vacon and Lenze, which are represented in many countries of the EEA but are regional in emphasis. The last group is made up of small firms, which operate in the up-to-100 kW sector in particular and often actively supply in only one member country.
- (211) According to Siemens, the combined market share of the EEA market for frequency inverters ≤ 100 kW in 2003 was [15-20]*% (Siemens [15-20]*%, VA Tech [<2]*%). The market survey broadly confirmed this, as the following table shows:

Inverters ≤ 100 kW EEA		
Competitors	Turnover 2003, € m	Share
Siemens	[...]*	[15-20]*
VA Tech		[0-5]*
Schneider/Toshiba STI		10-15
Total		[30-40]*

⁸⁴ Doc. 4861, ABB, Second questionnaire on inverters, reply to question 13.

ABB		10-20
Alstom		0
Danfoss		10-20
Fuji Electric		0-5
Lenze		5-10
SEW Eurodrive		5-10
Vacon		5-10
Yaskawa/Omron		5-10
Others	0	0
Total	800-900	

(212) The most important competitors are ABB, Danfoss and Schneider with a market share of 10-20% and Lenze, SEW Eurodrive Vacon and Yaskawa/Omron with 5-10%. The market investigation showed, however, that since 2004 VA Tech has been associated with Schneider Electric and Toshiba (Schneider Toshiba Inverter VA Tech, STI VA Tech) in a joint venture, which is planning the joint development and production of inverters both below and above 100 kW. The total market share controlled by Siemens after the proposed merger would be [30-40]*%.

(213) It should be borne in mind, however, that these market share data show the highest possible values, since no value for Others was given in the table. Siemens gives its sales as EUR [...] million, which corresponds to a market share of [20-30]*%. The Commission could not verify this figure. It has established that, apart from a few medium-sized firms operating at local level such as Baumüller, among others US suppliers like Rockwell are selling in the EEA. In any event, therefore, the real market share of Siemens and VA Tech, including STI, is lower than [30-40]*%. Moreover, in this market there are several credible alternatives that operate Europe-wide, such as ABB, Danfoss, SEW and Vacon, which at any time could thwart the attempts of a merged Siemens/VA Tech to raise the prices of its inverters above the competitive price, and a number of smaller manufacturers, which have a strong position locally or nationally.

(214) According to its own figures, after the proposed takeover of VA Tech, Siemens would have [10-15]*% of the market for inverters >100 kW (Siemens [10-15]*%, VA Tech [<2]*%). While the figures for Siemens were confirmed by the market survey, VA Tech's market share is significantly higher, so that the joint market share would be [15-20]*% (Siemens [10-15]*%, VA Tech [5-10]*%). With STI, it would be [20-30]*%. The clear market leader is Alstom with a market share of [30-40]*%, followed by ABB with [20-30]*% and Vacon with [5-10]*%.

Inverters >100 kW EEA		
---------------------------------	--	--

Competitors	Turnover 2003, € m	Share
Siemens	[...]*	[10-15]*
VA Tech		[5-10]*
Schneider/Toshiba STI		0-5
Total		[20-30]*
ABB		20-30
Alstom		30-40
Danfoss		0-5
Loher ⁸⁵		0-5
Lenze		0-5
Vacon		5-10
Others		0
Total	400-500	

(215) Here too it should be borne in mind, however, that this [20-30]*% shows the highest possible value, since no value for Others was given in the table. Siemens gives its sales as EUR [...]* million, which corresponds to a market share of [40-50]*%. The Commission could not verify this figure. It has established that apart from firms such as Bombardier and SEW Eurodrive, which have a very small market share, a number of medium-sized European firms, such as Baumüller and Breuer, and US suppliers like Rockwell and Eaton are selling inverters of over 100 kW in the EEA. In any event, therefore, the real market share of Siemens and VA Tech, including STI, is lower than [20-30]*%.

(216) In the case of water-cooled frequency inverters of over 100 kW, which are used in tunnel-boring machines in particular, Siemens and VA Tech have a joint market share of [5-10]*%. The market leaders in this segment are Alstom with 60-70% and ABB with 20-30%. Other substantial suppliers are Vacon Baumüller and the US firm Eaton with its Cutler-Hammer brand. These figures and the existence of credible alternatives are enough to show that Siemens/VA Tech would not be in a position significantly to impede effective competition. Even in the tunnel-boring

⁸⁵ Loher is a subsidiary of Flender Holding GmbH. In its decision of 30 June 2005 in case COMP/M.3809 Siemens/Flender the Commission has cleared the takeover of Flender by Siemens. Even if Loher is included, the combined market share of Siemens and VA Tech remains 20-25%.

machines segment with its special requirements, the proposed merger does not raise any competition concerns. In this segment there are basically the two German firms, Herrenknecht and Wirth, and the US firm Robbins, which is also present in Europe; together they meet much of the worldwide demand. The market survey showed that these firms use water-cooled inverters from four different manufacturers, but none from Siemens. Thus the proposed merger does not result in any structural change in this market segment.

- (217) In the case of four-quadrant frequency inverters of over 100 kW, Siemens together with VA Tech and STI had a market share in the EEA of [15-20]*% in 2003. The market leader is ABB with 40-50%, followed by Alstom with 20-30%. As well as these large suppliers there are many smaller ones. One cannot conclude from this market share that there are competition concerns.
- (218) Four-quadrant frequency inverters are used *inter alia* for engine test beds. The customers are mainly the large motor vehicle groups but also include universities and research institutes. Siemens is active in this downstream market. According to its own data, the world market leader is the Austrian firm AVL List with, according to Siemens, some [40-50]*% of the EEA market, followed by Siemens with [20-30]*% and Schenck Pegasus with [10-15]*%. Of the two main competitors, only AVL List uses VA Tech inverters on a relatively large scale. However, AVL also has other current suppliers and, with ABB and Alstom, credible potential suppliers (whose products would have to be adapted for test bed purposes) which are not themselves active in the market for engine test beds. In addition, there are suppliers offering inverters specially developed for engine test beds, such as the US firm Unico, which has been present in Europe also for some time.
- (219) For these reasons the Commission considers that the proposed takeover of VA Tech by Siemens does not significantly impede competition in the market for frequency inverters below and above 100 kW.

E. METAL PLANT BUILDING AND OTHER INDUSTRIAL PLANT BUILDING

1. Relevant product markets

(a) Fundamental distinctions

Distinction according to sectors

- (220) In industrial plant building a distinction can be made firstly by sector (metal, chemicals, paper, cement, etc.). Although Siemens and VA Tech are active in several sectors as plant builders, it is particularly important for the purposes of this Decision to take a closer look at metal industrial plant building, since it is in this sector that most of VA Tech's plant building activities are concentrated. In metal plant building there are separate sectors for the manufacture and processing of ferrous and non-ferrous metals. The main non-ferrous metal is aluminium.

Distinction between mechanical plant building, electrical plant building and maintenance and service

- (221) A further fundamental distinction exists between mechanical industrial plant building electric industrial plant building and plant maintenance and servicing.

- (222) Mechanical industrial plant building plans the use of machines for the relevant industrial production process, obtains these machines and installs them in the production plant. Traditionally it includes the area of process technology, but does not include the civil engineering building of the plant (e.g. constructing the building). Through its subsidiary company VAI, VA Tech acts as a supplier of mechanical plant building. Siemens itself is not active in this area as a supplier, but in the metallurgical sector has an important [...] holding⁸⁶ in one of the two keenest competitors of VA Tech, SMS Demag. Through this stake Siemens gains an insight into key aspects of SMS Demag's competitive position. Furthermore, Siemens has its own know-how in metals processing technology.⁸⁷
- (223) Electrical industrial plant building includes firstly the general electrification of the plant ("electrics"), the configuration and assembly of drive solutions, consisting of motors and inverters ("drives") and, if necessary, the configuration and assembly of sensors ("sensors"), and secondly the area of actual automation, which basically consists of electric monitoring and control systems as well as of process automation. In addition there is a third area, which concerns IT solutions for plant logistics. Both Siemens and VA Tech act as suppliers in electrical industrial plant building. VA Tech is active in electrical industrial plant building through its subsidiary VAI (in the metallurgical sector) and Elin EBG (in various sectors).
- (224) Plant maintenance and plant servicing are not to be confused with plant modernisation, which is a part of both electrical and mechanical plant building. Ongoing maintenance work and service provision are part of plant maintenance and plant servicing, but there is no new designing of parts of the plant. Siemens and VA Tech are both active in the metallurgical area in plant maintenance and plant servicing.

Differentiation by process area and process stage

- (225) In the procedurally more complex process industries (such as metals, chemicals, oil and gas), plant building can also be broken down into individual process areas and process stages. In metal plant building, which includes the whole process flow of blast furnace engineering and rolling mill technology, metal production and processing in the iron and steel sector contains the following different stages.
- First of all, metal plant building is divided into process areas. The most important process areas are the blast-furnace area (liquid phase) and the two process areas for the production of flat-rolled products, namely the hot phase and the cold phase. A special area is the rolling of long products.⁸⁸
 - The individual process areas can be subdivided by process stage. The blast-furnace area (also known as the liquid phase process area) is made up of ironmaking and steelmaking process stages. The hot phase process area consists of the continuous casting and hot rolling process stages. The cold phase process area consists of the

⁸⁶ See reply to the request for information of 29 March 2005, Annex 1a, sheet 30.

⁸⁷ See paragraphs (253) and (316).

⁸⁸ Long-rolled products and flat rolled products have the process stages of pig iron making and steelmaking in common, after continuous casting, in which they still display many common features, they are separate. In the production steps after continuous casting, long-rolling (e.g. section rolling) is then clearly separate from the technique for rolling flat products (hot rolling, cold rolling, strip-processing).

cold rolling and strip treatment process stages. The most important process stages in the production of long rolled products are section rolling mills and pipe manufacturing plants. Pressing and forging can be taken as being a separate process stage.

– Fundamental process stages can be broken down further (e.g. into sub-process stages or by type of plant), but these are not relevant to this Decision.

– *(b)Mechanical metal plant building*

(226) Siemens assumes that use of the mechanical part of industrial plants is sector-specific and therefore assumes a separate product market for mechanical metal plant building. However, Siemens does not follow the further subdivision adopted by the Commission in its SMS/Mannesmann Demag decision⁸⁹ corresponding to the process stages⁹⁰, but assumes that these are only segments of a larger market for mechanical metal plant building. Siemens furthermore argues that there is sufficient supplyside substitutability as also smaller competitors could usually offer mechanical plant building services for various process steps.

(227) In the context of the Commission's market surveys, the majority of market participants were in favour of a further subdivision of the market into the respective process stages or groups of related process stages.⁹¹ In VA Tech's view, only a few suppliers, so-called "full-liners", can supply the mechanical plant for all process stages. According to VA Tech these include its own subsidiary VAI and SMS-Demag and Danieli, whereas smaller suppliers specialise in individual technologies and generally do not win any orders above a certain size. VA Tech also states that because of financing problems, such businesses also have no access to consortia of small suppliers. The Commission shares these views.

(228) It can first be stated that the process technologies of the individual production steps vary enormously and there are no substitution options on the demand side.

(229) Beyond that, the market investigation has shown that the supplier structure in the various process steps of mechanical plant building in the iron/steel sector is clearly different. There is a clearly separate supplier structure not only in special areas such as pipe production, moulding and forging, aluminium (rolling) plants⁹² and copper plants but also for the main process stages of producing flat steel products and long steel products a clear differentiation of the supplier structure can be seen. First, smaller suppliers do not offer in all process steps. E.g., some competitors such as Andritz and MINO essentially offer in the process steps of cold rolling and processing lines.⁹³ Other competitors such as Paul Wurth and Küttner only supply in

⁸⁹ IV/M.1450 - SMS/Mannesmann Demag.

⁹⁰ Pig iron making, steelmaking, continuous casting plants, hot rolling mills, cold rolling mills, section rolling mills, strip plants, pipe manufacturing plants, pressing and forging, aluminium rolling mills and copper mills.

⁹¹ Thus the market survey revealed that the large majority of the market participants surveyed regard the continuous casting process stage as a separate market and that aluminium rolling is to be differentiated from steel rolling for the purposes of the product market definition.

⁹² It must be noted that there is a clear specialisation of suppliers in the area of aluminium rolling (e.g. by Achenbach and Fata Hunter).

⁹³ This at the same time indicates that there is insufficient supplyside substitution between hot rolling and cold rolling.

iron- and steelmaking. Second, there is even among the „full-liners“ a clear internal specialisation of different subsidiaries and business units with regard to individual process steps. This is reflected in significant variations in the suppliers' self estimates concerning its ranking per process step.⁹⁴ Third, the market investigation has shown that not only suppliers but also customers differentiate their market view, as expressed in rankings of suppliers, clearly by process step. Not all full liners are seen as equally good alternatives for each process step. Smaller specialists have only been mentioned in specific process steps.⁹⁵ Therefore, there is insufficient supply side substitution between mechanical plant building for the process steps in iron and steel production and processing and in the processing of non-ferrous metals such as aluminium and copper.

- (230) For these reasons the breakdown applied in the SMS/Mannesmann Demag decision⁹⁶ corresponding to the production stages for mechanical industrial plant building can be retained for the purpose of this Decision. Accordingly, a distinction must be drawn between product markets for pig iron making, steelmaking, continuous casting plants, hot rolling mills, cold rolling mills, strip plants, section rolling mills, pipe manufacturing plants and hot pressing and forging. Likewise in accordance with the SMS/Mannesmann Demag decision, a distinction has to be drawn between metal plant building for iron and steel on the one hand and non-ferrous metals, in particular aluminium and copper, on the other.⁹⁷
- (231) Since, for the purposes of this Decision, a division into individual submarkets of mechanical metal plant building (i.e. into the markets for pig iron making, steel making, continuous casting plants, hot rolling mills, cold rolling mills, strip plants, section rolling mills, pipe manufacturing plants and hot pressing and forging, and aluminium rolling, copper and other non-ferrous metal plants) is not absolutely necessary, however, the question of the precise product market definition in mechanical metal plant building can therefore ultimately remain open.
- (232) It can also remain open whether a separate overall market for mechanical iron and steel plant building should be assumed or whether an overall market for mechanical metal plant building covers both ferrous and non-ferrous metals. In its notification of the merger project, Siemens assumes, as already mentioned, that there is a larger market for mechanical metal plant building, which comprises the following segments: pig iron making, steel making, continuous casting plants, hot rolling mills, cold rolling mills, section rolling plants, strip plants, pipe manufacturing plants, hot pressing and forging, aluminium rolling mills and copper and other non-ferrous

⁹⁴ With regard to the distinction between the process steps ironmaking and steelmaking it must also be pointed out that SMS, as is shown in SMS-internal papers is planning an exit from mechanical plant building for ironmaking (Cf Meeting of the Shareholders' Committee of SMS Demag of 21 March in Munich, presentation of the SMS Board)

⁹⁵ Market investigation, Phase II - replies to competitor and customer questionnaires. Smaller specialists are moreover usually ranked lower than full liners by competitors and customers in regard to their competitive strength. This also holds true for (isolated) mentionings of specialised non-European competitors. SMS-internal information (Cf Meeting of the Shareholders' Committee of SMS Demag of 21. March in Munich) and information supplied by market participants (Market investigation, Phase II - replies to competitor and customer questionnaires) shows that e.g. with regard to Chinese companies that these are considered capable of a market entry outside China predominantly in ironmaking (and to a much lesser extent in steelmaking and not at all in other process steps).

⁹⁶ IV/M.1450 - SMS/Mannesmann Demag.

⁹⁷ See also IV/M.1450 - SMS/Mannesmann Demag.

metal plants. All these sectors, with the exception of aluminium rolling mills and copper and other non-ferrous metal plants, concern process stages in iron and steel production and processing. According to Siemens,⁹⁸ [...] The Commission's market survey produced nothing to disprove this. The fact that non-ferrous metals are of secondary importance in mechanical plant building means that, for the purposes of this Decision, the assessment of a possible overall market in mechanical metal plant building does not depend on whether non-ferrous metals are included in such a market or not. Another reason why this is so is that the market strength of SMS and VA Tech in non-ferrous metals (especially in the only significant non-ferrous sector, aluminium rolling) is, according to the market survey, roughly the same as in the cold rolling of iron and steel.⁹⁹

(c) Electrical metal plant building

(1) Overview of the individual electrics and automation areas

- (233) Both Siemens and VA Tech are active in the area of electrical metal plant building.
- (234) Electrical metal plant building comprises firstly "level 0" automation, secondly actual automation (levels 1 and 2) and thirdly the more recent area of IT solutions for plant logistics/MES (level 3).
- (235) Level 0 automation means the electrics (general electrification of the plant), drives and sensors.
- (236) Actual automation consists of level 1 and level 2 automation.
- (237) The components of level 1 are the IT platform (automation system), the human-machine interface or HMI (the control unit), the basic automation and a series of technological control systems (such as thickness, width, surface evenness and temperature of the metal).¹⁰⁰ Frequently the drive control (as opposed to the drives themselves) is allocated to this area.
- (238) Process automation ("level 2") consists of complex mathematical process models for calculating the relevant correct adjustment and conversion of the plant (segment) and the quality of the products produced, taking the individual pre-calculated production parameters as a basis and processing a large number of individual production measurement data.
- (239) IT solutions for plant logistics, also known as manufacturing execution systems (MES) or level 3 automation, are a rapidly developing special area, which is no longer part of the automation itself, but also forms part of electrical metal plant building in the broad sense. These are essentially integrated solutions for controlling and monitoring the logistics of a production plant.

(2) No uniform market for electrical industrial plant building: at least a separate market for electrical metal plant building

⁹⁸ Notification of the merger project (Form CO).

⁹⁹ See below, paragraph (319).

¹⁰⁰ The concept of the technological control system (TCS), however, is also generally applied to level 1/level 2.

- *Siemens' standpoint*

(240) Siemens does not assume that electrical industrial plant building for the metallurgical sector is a separate market, but takes the view that electrical industrial plant building is as a whole independent of any sector. According to Siemens, tailoring the products and services to a specific use such as the metallurgical sector takes place through process technology. Consequently, applying this line of argument, the fact that among electrical plant builders a certain focusing on particular customer segments for strategic reasons is not unusual does not invalidate the general nature of electrical industrial plant building.

(241) Siemens emphasises in the statement on the decision under Article 6(1)(c) of the Merger Regulation and in the comments on the statement of objections [*There follow comments on the use of standardised products*]*

(242) Siemens also indicates that major electrical industrial plant builders are active in various sectors. Sector-related specialisation is the exception among the suppliers of electrical industrial plant.

(243) Finally, Siemens says [*There follow comments on the level of specialisation of the engineers used and on the importance of references* ¹⁰¹]*

- *Results of the market investigation*

(244) In the context of the market investigation carried out by the Commission, however, the majority of market participants felt that special know-how was necessary for constructing electrical plants in the metallurgical sector.

(245) Competitors particularly stressed the specialisation of their metal plant building engineers in their statements.

(246) Siemens' citing of the limited degree of specialisation of its metal plant building engineers is not conclusive on this point. [*There follow comments on the importance of the level of skills of the engineers employed and on the internal organisational structure of Siemens*]* ¹⁰² Also, from other statements made by Siemens, it is unlikely that there is a low degree of specialisation among staff.¹⁰³

(247) Furthermore, the frequently mentioned importance of reference lists in the replies to the market investigation suggests that the majority of customers demand relevant experience in the metallurgical sector from the respective suppliers. [...] ¹⁰⁴*

(248) In addition to this, the view of the market [...] ¹⁰⁵ [*There follow comments on the sector-specific or non-specific nature of electrical metal plant building*]*.¹⁰⁶ This fact alone indicates that a separate product market is assumed.

¹⁰¹ See, for example, presentation text "Discussion with DG Competition on 15.4.2005".

¹⁰² [...]*

¹⁰³ [...] (reply to the request for information of 29 March 2005, Annex 1.c, sheet 45).

¹⁰⁴ [...]*

¹⁰⁵ Reply to the request for information of 29 March 2005. [...]*

¹⁰⁶ See reply to the request for information of 29 March 2005. [...]*

- (249) Marketing in electrical metal plant building is sector-specific. [*There follow comments on marketing expenditure* .¹⁰⁷]*
- (250) [*There follow comments on Siemens' research and development activities...*¹⁰⁸]*
This [...] research activity is reflected in a significant number of patents.¹⁰⁹ VA Tech also has a considerable number of copyright-protected developments for electrical metal plant building. [*There follow comments on Siemens' research and development activities*]*¹¹⁰
- (251) The significant development costs and the long time it takes to develop products and services were also confirmed in the Commission's market investigation.¹¹¹
- (252) A further indication of an increasing sector-related specialisation is the advance of the earlier mechanical metal plant building specialists, Danieli, SMS Demag and VAI, into the area of electrical metal plant building. These companies are almost exclusively active in a sector-specific way in metal plant building. Market share gains by these companies confirm the trend toward sector specialisation in electrical metal plant building. Even medium-sized companies such as Küttner, MINO, Kleinknecht and Gefeba are focused very strongly or exclusively on metal plant building.
- (253) This trend towards specialisation in the metallurgical sector, in which, in both mechanical and electrical metal plant building, specialised process technology know-how is needed (and not only, as perhaps in the past, in mechanical industrial plant building) [*There follow comments on the availability of process-technology know-how at Siemens and on the internal assessment of mechanical metal plant building by Siemens*]*^{112 113}
- (254) Through this moving closer together or meshing of mechanical and electrical metal plant building, electrical metal plant building too is becoming increasingly sector-specific.
- (255) The Commission's market investigation also showed that in the area of electrical equipment, drives and partly also sensors (i.e. in the level 0 area), at product and component level there is only relatively little specialisation.¹¹⁴ Electrical and drive

¹⁰⁷ Siemens' reply to the Commission request for information of 2.3.2005, Annex 10.

¹⁰⁸ Siemens' reply to the Commission request for information of 2.3.2005, Annex 9.

¹⁰⁹ Siemens' reply to the Commission request for information of 2.3.2005, Annex 8.

¹¹⁰ [...]*

¹¹¹ One competitor stated that the costs of developing products and solutions for this industry are so high that only major global companies could think about going into this business (anonymised results of the market survey).

¹¹² See, for example, the sheet which was presented by Siemens at the discussion with the Commission on 23 March 2005 [...]*

¹¹³ [...]*

¹¹⁴ For example, one competitor referred to special requirements of engines used in the rolling mill sector which need to be particularly shock-resistant. Siemens replied that even engines which are used to drive winding gear in underground and opencast mining, paper machines or on ships must have comparable high shock tolerance. For the purposes of this investigation, however, it is not necessary to decide this question, since VAI does not make such engines. While the fellow subsidiary Elin EBG manufactures drives, the market survey shows that they are comparatively insignificant for metallurgical applications.

products and sensors of measuring instruments (components) used in metal plants can also be used in other industrial plants in a similar form.

(256) On the other hand, this does not apply to the products in the area of automation proper (levels 1 and 2), where increasing specialisation is being seen. Indeed, it is also true here that certain HMI products and IT platforms (automation systems) are exhibiting general characteristics.¹¹⁵ What is important, however, is that these systems require special sector solutions (software modules) in order to be usable.¹¹⁶ Siemens and its competitors develop sector solutions such as these in electrical industrial plant building in sector-specific product families, the core use of which is in the level 1 and level 2 areas of automation. For example, Siemens has two of these sector-specific product families (“Simelt” for the blast furnace area and “Siroll” for the rolling mill area), SMS Demag has one (“X-Pact“ for the whole metallurgical area),¹¹⁷ as has VAI (“Vaioneer”).

(257) In any case, from the buyer's point of view, the products and services of other electrical metal plant building, with the exception of non-specific individual components, are not exchangeable with the products and services of electrical industrial plant building. From the supplier's point of view as well, clear specialisation in electrical metal plant building is necessary which, as in the case of Siemens, does not conflict with the parallel development of a general electrification and automation basis.

- *Discussion of Siemens' opinion in the comments on the statement of objections*

(258) Siemens refers in its comments to what it sees as the high degree of supply substitutability, since solutions rely on standardised products, which only need a little sector- and customer-specific adaptation, suppliers require specialised engineers only to a slight extent and there are no particular obstacles to suppliers from (other) electrical industrial plant building starting to operate in the metallurgical sector.

(259) Siemens' argument is not valid. First, while metals-specific products and services (solutions) often rely on general products and services that can also be used in other industries, the sector-specific value added is so significant that it cannot be developed and supplied at all for a large number of the products and services required by customers without spending considerable extra time and money. This applies in particular to the in-line aspects of these products and services, and especially to the area of automation proper. To put it at its starkest, many firms may be able to supply the lighting installations or even the power supply for a metal plant without special metallurgical experience, but they cannot supply the appropriate

¹¹⁵ [...] * Even with Simatic TDC the Siemens product information stresses its use in the metallurgical sector: “The most complex control loops in the shortest scanning times are calculated with it, such as is needed in large plants in the blast furnace and rolling mill sector.”

(http://www2.automation.siemens.com/simatic/regelsysteme/html_00/produkte/rb-tdc.htm).

¹¹⁶ Anonymised results of the market survey: one competitor declared that of 4 specific products/solutions which he developed for electrical metal plants, only one of the products can be used to more than a small extent in other electrical industrial plants and two of these products cannot be used at all in those plants. [...] *.

¹¹⁷ “X-Pact [is] one of the most successful sector solutions in the world of blast furnace and rolling mill engineering.” (SMS homepage).

technological control and regulatory systems or the quality control and calculation models for the actual production process, where, according to market participants, there are considerable barriers to entry. When, as regularly happens, a contract is awarded for the all the electrical installations in a plant, including the metallurgy specific aspects (i.e. a total package including components purchasing, systems integration and equipment installation and putting into service), there is insufficient supply substitution among suppliers operating in other sectors. This accords with the view of a clear majority of customers that electrical plant building in the metallurgical sector should be regarded as sector-specific.¹¹⁸

- (260) Second, given the results of the market survey, it is not correct that suppliers require specialist engineers only to a slight extent. A majority of suppliers indicated even that electrotechnical plant building engineers operating in the metallurgical sector are often “highly” specialised in metallurgy.¹¹⁹
- (261) Third, for the reasons mentioned (need to build up specific metallurgical know-how, need for metallurgical references, costs incurred by and time required for this), there are particular obstacles to suppliers from electrical industrial plant building starting to operate in the metallurgical sector.¹²⁰
- (262) For the reasons given, therefore, for the purposes of the product market definition in this Decision, electrical plant building is assumed to be specific for at least the metallurgical sector.¹²¹ As emerges from the discussion below of IT solutions for plant logistics/MES/level 3¹²² and of aluminium hot and cold rolling,¹²³ such an overall market can be defined either as an overall market for electrical metal plant building including all possible submarkets discussed below or, more narrowly, as a possible overall market for electrical metal plant building at automation levels 0-2 in the iron and steel sector.¹²⁴

(3) Possible separate markets for individual process areas or steps

- (263) Market participants, moreover, assume that the market for electrical plant building is further subdivided by metal manufacture process stage.¹²⁵ Thus a clear majority of responding competitors stated that their electrotechnical engineers working in metal plant building have either a “certain/partial” or even a “strong” intra-metallurgical specialisation.¹²⁶

¹¹⁸ Results of the market survey, Customers, Phase I.

¹¹⁹ Results of the market survey, Competitors, Phase II. More than two thirds of the responding competitors assumed that their electrotechnical plant building engineers were either highly or partly specialised in metallurgy.

¹²⁰ The example of an “entry” cited by Siemens should be understood as such. At best, it is a partial entry, as is clear from the following statement of this market participant: “Our focus is only the steel market in Upper Austria. As we are doing business there for only 5 years, we are not able to answer this question properly.” [NB The question concerned the listing of competitors operating in a particular process stage.] In the reply to the statement of objections, Siemens does not go into these barriers to entry specifically.

¹²¹ Siemens itself notes in this respect, in its comments on the statement of objections, that such an approach “can still be justified possibly” (p. 9).

¹²² See paragraph (274).

¹²³ See paragraphs (271)-(273).

¹²⁴ See also paragraph (275).

¹²⁵ See explanation of process stages in paragraph (225).

¹²⁶ See replies to the competitors’ questionnaire Metallurgy, Phase II.

- (264) References to a more extensive subdivision of the relevant product markets can also be found in Siemens' internal papers.¹²⁷ Similarly, Siemens' product development takes account of the differences in process areas and process stages. Siemens clearly distinguishes the liquid phase process area terminologically and in marketing terms from the hot and cold phase process areas by using the product family name "Simelt" for the former and "Siroll" for the latter. *[There follow comments on the Simelt and Siroll product families and the relevant internal assessment of the competitive situation by Siemens. ...]*^{128 129}
- (265) The main technological requirements are also clearly different for each process area: while in the liquid phase the controlling of the smelting process and what happens during smelting is paramount, it is the rolling process which is the defining element for both the hot rolling and the cold rolling phase. In addition to this, in the hot phase the controlling of the cooling process is of central importance, while surface evenness monitoring and controlling are of decisive importance for the cold phase. There are even clear technological differences within the process areas for the individual process stages.¹³⁰
- (266) The Commission's market investigation showed that among [...] competitors there are comparable internal differentiations by process area and process stage, e.g. separate business units. Competitors also arrange their marketing very differently according to the individual process areas and process stages.¹³¹
- (267) Reference lists are drawn up per process stage and, as the Commission's market investigation has shown, orders are mainly awarded separately for one process stage. Suppliers must therefore try to be able to offer as complete an automation package as

¹²⁷ See the sheet in the Siemens presentation "Discussion with DG competition on 15.4.2005 and GSL Jour Fix, 29.1.2001, Annex 2. Reply to the request for information of 7.4.2005 (part 2). Reply to the request for information of 29 March 2005, Annex 1.b, sheets 6 and 7 and Annex 1.d, sheet 4. Reply to the request for information of 29 March 2005, Annex 1.n, sheet 85. [...] Reply to the request for information of 29 March 2005, Annex 1.a, sheet 37. [...] See reply to the request for information of 29 March 2005, Annex 1.n, sheet 33. ¹²⁸ Reply to the request for information of 29 March 2005, Annex 1.n, sheet 33.

¹²⁹ [...] Reply to the request for information of 29 March 2005, Annex 1.c, sheet 6.). Sheets 8, 12 and 13 [...].

¹³⁰ Thus the Commission's market survey clearly revealed that the technological regulating systems and control models for level 1 and 2 automation show considerable technological differences between the continuous casting and hot rolling process stages. For instance, in continuous casting, the element of rolling controlling found in hot rolling is lacking. There are also clear differences between hot rolling and cold rolling. In strip processing lines, drive solutions are substantially simpler than in cold rolling plants etc.

¹³¹ See for example the tender lists submitted by competitors, including VA Tech's list. See on this also VA Tech's information brochure: "The World of VAI Automation" (www.vai.at), in which electrical metal plant building is broken down into the following individual areas: "Ironmaking", "Steelmaking", "Continuous Casting", and "Rolling/Processing". The "Rolling/Processing" area is subdivided further by VAI in this brochure as well as in other parts of the homepage into "Hot Rolling" (hot rolling of strip steel, so-called hot strips), "Plate Mill" (hot rolling of steel plates, so-called thick plate mills), "Cold Rolling", "Strip Processing" as well as "Long Product Rolling" and "Aluminium Rolling". The last area mentioned in this brochure, "Plant-wide Solutions" refers to Level 3/MES. See also SMS's website and its automation brochures.

possible for each process stage. Both the costs of entering the market for each process stage and the development time are considerable.¹³²

(268) In addition to the above division into process areas and process stages it should be noted, on the basis of the findings of the market survey, that there are clear signs that the rolling of long products forms a separate product market to the flat-product hot and cold rolling process stages, with different technological requirements, different customers and suppliers set up differently.¹³³

(269) For the purposes of this Decision, however, it can ultimately be left open whether separate electrical product markets exist for the three main process areas of electrical metal plant building (liquid phase, hot phase, cold phase) and the special area of long product rolling. Similarly, the question of a further subdivision by process stage can be left open for the purposes of this Decision.

(4) Separate sub-markets for level 1 and 2 automation

(270) As to whether for the purposes of defining the relevant product markets a distinction should be made according to the individual levels of automation, in particular levels 0, 1 and 2, the market survey showed that both demand and supply in the individual automation levels are different overall and as regards each process stage. For the purposes of this Decision it can remain open, however, whether separate product markets should be assumed, say, for levels 1 and 2 together, or subsets thereof, or for level 0.¹³⁴

(5) Separate markets for the iron and steel sector and the aluminium sector, in particular for aluminium hot and cold rolling

(271) The distinctiveness of the electrical iron/steel plant building markets in the process stages which come *before* hot and cold rolling in the manufacturing process is evident from the very fact that Siemens and VA Tech, like other major suppliers in the iron and steel sector, are hardly active, if at all, in the corresponding areas outside the iron and steel sector. There is therefore insufficient supply and demand substitution.

(272) In the context of the Commission's market survey, it was also said that aluminium hot and cold rolling too (including foil rolling), in which Siemens and VA Tech are active, form separate product markets. This was justified by the different process

¹³² See anonymised results of the market investigation: "One competitor explained that development work for various specific products/solutions for hot rolling steel mills took 3-10 years."

¹³³ Reply to the request for information of 29 March 2005 (Annex 1.a, slides 37 and 38). [...] * See also the clearly different assessment of customers (and competitors) concerning the list of suppliers in long product rolling and flat product rolling. In the case of long products, Danieli clearly heads this assessment, while in the rolling of flat products (both in the process stages and, aggregated, in the process areas) it clearly comes behind other market participants, such as Siemens, VAI and SMS. The replies of competitors to the question whether for long product rolling other software for technological control modules and models is necessary than for the hot rolling of flat products also suggest a separation into different product markets.

¹³⁴ In the context of this Decision, however, level 0 does not need to be discussed further in the metallurgy part, since the products in question, in so far as horizontally affected markets are present, are discussed in the sections on energy transmission and distribution (T&D) and drives. On the absence of vertical effects, see generally paragraphs (397) – (400). On the question of further delimitation regarding level 3 automation (IT solutions for plant logistics) see paragraph (274) below.

engineering requirements for steel and aluminium, in particular in the hot rolling process, especially as regards temperature behaviour, rolling speed and surface characteristics.

(273) For the purposes of this Decision, however, the question of product market conformity/separation as between the rolling markets in the iron/steel and aluminium sector can also remain open.

(6) Possible market for IT solutions for plant logistics/MES/Level 3

(274) The Commission's market investigation also revealed a number of indications of a separate, possibly emerging metals-specific product market for IT solutions for plant logistics/ MES/level 3.¹³⁵ However, the question of the latter's sector specificity and its inclusion in, or separation from, an electrical metal plant building market can ultimately be left open for the purposes of this Decision, since, although in this sector there is product overlapping between Siemens and VA Tech, no competition concern was established in the Commission's market investigation, however the product market was defined. From today's standpoint at any rate this area is not part of electrical metal plant building proper in the narrow sense (levels 0-2).¹³⁶ Moreover, the precise product market definition of the IT solutions area for plant logistics/MES/level 3 can remain open for the purposes of this Decision.

(7) Two possible overall markets for electrical metal plant building

(275) It should be repeated for the sake of clarification (see paragraph (262)) that, as a result, two possible "overall markets" for electrical metal plant building should be investigated: (i) an overall market for electrical metal plant building, including all the possible electrical metal plant building submarkets mentioned, and (ii) a possible (more narrowly understood) market for electrical metal plant building at automation levels 0-2 in the iron and steel area (i.e. excluding the possible markets for aluminium rolling and IT solutions for plant logistics/MES/level 3).

(d) Maintenance and servicing

(276) The activities of Siemens and VAI also overlap in the field of maintenance and servicing of industrial plant, in particular in electrical metal plant.

(277) Siemens assumes a separate service market for providing services to metal plants, which, in addition to carrying out maintenance work, also includes advisory and support services such as education and training events.

(278) [...] *¹³⁷

(279) The Commission's market investigation has shown that such services are indeed to a large extent separate from actual plant building and are sought from other suppliers.

¹³⁵ [...] *. Reply to the request for information of 29 March 2005, Annex 1.c, sheets 15-20). [...] * (See, for example, reply to the request for information of 29 March 2005, Annex 1.k, sheet 46 and all similar points. [...] *)

¹³⁶ [...] *

¹³⁷ See for example reply to the request for information of 29 March 2005, Annex 1.k, sheet 46 and all similar points. [...] *

Furthermore, a considerable proportion of these services is looked after by the buyer itself. Given the results of the market investigation¹³⁸ it can be concluded, however, that the area of maintenance and service provision is not part of the electrical metal plant building market. For the purposes of this Decision, however, a more comprehensive, precise market definition can be left open in this area.

(e) Electrical industrial plant building in non-metal sectors

- (280) As mentioned, Siemens assumes a common product market for all areas of electrical industrial plant building.
- (281) In non-metal electrical industrial plant building, VA Tech operates exclusively through its subsidiary Elin EBG, unlike in metal industrial plant building where it is (mainly) represented by its subsidiary VAI. Electrical installations are manufactured in particular for plants in the motor vehicles, oil and gas, pharmaceuticals, paper, cement and food, beverages and tobacco industries. Siemens operates in particular in the oil and gas, pharmaceuticals, paper, cement and food, beverages and tobacco industries.
- (282) For the purposes of this Decision, the question of the sector-specific market definition of non-metal electrical industrial plant building can be left open, since the proposed merger does not raise competition concerns under any possible market definition (i.e. either as a market covering several sectors or as a separate market per sector).

(f) Summary of the product market definition in metal plant building and in industrial plant building in other sectors

- (283) For the purposes of this Decision, therefore, in the area of mechanical metal plant building, the following product markets are assumed:
- an overall market for mechanical metal plant building (either restricted to ferrous metals or comprising both ferrous and non-ferrous metals);
 - the possible submarkets for mechanical metal plant building (see paragraph (231)).
- (284) For the purposes of this Decision, in the area of electrical metal plant building, the following product markets are assumed:
- the overall market for electrical metal plant building, including all possible consequent submarkets;
 - the possible (more narrowly understood) overall market for electrical metal plant building at automation levels 0-2 in the iron and steel sector;
 - the possible submarkets for electrical metal plant building of the liquid phase, hot phase, cold phase and rolling of long products (process area markets) in the iron and steel sector and the possible process stage markets (or further subdivisions e.g. by automation level), and possible level 1 and 2 submarkets;

¹³⁸ [...] * See reply to the request for information of 29 March 2005, Annex 1.i, sheet 14 [...] * Reply to the request for information of 29 March 2005, Annex 1.c, sheets 21-32). [...] *

- the possible markets for aluminium hot and cold rolling;
 - the possible market for IT solutions for plant logistics/MES/level 3.
- (285) For the purposes of this Decision, moreover, at least one separate product market should be assumed for metal plant maintenance and servicing.
- (286) The product market definition in electrical industrial plant building in other sectors can be left open for the purposes of this Decision.

2. Relevant geographic markets

(a) Mechanical metal plant building

- (287) Siemens assumes that the market for mechanical metal plant building is a world market. It asserts that, in the context of tendering procedures, there is a worldwide demand for the services in this area. The products and services are basically the same in all parts of the world and aimed at the – globally uniform - physical, chemical and mechanical characteristics and properties of metal processing. Quality differences between the plant builders operating worldwide play no part, only price determines which supplier is selected. However, prices do not vary greatly worldwide. Transport costs in particular are of no consequence in this area.
- (288) In its comments on the statement of objections, Siemens takes the view that the market is at least EEA-wide, with a strong tendency to become worldwide.
- (289) The Commission's investigations have revealed that demand in this area is EEA-wide and possibly even wider. While within the EEA there are definite remnants of national and language-area-related demand patterns,¹³⁹ the essential competition parameters are at least EEA-wide. However, so far in the EEA non-European suppliers have clearly been awarded orders only on a small scale. Even if, according to the market participants, transport costs scarcely play a role in this respect, the majority of customers perceive the quality of European products¹⁴⁰ to be more reliable. Historical closeness to the supplier clearly also plays a part, as do the costs of regional market entry (e.g. through the need to set up engineering branches without having already worked out their capacity utilisation). It should also be noted that regional price comparisons in this heterogeneous market/these very heterogeneous markets are very difficult. However, the Commission's market investigation showed that the general price level of metal plant building in China is lower.¹⁴¹ The remarks in paragraph (299) below, which apply in this respect to mechanical metal plant building too, should also be noted.
- (290) The European suppliers, at any rate the large ones, are organised globally, however, in the sense that they relate to several continents and make a large proportion of their turnover outside the EEA.

¹³⁹ The reasons given for this were partly different legal provisions as well as tenders written in the language of the country. Furthermore, the geographical proximity to the customer, in particular in connection with support in problems of a technical nature, seems to play some role.

¹⁴⁰ Where European firms also use non-European components, this also applies to the European quality control/guarantee of these non-European components.

¹⁴¹ [...]*

(291) For the purposes of this Decision it is not necessary, however, to decide the question of geographic market definition, since under each possible geographic market definition (EEA-wide or wider than the EEA), the concentration gives rise to competition concerns. The same applies for the same reasons to all possible submarkets in mechanical plant building.

(b) Electrical metal plant building

(292) In the area of electrical industrial plant building, too, Siemens assumes that there is a world market and asserts that particularly in large projects tenders and bids take place on a global level. Siemens also says that the end-customers are predominantly internationally active companies which operate plants in several countries.

(293) In this area too, the Commission's findings have revealed that demand from the majority of the customers in the EEA for electrical metal plant building is EEA-wide. Even if, in this area, transport costs play a rather subordinate role, the geographical or linguistic proximity to the respective suppliers still appears to customers to be important, in order to be able to make contact rapidly and without complications in the event of technical problems. Even within the EEA certain customer preferences¹⁴² for or against certain suppliers and certain regional strengths and weaknesses still result from this and from historical links, but from the point of view of most of the customers and suppliers these features do not invalidate the assumption of an, at least, EEA-wide geographic market.

(294) [...] ¹⁴³ [...] ¹⁴⁴ For the efficient handling of project orders it is also necessary to have strong regional branches, just as the involvement of local value added greatly increases the chances of a bid being accepted or is even a precondition for winning an order.

(295) Asian companies in particular have so far hardly received any orders in the EEA. Conversely, successful business activity appears to many European companies to be difficult, for example, in Japan because of the existing competition situation. In discussions about the market by European companies, it is typically assumed that there is a theoretical world market volume and a clearly smaller "accessible" world market volume. [...] ¹⁴⁵ Even if European customers require European suppliers to operate successfully worldwide (and therefore to be able to produce extra-European references as well), this does not allow the opposite conclusion that non-European suppliers without references in the EEA are seen by European customers as equivalent alternatives to European suppliers. The small number of EEA references for non-European suppliers is thus also an obstacle to extending the relevant geographic market.

(296) On the other hand it was clear from the Commission's market survey that a not inconsiderable number of customers considered that it was quite possible that in the next 2-3 years Japanese companies would enter the European market and therefore

¹⁴² Reply to the request for information of 29 March 2005 [...]*

¹⁴³ Reply to the request for information of 29 March 2005, Annex 1 b sheet 11 [...]*

¹⁴⁴ Reply to the request for information of 29 March 2005, Annexes. [...] * Reply to the request for information of 29 March 2005, Annex 1.c, sheet 6.).

¹⁴⁵ [...] * Reply to the request for information of 29 March 2005, Annex 1.1, sheet 5: [...]*

appeared not to have fundamental quality reservations about these companies.¹⁴⁶ It does not yet follow from this information, however, that there is sufficient effective, direct supply substitutability.¹⁴⁷

(297) It therefore seems appropriate for the purposes of this Decision to define the market as at least EEA-wide. Whether the market is EEA-wide or worldwide can, however, remain open for the purposes of this Decision.

(298) This applies for the same reasons to all the possible electrical metal plant building submarkets and markets, including the possible market for IT solutions for plant logistics/MES/level 3.

(299) In considering the competitive position of the individual competitors, the following is to be taken into account.

- Even if the analysis is confined to a market which is only EEA-wide, consideration of the worldwide market shares of the competitors which are strong in the EEA is relevant. European customers have predominantly said that it is absolutely necessary even for a European competitor to be a strong supplier worldwide. Therefore, for marketing reasons too, worldwide market successes are of great importance for European competitors. Worldwide market shares of European competitors also give information about the market strength of these competitors in large projects and help to prevent a distortion due to possibly too small (and therefore not sufficiently representative) order volumes in Europe. This is of course particularly true for smaller submarkets.
- Even if it is assumed that there is a world market in the sense of a geographic market which extends beyond Europe and encompasses several continents, market relations on such a worldwide market are by no means homogeneous. It is even possible that a considerable part of the hypothetical world market volume is not accessible due to regional peculiarities or follows different market rules. For instance, in the Peoples' Republic of China - one of the most important customers on such a world market for electrical metal plant building - the volume of plant building continues to be strongly controlled. [*There follow comments on Siemens' internal assesment of the demand situation in China and Japan*]*^{148 149}

(300) Siemens agrees with the Commission's geographic market definition in electrical metal plant building only in so far as the Commission considers the possibility of a market which extends beyond the EEA, but it rejects the view that certain Asian regions cannot be included in the relevant market. The corresponding submarkets are completely accessible even to foreign suppliers.

(301) The Commission maintains its view, however, that certain geographic world regions have clearly different competitive behaviours. As established, it can however remain open whether there is an EEA-wide or a worldwide market (the latter

¹⁴⁶ Account should be taken, however, of the constraint expressed in paragraph (324) regarding this expectation, which also applies mutatis mutandis to electrical metal plant building.

¹⁴⁷ Within the meaning of the Commission notice on the definition of the relevant market for the purposes of Community competition law (OJ C 372, 9.12.1997, p. 13, paragraph 20).

¹⁴⁸ [...]*

¹⁴⁹ See [...]* Reply to the request for information of 29 March 2005, Annex 1.1, sheet 20, [...]*.

including/excluding in particular Japanese demand and a possibly “inaccessible” part of the Chinese market).

(c) Maintenance and servicing

- (302) From Siemens' point of view, the market for servicing and maintenance work is to be defined as being EEA-wide, but is perceived by the majority of market participants as being narrower, since geographical proximity to the supplier and partly also sharing a common language are seen as being particularly relevant here. A number of customers would also not select a supplier from a different Member State than the location of their own production site, if the prices for services from their current suppliers were to rise by 5-10%. This applies to both the mechanical and the electrical sector.
- (303) For the purpose of this Decision, a precise market definition can ultimately be left open. The relevant geographic market, in any event, is not smaller than national and not bigger than EEA-wide.

(d) Electrical industrial plant building in other sectors

- (304) The corporate organisation of VA Tech, with the metal plant builder VAI as a company operating worldwide and Elin EBG which provides electrical plant building generally, is largely concentrated in Austria and is also increasingly active in industrial plant building in central Europe, suggests that the market/markets for other electrical industrial plant building should be defined more narrowly in geographical terms than those for specialised electrical metal plant building. This view was confirmed in the Commission's market investigation, where many of the responding industrial firms assumed, if anything, national markets or markets comprising several Member States in their replies. If necessary, a larger than transnational regional geographic market can be considered for some specialised process industries, such as paper and chemicals. But there were no indications in the Commission's market survey that the geographic market should be perceived as bigger than the territory of the EEA.
- (305) For the purpose of this Decision, a precise market definition can ultimately be left open. The market/markets concerned, in any event, are not smaller than national and not bigger than EEA-wide.

3. Competition assessment

(a) Mechanical metal plant building

- (306) The merger would lead, essentially as a result of Siemens' shareholding in SMS and the special rights arising from this shareholding, in the EEA-wide or worldwide market for mechanical metal plant building or its submarkets for mechanical plant building for steelmaking and for continuous casting to a substantial weakening of competition between Siemens/VA Tech and its main competitor SMS. This in turn would lead to a significant impediment to effective competition in the above-mentioned submarkets in particular as a result of the creation of a dominant position on the part of Siemens/VA Tech.

(1) *Market conditions*

- (307) Only VA Tech, and not Siemens, is active in this area. According to Siemens, in 2003 VA Tech's share of the world market came to less than [5-10]*% and of the EEA market to less than [10-15]*%. Looking at individual submarkets, Siemens assumes that VA Tech's shares in mechanical plant building in pig iron making and steelmaking and also in continuous casting at EEA level are about [5-10]*%. Regarding the other possible submarkets (hot rolling mills, cold rolling mills, section rolling mills, strip mills, pipe mills, pressing and forging, aluminium rolling mills and copper plants), Siemens estimates the EEA-wide share of VA Tech at about [10-15]*%.
- (308) By contrast, market participants assumed considerably higher market shares for VA Tech in individual possible product markets in mechanical plant building. Thus, the worldwide and EEA market shares of VA Tech in the mechanical metal plant building market were seen in some cases as being close to those of the previous sole market leader SMS-Demag (hereinafter: "SMS") (followed by the third and only other complete supplier active in the EEA, Danieli). In individual possible mechanical submarkets VA Tech is in any case seen as the clear market leader.¹⁵⁰ Statements by market participants also suggest that the market or markets for mechanical metal plant building are to be regarded as highly concentrated.
- (309) Siemens' internal documents and documents drawn up on its behalf do not confirm the above market view presented by Siemens within the framework of this proceeding.

*[There follow comments on Siemens' internal strategic and analytical investigations of the competitive environment]** ^{151 152 153 154 155}

- (310) SMS sees VAI as its main competitor in most of its business areas. SMS gives its own market shares and those of VAI in mechanical metal plant building overall as [20-30]*% and [20-30]*%. In individual process stage markets the combined market shares of the two leading firms are significantly higher, namely in steelmaking ([30-40]*%, [30-40]*%), continuous casting ([20-30]*%, [60-70]*%), hot rolling ([50-60]*%, [15-20]*%) and cold rolling ([40-50]*%, [10-15]*%).¹⁵⁶
- (311) At the shareholders' committee meeting of SMS GmbH/MDKM of 18 May 2004 a planning document for 2004/2005 was presented. This shows the market share in mechanical metal plant building of SMS and its competitors for the period 1999-2003. SMS is considered to have a share of [30-40]*%, VAI [15-20]*%, Danieli [10-15]*%, Japanese suppliers [5-10]*% and "others" [30-40]*%. In individual process stages SMS and VAI have a much larger market share (e.g. steelmaking/converters: SMS Demag: [40-50]*%, VAI [30-40]*%; continuous

¹⁵⁰ See paragraph (319) for details.

¹⁵¹ [...]*

¹⁵² [...]*

¹⁵⁵ [...]*

¹⁵⁶ SMS, Key Document.

casting/slab casting: SMS Demag: [20-30]*%, VAI [50-60]*%).¹⁵⁷ By and large, the latter figures are confirmed publicly by VAI.¹⁵⁸

(2) Overall market for mechanical metal plant building in the area of iron and steel or overall market for mechanical metal plant building including non-ferrous metals: significant impediment to effective competition

(312) [...]*,¹⁵⁹ on the basis of the facts it cannot be assumed that solely with the removal of this potential competition there would be a significant impediment to effective competition in the common market.

(313) The Commission's market investigation has shown, however, that the merger would lead to a substantial weakening of the current competition between VAI and SMS owing to Siemens' minority stake in SMS. Because of VAI's market strength in this highly concentrated market and the very close competition between VAI and SMS¹⁶⁰ and because other competitors alone would not be able to restrict Siemens/VAI's competitive room for manoeuvre sufficiently, the merger would in any event pose a significant impediment to effective competition through uncoordinated behaviour and possibly also by creating a dominant position for Siemens/VAI.

(a) VAI and SMS are the market leaders in a highly concentrated market

(314) VAI and SMS are the strongest competitors in the highly concentrated market for mechanical metal plant building, as can be seen from the remarks made at the beginning on market structure.

(315) [...]*

(316) [...]*¹⁶¹

(317) [...]*¹⁶²

(318) Thirdly, the importance of market shares in tender markets is relative and must be interpreted in the light of the specific impact of the merger proposal on bidding behaviour.

¹⁵⁷ [...]*

¹⁵⁸ "VAI has become the world market leader in slab casting technology. During the past five years, for example, our company has supplied 43% of all new slab casters and carried out 62% of all slabcaster upgrading projects." "VAI is one of the pioneers of slab casting technology. This is reflected by numerous trailblazing developments." "With a share of nearly 60% of all stainless-steel slab casters supplied during the past eight years, VAI is the world market leader in this field." (http://www.vai.at/view.php3?r_id=198&LNG=EN).

Further remarks in the same place referring to technological leadership are: Strip casting "is perhaps the most exciting leapfrog technology in the iron and steel industry today" "Eurostrip®: ThyssenKruppSteel, Usinor and VAI – more than 1000 patents in 100 patent families" – (two plants in Krefeld and Terni).

¹⁵⁹ See, for example, reply to the request for information of 29 March 2005, Annex 1.n, sheet 17, See reply to the request for information of 29 March 2005, Annex 1.l, sheet 17 [...]* and sheet 14 [...]* .

¹⁶⁰ See the results of the market survey, Phase II, in particular as regards the ranking of the market leader and closest competitor.

¹⁶¹ See also paragraph (312) on the potential competition from Siemens, whose elimination must be included in an overall view of the effects of the merger on mechanical metal plant building.

¹⁶² Reply to the Commission's request for information, submitted on 1 March 2005.

(b) VAI and SMS are particularly close competitors

(319) VAI and SMS are the closest competitors in the relevant market or markets. Because of this close competition between VAI and SMS, a customer who decides against VA Tech in a particular metallurgical project would very probably regard SMS as the next best alternative. This is shown, for example, by the ratings given by the competitors and customers questioned during the Commission's market investigation. VAI was regarded overwhelmingly as the leading and SMS as the second-strongest and next-ranking company in the following areas: pig iron making, steelmaking and continuous casting. SMS was regarded overwhelmingly as the strongest and VAI as the second-strongest and next-ranking company in the following areas: hot rolling, cold rolling, strip processing, pipemaking, aluminium cold rolling and aluminium hot rolling¹⁶³. In the case of copper and other metal plants, SMS was regarded as the market leader and VA Tech was considered one of the more important competitors. In only one area, the rolling of long products, was the third-largest supplier, Danieli, ranked first, while VAI and SMS followed in more or less equal second place).

(c) Insufficient competitive pressure is exerted by other competitors

(320) According to Siemens in its reply to the statement of objections, even if Siemens' minority holding in SMS were to result in a lessening of competition between SMS and VAI, there would continue to be intense competition in the relevant market. In Siemens' opinion, VA Tech and SMS would be faced with a number of other suppliers which from the customer's point of view constitute viable alternatives.

(321) The major suppliers mentioned in this connection by Siemens (MHI/Hitachi, JP Steel Plantech and Aker Kvaerner¹⁶⁴) are, however, rarely or never active in Europe and so do not represent a viable alternative for European customers. They are accordingly included by the customers and competitors surveyed only to a limited extent, and even then only in a few areas, among the five strongest suppliers in the mechanical metal plant building market as a whole or in one of the possible submarkets. As far as the smaller suppliers mentioned are concerned, contrary to the view taken by Siemens their capacity to bid successfully for major orders is called into question by many market participants (including by the smaller suppliers themselves). This also holds true for the possibility of forming consortia; according to market participants, these enable smaller suppliers to bid successfully only in a few cases, and then often only in conjunction with one of the larger suppliers.¹⁶⁵

(322) The Commission's market investigation showed, rather, that in the EEA the three full liners VAI, SMS and Danieli were almost exclusively mentioned as being the strongest competitors, accompanied, where appropriate, by smaller specialists such as Paul Wurth in iron and (partly) steelmaking and Andritz in cold rolling and strip processing. Worldwide, VAI, SMS, and Danieli were regarded in the context of the Commission's market investigation as by far the strongest competitors, accompanied by a few Japanese companies whose clear main focus is on orders in Japan and the

¹⁶³ In aluminium rolling VAI ranks more or less equally with Achenbach.

¹⁶⁴ "We are only active in the Americas market" (Aker Kvaerner, reply to the Commission's request for information on the metallurgy sector, Phase II)

¹⁶⁵ See answer to question 45 in the customer information request or question 19 in the competitor information request in Phase I.

Far East such as MHI¹⁶⁶, NSC, JP Steel Plantech and IHI and in the pig iron sector also by Chinese firms. [...] * Outside the three market leaders, then, competition is very fragmented and is not sufficiently capable of curbing the market power of the three leading suppliers.¹⁶⁷

(323) Danieli is usually regarded as the third strongest competitor, but on average well behind SMS and VAI. Danieli's strength lies primarily in flat rolling (section mills), where it is the market leader. Because of Danieli's market position and customer rating, it is unlikely to be able either to prevent competition from declining in the market for mechanical metal plant building as a whole or even to threaten the dominant position that VAI might gain as a result of Siemens/VAI's information advantage. This is also clear from the fact that, as is stressed by customers, the number of serious bids submitted to a customer is of decisive importance when it comes to the price the customer can achieve through negotiation. It was pointed out in the course of the Commission's market investigation that customers need at least three competitive bids in order to negotiate successfully in the field of metal plant building. This is also confirmed by what competitors have to say about the number of rival bidders in the final stages of contract award negotiations, which is often put at three.¹⁶⁸

(324) Siemens points out, lastly, that some customers and competitors expect within the next two to three years the market entry of viable suppliers from the Far East (Japan or China) in the EEA. This can be put into perspective by pointing out that many (if not most) market participants simply do not expect this to happen.¹⁶⁹ Moreover, the possibility of the market entry of such suppliers in the EEA is played down by the very market participants who in principle expect it to materialise. [*There follow comments on VA Tech's assessment of the market entry of Japanese and Chinese suppliers* ^{170 171}]* However, the market investigation did not turn up any further indications that this assumption can be made on the customers' side. Similar qualifications are also to be found in other statements by market participants.¹⁷² It should also be pointed out that, on a world measure, Far Eastern suppliers were ranked by customers far lower than the leading European suppliers. By and large,

¹⁶⁶ According to information supplied by VA Tech [reply to the request for information concerning metallurgy, Phase II (ranking of competitors)], which was confirmed in the course of the market investigation, MHI (the Japanese company mentioned most often by customers and competitors as being a relevant competitor) is active mainly in the possible submarkets of the mechanical building of hot and cold rolling plants and for belt installations and can therefore have no restricting effect on Siemens' market power in the entire possible market for mechanical plant building (and in particular in the submarkets for steelmaking plant and continuous casting plant).

¹⁶⁷ See also VAI's opinion, referred to in paragraph (227).

¹⁶⁸ To these must be added any further competitors who have already withdrawn. Particular mention should be made here of the multi-stage nature of the tender process, whereby there is some openness about the identity and the number of other tenderers.

¹⁶⁹ These include the [...] * competitor [...] * most often mentioned by customers and competitors.

¹⁷⁰ Reply to the Commission's request for information on the metallurgy sector, Phase II.

¹⁷¹ Reply to the Commission's request for information on the metallurgy sector, Phase II.

¹⁷² One Japanese supplier, for example, thus restricts the market entry possibilities of certain Japanese companies to specific process stage markets. The striking thing here is that the continuous casting market is not mentioned and the steelmaking market is mentioned only with reference to a single supplier. As regards Chinese suppliers, the market entry possibilities are restricted to non-ferrous metal plants. Another market participant understood the question in such a way that it also considered "VAI China", "Siemens China" and "ABB China" to be Asian suppliers.

therefore, these suppliers cannot be expected in the short term to be able effectively to curb the market power of the leading European suppliers, especially as far as customers in the EEA are concerned.

(d) Buyer power

- (325) Siemens took the view that, even on the assumption of competition restricted essentially to the three European full-liners and even in the event of a reduction in the number of equal-ranking suppliers competing head-on from three to two, there are no grounds for concern under merger control law, as in Europe the demand side is highly concentrated. Against this it can be objected that, as indicated in the statement of objections, although a concentration process is taking place in the metallurgical and rolling industries, the degree of concentration worldwide and also in Europe is still much lower than that, say, in the aluminium industry. The Commission's market investigation also showed that suppliers' customer structure is such that a large mechanical metal plant builder has a large number of customers accounting for the bulk of the firm's orders and is not therefore highly dependent on individual customers. Siemens' assertion that customers themselves create new suppliers or are able to turn individual smaller suppliers into general suppliers is unsubstantiated. Nor is such an assumption borne out by the findings of the market investigation.

(e) Substantial weakening of the competitive pressure exerted on Siemens/VAI by SMS

- (326) The merger would substantially weaken the competitive pressure currently exerted on VAI by SMS. It would give Siemens control of VA Tech in addition to its existing 28% holding in SMS. In view of the special circumstances of the case, it cannot be assumed with sufficient certainty that the 28% holding in SMS would, solely by reason of the financial participation in SMS's business success that this would normally entail, induce Siemens/VA Tech to compete less strongly with SMS (i). *[There follow comments on the corporate and organisational relationship between Siemens and SMS as regards the exchange of competitively sensitive information and its effect on bidding behaviour]**

(i) Insufficient certainty that the prospect of financial participation in SMS's business success would give Siemens less of an incentive to compete with SMS

- (327) The Siemens group's 28% holding in SMS might in principle from a financial point of view give Siemens/VA Tech less of an incentive to bid aggressively in those tender procedures in which SMS has a realistic prospect of winning the order. The (partial) internalising of competition between VA Tech and SMS would prompt Siemens/VA Tech (assuming maximisation of profits) to offer higher prices on average or grant lower discounts than are normal in the negotiating process, if SMS is a competitor with a good chance of success. For in the event of the contract being awarded to SMS Siemens would also participate financially through its 28% holding in this business success of SMS. [...] ¹⁷³*

- (328) In June 2004 Siemens, however, exercised with effect from 31 December 2004 a put option existing under the shareholder agreement to sell its 28% SMS holding to the

¹⁷³ [...]*

majority shareholder (SMS GmbH). The method of financial valuation of Siemens' 28% holding and hence the applicable purchase price is the subject of potentially lengthy litigation between Siemens and SMS GmbH.¹⁷⁴ Until the litigation has been settled and the sale is completed, Siemens retains ownership of the shares. The Commission's investigation showed that, according to concurring submissions by both parties in the action for determining the purchase price, the outcome will depend on the value of the share package as at 31 December 2004.¹⁷⁵ Siemens can therefore no longer proceed on the assumption that it will share in any future business success of SMS through a participation in the company's capital and possible future growth of its asset value. Although a financial participation through dividend payments does not appear to be ruled out, it is hard to predict especially in view of the pending litigation with the majority shareholder whether, and if so to what extent, such dividend payments will take place. Under the circumstances it cannot be assumed that Siemens would gear its competitive behaviour to any appreciable extent to a - for Siemens - uncertain participation in possible dividend payments. A competition-lessening effect from a financial point of view of Siemens' participation in SMS is therefore either non-existent or at most so slight that in itself it could not result in a significant impediment to effective competition.¹⁷⁶

(ii) Strengthening of the competitive position of Siemens/VA Tech through access to strategic knowledge about SMS's business policy

(329) *[There follow comments on the corporate and organisational relationship between Siemens and SMS as regards the exchange of competitively sensitive information]**

(330) *[There follow comments on the corporate and organisational relationship between Siemens and SMS as regards the exchange of competitively sensitive information]*¹⁷⁷*

(332) The flow of competition-related information is not stifled by actionable duties of confidentiality under German law (Article 116 of the Companies Law). While there is such a duty on the part of supervisory board members, [*There follow comments on the duties of confidentiality of the members of SMS's corporate bodies*]*

(333) [*There follow comments on possible effects of the minority holding on bidding behaviour*]*¹⁸⁷ Given Siemens' indefinitely continuing 28% share in SMS, the merger would thus substantially weaken competition between Siemens/VAI and SMS.

(f) Conclusion on the possible overall market for mechanical metal plant building in the area of iron and steel and on the overall market for mechanical metal plant building including ferrous and non-ferrous metals

(334) It is clear that, even if an overall market for mechanical metal plant building (either only in the iron and steel sector or also including non-ferrous metals) is taken into account, VAI, like SMS, already has pre-merger considerable market strength and that the two market leaders VAI and SMS are particularly close competitors.

(335) Post-merger, the competitive pressure that SMS has so far exerted on VAI would be largely lost as Siemens' access to strategic knowledge about SMS would enable Siemens/VAI to anticipate SMS's competitive behaviour and react accordingly. As outlined, there is also insufficiently strong competitive pressure from other companies to effectively restrict Siemens/VAI's competitive room for manoeuvre. Whether the information advantage over its strongest competitor SMS and its lead over Danieli in terms of market power would give Siemens/VAI a dominant position may be left open. At all events the merger would have a serious harmful impact on competition as a result of uncoordinated behaviour by firms. For these reasons there would be a significant impediment to effective competition in the overall market for mechanical metal plant building.

(3) Submarkets of mechanical metal plant building: creation of a dominant position

(336) The conclusion set out in paragraph (335) holds true even more forcefully for the possible process stage submarkets in mechanical plant building for steelmaking and continuous casting, to which the above considerations concerning market conditions, buyer power and the impact of Siemens' holding and rights in SMS also apply.¹⁸⁸ In the other possible submarkets in mechanical metal plant building, however, it is impossible to state with sufficient certainty that the merger would constitute a significant impediment to effective competition.

(337) In the possible market for mechanical plant building for steelmaking VAI was the firm rated highest overall by competitors and customers in the Commission's market investigation. In second place, just behind, was SMS. The assessment of its own market leadership is shared by VAI in public pronouncements.¹⁸⁹ VAI and SMS

¹⁸⁷ [...]*

¹⁸⁸ See considerations in paragraphs (306)-(311), (325) and (326)-(333).

¹⁸⁹ See VAI's 2004 annual report in VA Tech 2004 Business Report (http://www.vatech.at/truman/up-media/2933_VAI_AR_2004_E.pdf). All statements refer to 2004: "[VAI] was able to further develop its world leadership position in the Steelmaking [...] technologies, especially in stainless steel technology"; "In electric steelmaking VAI Fuchs was able to attain worldwide

have high EEA and world market shares in a concentrated market. VAI and SMS each have estimated world market shares of between around 30–40%; their EEA market shares are very probably even higher. These high market shares suggest that the market is already highly concentrated, which makes a significant negative impact on customers more likely. This is especially true given the close competition between the two strongest players, which would diminish as a result of the merger in favour of the leading firm. VAI and SMS are the closest competitors. Danieli lies well behind in third place and is not in such close competition. The remaining competition is fragmented. Smaller suppliers cannot compete with the big players in major projects or else they rely on cooperation with the big suppliers or specialise in specific market niches.¹⁹⁰

(338) In the possible market for mechanical plant building for continuous casting VAI is clearly rated by customers and competitors alike as the market leader both in the EEA and worldwide. VAI very probably has market shares of over [40-50]*% in the EEA and worldwide.¹⁹¹ SMS ranks second and is VAI's closest competitor. Danieli is well behind in third place, its competitive strength lying elsewhere (the continuous casting of long products). In the areas of slab casting, thin slab casting and the new process of thin strip casting, VAI and SMS are particularly close competitors. Competition is fragmented and is not sufficiently capable of curbing VAI's market power.

(339) For these reasons Siemens would gain a dominant position in the possible markets for mechanical plant building for steel production and mechanical plant building for continuous casting, resulting in a significant impediment to effective competition. At all events the merger would have, in these possible markets also, a serious harmful impact on competition as a result of uncoordinated behaviour by firms.

(4) Examination of possible non-horizontal effects

(340) The notified merger would result in the integration of suppliers of, on the one hand, electrical (Siemens, VAI) and, on the other hand, mechanical (VAI) plant. It must therefore be examined whether this would have any anticompetitive effects for mechanical (or electrical¹⁹²) metal plant building.

(341) This question must be answered, at this point first of all with respect to mechanical metal plant building, in the negative. Even if VAI has until now had to buy in certain electrical metal plant building services (e.g. in the area of traction solutions or of level 0 electricity supply),¹⁹³ it cannot be concluded from this that the future probable intra-group supplying of VAI by Siemens would lead to an appreciable

market leadership". NB: here, electric steelmaking refers, not to electrical metal plant building, but to a subsector of mechanical metal plant building in the steelmaking process stage.

¹⁹⁰ See also paragraphs (320)-(324) above. It is also worth noting that in steelmaking Paul Wurth was ranked as one of the five strongest firms by far fewer market participants than in pig iron making.

¹⁹¹ See also paragraphs (320)-(324) above. On VAI's views regarding its market position in slab casting, see above, footnote 158. In VAI's 2004 annual report this is confirmed and even reinforced. "[F]urther extension of our market leadership for new slabcasters [and] caster modernisations" (See http://www.vatech.at/truman/up-media/2933_VAI_AR_2004_E.pdf)

¹⁹² See paragraphs (397)-(400) below.

¹⁹³ To some extent, however, supply possibilities already existed within the VA Tech group through Elin EBG.

strengthening of Siemens/VAI in the mechanical metal plant building sector. First, it is entirely possible that customers might consider being tied to Siemens for the supply of, say, drives to be a disadvantage and hence prefer suppliers (such as SMS or Danieli) who are independent in this respect.¹⁹⁴ Secondly, there would continue to be a large number of separate tender procedures (and contract awards) for electrical and mechanical plant building on which this possibly strengthened link between electrical and mechanical plant building would have no impact and in which a mechanical plant builder would be entirely competitive even without any link-up with an electrical plant builder. Thirdly, other, originally primary mechanical suppliers (such as, for example, Danieli, MHI, Achenbach and Andritz) would remain free to forge closer ties with traditionally electrical suppliers. This would be all the more easy as, when performing simultaneous contracts for the mechanical and the electrical parts of a plant (as is typically the case with new plants), the mechanical supplier has traditionally assumed a certain leadership or general contractor role in relation to the electrical metal plant supplier.

(5) *Summing-up on mechanical metal plant building*

(342) The notified merger would accordingly result in a significant impediment to effective competition due to anticompetitive effects stemming from uncoordinated behaviour by firms and possibly also from the establishment of a dominant position on the part of Siemens/VAI, both in the EEA and worldwide, in the market for mechanical metal plant building (whether limited to iron/steel or extended also to non-ferrous metals) and its possible submarkets for steelmaking plants and continuous casting plants.¹⁹⁵

(b) *Electrical metal plant building*

(1) *Market for electrical metal plant building (level 0-2, iron/steel), possible process area and process stage submarkets*

(i) *Market structure and market shares*

- *Market position of the parties and competitors*

(343) According to Siemens' view as expressed in the merger notification (Form CO), Siemens' main competitors in the market for *electrical metal plant building* are ABB, Alstom and TMEIC-GE. This view was confirmed by the Commission's market investigation, where those firms were mentioned as being important competitors, although TMEIC-GE is active mainly outside Europe. Other important competitors are the former mechanical plant building specialists VAI, SMS and Danieli. [...] ¹⁹⁶

(344) [...] ¹⁹⁷ [...] ¹⁹⁸ [...] ¹⁹⁹

¹⁹⁴ VAI's independence or openness vis-à-vis electrical subcontractors used to be regarded as one of its competitive strengths.

¹⁹⁵ On the commitments submitted by Siemens to remove these effects and their assessment by the Commission, see paragraphs (489) and (491) and paragraphs (493)-(496).

¹⁹⁶ Reply to the request for information of 29 March 2005, Annex 1.b, sheet 11.

¹⁹⁸ Reply to the request for information of 29 March 2005, Annex 1.a, sheet 37.

(345) [...] *²⁰⁰

(346) The Commission's market investigation has shown that Siemens is seen by many market participants (customers and competitors) as the most important and best-known supplier of electrical metal plant building in the iron/steel sector in the EEA and worldwide. This is true for the possible overall market and in most of the submarkets, except in the possible long-rolling submarket, where Danieli is seen as the leader. In all these areas VAI is regarded as a strong competitor, usually in second place in the market; and in the field of continuous casting it is even regarded as roughly on a par with Siemens.²⁰¹ It should be borne in mind, however, that the customers surveyed were predominantly (European) customers of VAI and Siemens who might tend to rate the importance of VAI and Siemens more highly.

(347) It is significant in this connection that, besides the parties, other competitors were mentioned by competitors and customers as being strong suppliers. In the liquid phase process area, these are above all ABB and Alstom; in the ironmaking process stage Corus and Posco as well,²⁰² and in the steelmaking process stage SMS and Danieli as well. In the hot phase process area, ABB, SMS, Alstom, Danieli, and in the hot rolling process stage Toshiba (or TMEIC-GE) (which, however, has so far won only a few orders in Europe) as well, were mentioned.²⁰³ These firms, together with Sundwig-Andritz, were also regarded as strong suppliers in the cold-rolling process area. A few other competitors also received a mention (e.g. Ingelectric and ASI Robicon).²⁰⁴

(348) In the light of these data from customers and competitors it must therefore be concluded that, in the electrical metal plant building market (iron/steel, level 0-2) and in its possible submarkets categorised by process area and process stage, the present merger is a merger between important, possibly even leading, suppliers, but that, both in the possible market for electrical metal plant building (level 0-2, iron/steel) and in all submarkets, a substantial number of at least four other credible suppliers, including SMS, are active.

- Market shares in the overall market and in process area or process stage submarkets

(349) Market shares are rather difficult to quantify objectively in this very varied and differentiated product or service area. The Commission has several estimates from Siemens, some produced for the purpose of the proceedings and others produced well before they started. The Commission also has estimates drawn up by VA Tech before the proceedings began as well as estimates drawn up during the proceedings at the Commission's request. Finally, estimates drawn up by SMS for the purposes of the proceedings were also submitted to the Commission. The estimates give quite a wide range of figures for market shares. Siemens' estimates (apart from a few process stage estimates in internal documents) generally assume combined market shares of less than [15-20]*%, whereas VAI's estimates are considerably higher, somewhere in the region of 40–50%. The highest figures, albeit not for the overall

¹⁹⁹ Reply to the request for information of 29 March 2005, Annex 1.b, sheet 13.

²⁰³ Other competitors were mentioned, including Reliance, Hitachi, Gefeba and ASI Robicon.

²⁰⁴ Results of the market investigation, assessment of the questionnaires on phase II.

market but only for 3 possible process stage markets (continuous casting, hot rolling and cold rolling), appear in SMS's (60 – approx. 70%).

(350) Although in the view of the Commission (and of some of the competitors mentioned)²⁰⁵ none of these estimates can be regarded as very reliable, they are examined briefly below. This is followed by a calculation of actual market shares produced by the Commission.

(ii) *Market share estimates from Siemens, VAI and SMS*

(351) In Siemens' view the parties' combined market share in the overall EEA market for *electrical metal plant building* in 2003 came to [5-10]*% (Siemens [2-5]*%, VA Tech [2-5]*%).²⁰⁶

(352) During the Commission's in-depth examination Siemens also estimated the combined market shares by process stage to be low. In the iron/steel sector VAI's worldwide market shares were put at [0-5]*% (2000-2004), while Siemens estimated its own market shares at predominantly less than [5-10]*%, with the exception, however, of hot rolling ([10-25]*%) and cold rolling ([5-15]*%). In this estimate, EEA market shares for VAI were the same or slightly higher and for Siemens even lower.²⁰⁷ With regard to the liquid phase, Siemens later submitted other estimates which gave Siemens' average market share for 2002-2004 in the EEA as [5-10]*% and VAI's as [10-15]*% or [10-15]*%.²⁰⁸ Siemens also submitted a market share calculation for the EEA carried out by an economic consulting firm, which reaches the conclusion in a scenario described as conservative that the parties' combined market share in an overall electrical market in the EEA comes to no more than [10-15]*%. The study suffers from certain shortcomings, however, and cannot therefore be regarded as providing a sufficiently reliable market share estimate.²⁰⁹

(353) [...] ²¹⁰ [...] ²¹¹

(354) In its business plan for 2002-04, VAI estimated its market position in electrical metal plant building overall at [10-15]*% and that of Siemens, which VAI considered to be the market leader, at [20-30]*%. In western Europe, Siemens' market share came according to these data to [30-40]*% and that of VAI to [15-20]*%. The relevant world market volume came in VAI's opinion to EUR [...] * million (i.e. much less than Siemens assumes).²¹² VAI saw itself in this estimate as more or less on a par with ABB. Other firms lagged well behind: Alstom: [10-15]*%, SMS Demag: [2-5]*%, Danieli: [2-5]*%.²¹³ A later market share estimate for the years 2001-03 submitted by VAI puts

²⁰⁵ See below VAI's qualification regarding the validity of its own market estimates.

²⁰⁶ GE and TMEIC have set up a joint venture in the electrical metal plant building sector and are therefore no longer to be regarded as independent competitors.

²¹³ [...] *.

Siemens' worldwide market share at [20-30]*% and VAI's at [15-20]*%. The market shares of competitors (SMS Demag, Alstom, ABB, Danieli) ranged between [5-10]*% and [5-10]*%. The corresponding market shares for Europe in this estimate were: Siemens: [20-30]*%, VAI: [10-20]*%, Alstom, SMS, ABB: [5-10]*%.²¹⁴ A further market share estimate by VA Tech relating to iron- and steelmaking, including continuous casting, for the period 2001-03 for Europe gave VAI: [20-30]*%; Siemens: [20-30]*%; Alstom: [5-10]*%; SMS Demag: [10-15]*%; ABB: [5-10]*%.²¹⁵ VA Tech itself reduced the significance of its market share estimates, however, when it stressed that they represented only the subjective, limited view of a firm active mainly in the mechanical plant building sector whose market view did not encompass the whole market. The Commission shares this opinion.

(355) SMS provided the following estimate of EEA market shares for *electrical metal plant building as a whole*: Siemens: [30-40]*%, VAI: [10-15]*%, SMS: [5-10]*%.²¹⁶ SMS estimated the combined market shares of Siemens and VAI in the process stage submarkets studied somewhat higher still. When asked to substantiate these estimates, SMS submitted an assessment of the largest worldwide projects in the market during the last 4 years worth more than EUR 5 million on the assumption that market shares in the actual market behaved in the same way as in this, the largest project segment. This gave a combined Siemens/VA Tech market share of [60-70]*% for continuous casting ([5-10]*% + [50-70]*%), [70-80]*% ([60-70]*% + [5-10]*%) for hot rolling and [60-80]*% ([50-60]*% + [10-15]*%) for cold rolling.²¹⁷ For SMS itself, it resulted in market shares of [20-30]*% (continuous casting) and [5-10]*% each for hot rolling and cold rolling. For other process stages, SMS did not submit any substantiated estimate.²¹⁸ Siemens criticised SMS's estimates as being too high and argued that, even in SMS's view, the limitation to projects worth more than 5 million resulted in only 40-60% of the market being covered, which Siemens moreover doubted as the number of projects taken into account by SMS annually was far too small. This was due to the fact that, as a firm active mainly in the mechanical plant building sector, SMS necessarily had a limited view of the electrical metal plant building market. SMS had thus failed to include a substantial number of major projects in the basis for its assessment.²¹⁹ Siemens' criticism is justified above all with regard to the leaving out of account of projects in SMS's project lists. Inasmuch as SMS's market share in electrical metal plant building is far smaller than in mechanical metal plant building, this omission might, as Siemens maintains, quite rightly be put down to SMS's limited market view as a firm primarily active in the past in mechanical metal plant building. SMS's estimate is therefore to be regarded as no more than the subjective market view of an important market player.

(iii) *The Commission's market share calculation*

(356) In view of the above-mentioned weaknesses in all of the above market share estimates and calculations and in view of their considerable divergences, the Commission carried

²¹⁴ Reply to the request for information of 14.1.2005, question 18.

²¹⁵ Reply to the Commission's request for information of 18.1.2005, question 16.

²¹⁶ SMS, non-confidential version of 9.2.2005.

²¹⁷ SMS, reply to the request for information of 21.2.2005, made non-confidential on 21.4.2005.

²¹⁸ SMS's overall market estimate can therefore also be regarded as unsubstantiated.

²¹⁹ Siemens thus points out that the project list submitted by Siemens both for hot and for cold rolling contains more than 20 projects with an order value that is greater than the smallest project in the SMS list.

out an analysis of the strength of the major competitors in the main part of the markets referred to above, i.e. for orders worth more than EUR [0.5-3]* million, for the years 2002-2004. It asked competitors about all the orders they had won during the relevant period and aggregated the figures.²²⁰ The results of the inquiry therefore reflect only the relative size of the firms questioned, but, due regard being had to this fact, they constitute the best information available in the present case.

(357) At a late stage in the proceedings, in connection with the liquid phase Siemens provided information on other competitors which had won specific orders in the EEA during the period in question and which had not been included in the Commission's original calculation. The Commission checked the information and took it into account where it was confirmed by the customers and/or competitors concerned.

(358) In the Commission's view, this calculation represents a meaningful approximation of actual market shares. Admittedly, it ignores that area of the market which includes orders worth less than EUR 1 million. However, the importance of that area when it comes to establishing the actual market strength of firms in the overall market is reckoned to be relatively minor inasmuch as firms that are competitive only or chiefly in the area of small orders may be regarded by customers as being not fully competitive. A more important qualification is that account has to be taken of the possibility, not to say the probability, that suppliers not represented in the table may also have won orders in the area and period in question.²²¹ For this reason, the market shares indicated must be regarded as the upper limit and the actual market shares are very probably somewhat lower.²²²

Order value > 1 million '02-'04	<i>Total worldwide</i>	<i>Liquid phase worldwide</i>	<i>Liquid phase EEA</i>	<i>Hot phase worldwide</i>	<i>Cold phase worldwide</i>
Siemens	<25%	<20%	<15%	<25%	<30%
VAI	<20%	<30%	<30%	<20%	<15%
Parties	35-40%	40-45%	35-40%	35-40%	35-40%
SMS	<10%	<10%	<10%	<10%	<10%
Danieli	<15%	<20%	<5%	<15%	<10%
ABB	<20%	<10%	<5%	<20%	<20%
Alstom	<15%	<5%	<5%	<10%	<20%

²²⁰ In two cases, instead of the sum of the projects, annual turnover figures for projects worth more than EUR 1 million were used.

²²¹ Suppliers are involved who either were not mentioned in time to the Commission by Siemens as being competitors and so could not be contacted or who were unable to provide the required information in good time.

²²² It must also be taken into account here that in the case of one supplier, Danieli, it was not possible to clearly allocate certain order volumes to individual process stages or process areas, which in Danieli's case resulted in a certain amount of double counting and hence higher market shares. It is much more likely, however, that the volume increase due to the inclusion of disregarded competitors far exceeds any volume decrease due to a corresponding correction of Danieli's order volumes.

Ingelectric	<5%	<5%	<5%	<5%	<5%
TMEIC-GE	<15%	<5%	0%	<15%	<15%
Other EEA competitors for liquid phase ²²³	<5%	<20%	<50%	--	--

Order value > 1 million '02-'04, worldwide	Continuous casting	Hot rolling flat	Cold rolling flat	Strip plant
Siemens	<10%	<30%	<30%	<25%
VAI	<40%	<15%	<15%	<20%
Parties	40-45%	35-40%	35-40%	35-40%
SMS	<20%	<5%	<10%	<10%
Danieli	<35%	<10%	<10%	<15%
ABB	<5%	<25%	<20%	<15%
Alstom	<5%	<15%	<20%	<25%
Ingelectric	<5%	0%	0%	<10%
TMEIC-GE	<5%	<20%	<15%	<10%

(359) These tables show that, as a result of the merger, very probably (given the presumably larger market volume in real terms) no market shares will be more than [30-40]*%. This also applies to the possible worldwide market for the liquid phase, since it is unlikely that, worldwide, there would be higher market shares for Siemens and VAI than in the EEA and Siemens' view that also other competitors not shown in the tables are active worldwide is to this extent credible.²²⁴ In the possible worldwide market for continuous casting too, this should be assumed for the same reasons. In every process area and every process stage there will be at least four efficient suppliers left in the market, which may be expected to exert sufficiently strong competitive pressure on the merged undertaking. Basically, these competitors also include SMS. Not represented in the tables is the special area of long rolling, where, however, on account of Danieli's clear market leadership there are no concerns either.

²²³ These are those competitors with respect to whom Siemens on 29.5.2005 mentioned specific projects worth more than EUR 1 million in the liquid phase which the Commission was able to verify.

²²⁴ The somewhat higher market share in the possible worldwide market is explained by the fact that as regards other competitors for the liquid phase Siemens has concentrated on EEA projects because they are easier to check for the Commission and because of their greater relevance for competition purposes.

(360) It should be added that, with the exception of TMEIC-GE, the competitors represented in the table are European competitors, for which as suppliers of European customers there can be no special entry thresholds. In fact, the EEA market shares not shown in the tables also change in roughly the same order of magnitude as the world market shares shown.

(361) Even excluding the internal Japanese sales of TMEIC-GE, given the assumption of a world market without Japan,²²⁵ results in market shares that either do not increase the worldwide joint market share spreads of the parties contained in the above tables, which as mentioned should otherwise be interpreted as upper limits, or only exceed them very slightly by 1-2%. The conclusion that there would very probably be no market shares of more than [30-40]*% therefore applies as well to the assumption of a geographically reduced “accessible” world market. In each of the possible markets mentioned, TMEIC-GE, even on this premise, remains a substantial competitor, so that, from this standpoint too, there is no fundamental change in the competition analysis.

- Tendering analysis for the overall market (iron and steel, levels 0-2) and the process area and process stage submarkets

(362) The markets in question are of course tendering markets, where market shares only have an indicative function. The decisive factor is the strength of the competitive pressure which undertakings exert on each other as bidders, although long-term market shares act as an important indicator of that strength. As already emphasised in the analysis of mechanical metal plant building, after the bid submission and opening phases there is usually an intensive negotiating phase where it is possible for bidders to grant price discounts. It is also possible to adapt parts of the order qualitatively to customers’ wishes or, for customers, to change the scope of the order.

(363) The Commission has analysed the tendering data of some competitors in these markets. The analysis of Siemens’ tendering data revealed that, with regard to the overall market (iron and steel, levels 0-2) for electrical metal plant building, worldwide 3 other undertakings²²⁶ and EEA-wide 2 other suppliers in electrical metal plant building competed with Siemens more frequently than VAI. There was a similar result in terms of its trend with hot rolling, cold rolling and strip processing lines. Analysis of VAI’s tendering data confirmed, both for the overall market and for the process areas and stages mentioned, that Siemens is not VAI’s closest competitor in them.²²⁷

(364) In the case of continuous casting plants,²²⁸ VAI, according to the analysis of Siemens’ tendering data, was worldwide just behind another firm, and EEA-wide was in first place. However, analysis of VAI’s tendering data showed that Siemens’

²²⁵ The scenario which excludes an inaccessible part of the Chinese market has, however, no effect on the above calculation, since this part would be equally inaccessible for all the suppliers shown in the table.

²²⁶ This finding applies both to a world market which includes Japan and to one which excludes it. The inclusion/exclusion of a part of Chinese demand (which continues to be reserved for Chinese suppliers) has no effect on this finding.

²²⁷ This would probably be because the area of level 0 automation (electrics and drives) in the cold and hot rolling phase (and proportionately in the overall market as well) is the traditional domain of electrical engineering firms such as Siemens, ABB, and Alstom, while the “mechanical engineers” in this area have advanced only slowly, as they do not manufacture electrics and drives themselves.

²²⁸ The number of such bids was admittedly small.

significance as a competitor of VAI in continuous casting is relatively small, and that SMS and Danieli are the most important competitors for VAI in this process stage. Since it is clear from the analysis of market shares that VAI is the strongest competitor with the highest market share in continuous casting, greater importance should be attached to its tendering data. From this information it follows, therefore, that in the hot phase and cold phase process area markets too Siemens and VAI are not the closest competitors.

- (365) An exact analysis of the tendering data in the case of long-rolling plants is not necessary as Danieli is the leader in this submarket.
- (366) In the process area market for iron and steel plants (liquid phase), Siemens competed, according to its own tendering data, in the EEA and worldwide most frequently with VAI, and worldwide equally with ABB. An expert's report commissioned by Siemens shows that the difference between VAI and the second or equally placed firm, ABB, is not statistically significant and therefore both firms can rank as equally close competitors of Siemens. Analysis of VAI's tendering data showed however that, in the iron and steel production area, SMS was the clearest competitor of VAI, and Siemens only one of two other important competitors. Here too it should be noted that greater importance must be attached to the tendering data of VAI in view of that company's probably higher market share.
- (367) The tendering data show, therefore, that Siemens and VAI can at best be regarded as close competitors in individual possible submarkets (continuous casting, liquid phase). Even in these few submarkets, however, they are not each other's closest competitors.

- Effect of the Siemens shareholding on SMS

- (368) In the assessment of Siemens' competitive position in the market under consideration and its possible submarkets, it should also be borne in mind that, through its minority shareholding in SMS, Siemens has access to the strategic knowledge of this competitor. For the same reasons as discussed for the area of mechanical metal plant building (see paragraphs (326)-(333)), the competitive pressure on Siemens exerted by SMS could be weakened therefore.
- (369) Unlike in the field of mechanical metal plant building, however, such reduced competitive pressure in the relation between Siemens and SMS would not be created only by the merger but would affect competition even without the merger, because Siemens is already operating in the field of electrical metal plant building.²²⁹ Also, Siemens and VAI are not closest competitors in electrical metal plant building, unlike SMS and VAI in mechanical metal plant building.
- (370) In any event, the commitments concerning its shareholding and [...] shareholder's rights in SMS given by Siemens, which are necessary for removing the competition concerns in the field of mechanical metal plant building, provide the solution to Siemens/VA Tech's link to SMS from the competition angle for electrical metal plant building too. In electrical metal plant building too, therefore, it can be ruled out

²²⁹ Thus it is quite possible that the link hitherto to Siemens has delayed SMS's entry into electrical metal plant building. At any rate, according to the results of the market investigation, SMS is clearly behind VAI in electrical metal plant building and entered the sector significantly later.

that this shareholding and the [...] information rights associated with it will significantly impede competition as a result of the merger between Siemens and VA Tech. The de facto dissolution of the link between Siemens and SMS has the positive effect, moreover, of intensifying competition between Siemens and SMS.

- *Conclusions*

(371) An overall assessment of the information concerning the competitors, the structure of the market and, in particular, the bidding data, which also took account of Siemens' minority holding in the competitor SMS, reveals that the merger will not create a dominant position in the abovementioned market or markets of electrical metal plant building (level 0-2, iron/steel) or significantly impede effective competition in any other way.

(2) Possible markets for level-1 and level-2 automation

(372) The market investigation confirmed that competitors consider level-1 and level-2 software solutions relevant indicators of market strength.²³⁰

(373) [...] [VAI] [...] [sees] [...] [itself] in a technological leadership role in such possible automation markets.²³¹

(374) However, it is still true to say that enough viable competitors will remain even in these possible markets. SMS followed VAI in developing automation technology for metal plant building, somewhat late but with a clear strategy and rapid growth.²³² The third leading company in mechanical plant building is still Danieli, a company that has also greatly expanded its automation activities and is a major supplier of level-1 and level-2 automation technology. The Commission has information regarding the technological performance of and/or research being conducted by Alstom,²³³ ABB and TMEIC-GE.²³⁴ There are also a number of other suppliers also competing with the merger parties, particularly in level-1 markets, where the barriers to entry are lower than in level-2 markets, or which offer niche solutions.

(375) When conducting its market investigation the Commission asked the parties and competitors for their reference figures for various software modules of process models and technical control systems for three process stages (continuous casting, hot rolling and cold rolling). Nine firms replied, namely Toshiba-TMEIC-GE, Andritz, Danieli, SMS, Siemens, VAI, Ingelectric, ABB, and Mino. As solution bundles are used for each process stage and it is in part the customer who decides whether a particular individual solution is needed or not, figures regarding specific solutions are less relevant than those covering a solution bundle for a specific process stage. For this reason, the Commission aggregated the figures to 6-8 single

²³⁰ [...].*

²³¹ [...] VAI also sees itself as “the leading supplier of advanced automation solutions for the international iron and steel and aluminium industries” (VAI homepage, brochure) [...].*

²³² Turnover in electrics and automation (order entry planning) 2002:35 mn, 2003:60mn; 2004:74 mn; 2005: 93 mn; 2006:100mn. [...].*

²³³ [...] (Reply to request for information of 29 March 2005, Annex 1.1, sheet 12. [...].*

²³⁴ [...].*

modules for each process stage to produce an overall figure for the stage. As no figures were obtained from a number of relevant competitors, at least one of which is certainly a major supplier (Alstom), the percentages must be seen as *absolute upper limits*. *The actual market shares are sure to be lower.*

Level-1 and level-2 software modules; plant equipment, worldwide	Siemens	VAI	Siemens +VAI	Competitor 1	Competitor 2	Competitor 3
Continuous casting	5-10%	35-40%	45-50%	25-30%	15-20%	5-10%
Hot rolling	15-20%	25-30%	45-50%	25-30%	20-25%	5-10%
Cold rolling	30-35%	15-20%	45-50%	15-20%	15-20%	5-10%

(376) The figures in the table tally with the other findings of the market investigation, showing that while after the merger the parties would become the market leaders in the possible level-1 and level-2 automation markets for the process stages in question there would still be a sufficient number of technologically viable competitors in the market.

(377) This also applies to possible markets for automation solutions (levels 1 and 2) in the process stages not covered by the table, and therefore automatically in the overlying process areas, and finally in a possible total market for level-1 and level-2 automation solutions for the iron and steel industry. The market investigation findings show certain similarities between automation solutions for strip processing and cold rolling. This is also true of the competitive conditions, about which no specific concerns were expressed in the market investigation. With regard to automation solutions for iron and steel production, Siemens produced information pointing in the same direction and confirming the existence of a sufficient number of other competitors.²³⁵ The investigation suggested that automation solutions for the special field of long rolling were less useful. Moreover, Danieli is the market leader in this field, which is why there are generally no competition concerns in this specific area.

(378) Comments from customers to the effect that the merger would have the greatest impact on the automation field, and level 2 in particular, but that there would still be a sufficient number of competitors at the same technological level, confirm these findings. No key technologies could be identified that would enable the merger parties to prevent competitors from being successful in the market.

(379) As regards the impact of Siemens' holding in SMS, what was said in relation to electrical metal plant building (levels 0-2; iron/steel) applies (see paragraphs (368)-(370) above).

²³⁵ [...] * statements were corroborated by other market participants.

(380) For these reasons in none of the possible level-1 and level-2 automation markets in iron and steel plant building is a dominant market position created or effective competition restricted appreciably in any other way.

(3) *Electrical plant building for aluminium hot and cold rolling*

(381) Siemens does not believe that there is a relevant separate market for electrical plant building for aluminium hot and cold rolling, and the product market definition left this question open. The Commission's market investigation showed clearly that, in comparison to steel rolling, these possible markets would be very small (in all likelihood accounting for less than 10% of the turnover of electrical steel rolling mill building). This alone means that the existence of combined markets for rolled steel and aluminium could not significantly influence the completed analysis of rolled steel markets. As will be shown, this follows as there are no competition problems on possible aluminium markets. The same argument applies to any possible total market for electrical plant building that would include aluminium rolling mills.

(382) [*There follow comments on Siemens' internal assessment of the field of aluminium rolling*]*. However, the Commission's market investigation revealed that a number of competitors and customers viewed Siemens as the strongest supplier of electrical plant building for both aluminium hot rolling and aluminium cold rolling.²³⁶

(383) VAI says that ABB and TMEIC are significant suppliers of aluminium hot rolling plants.²³⁷ It adds that there are also other, smaller suppliers (Alstom, ASI Robicon, IAS).

(384) VAI is of the view that ABB and Alstom are significant suppliers of aluminium cold rolling plants. For new plant, the mechanical suppliers (Achenbach, Fata Hunter, SMS) apparently used their own automation systems. Although a smaller supplier, IAS is becoming more active in the market. In terms of technical control systems for aluminium foil rolling mills VAI sees itself as the market leader but considers that there a number of serious competitors, most notably ABB.

(385) According to VAI, the building of aluminium hot rolling mills is quite a small market.²³⁸ [...] ²³⁹ In its public statements VAI sees itself as the world leader in the modernisation and automation of aluminium rolling mills.²⁴⁰

(386) The majority of customers do not think that the merger will cause any problems in the area of electrical plant building of aluminium hot and cold rolling mills. While both parties are often named as leading suppliers, a number of other companies have won tenders.

²³⁶ Results of the market survey, assessment of the phase II questionnaires.

²³⁷ VAT Tech's reply to the Commission's request for information of 29 March 2005 (received on 6 April 2005).

²³⁸ Other statements regarding sales in this field confirmed that in comparison to the steel rolling mills markets electric aluminium rolling mills markets are relatively small.

²³⁹ VAI Tech's reply to the Commission's request for information of 29 March 2005 (received on 6 April 2005).

²⁴⁰ "VAI is the world leader in the Modernisation and *Automation* of Aluminium Rolling Mills", VAI refers to special control systems; 28 hot rolling plants; 58 cold rolling plants; 72 foil rolling plants in 10 years (homepage, brochures).

- (387) Even if there are barriers to entry in the area of aluminium, these are, however, considerably smaller for two groups of suppliers, namely, on the one hand, specialist or non-specialist suppliers of mechanical aluminium plants, such as Fata Hunter, Achenbach, Mino (as smaller suppliers, it could, however, be easier for these companies to tender for smaller plants) and SMS, which is also able to undertake larger projects; and, on the other hand, companies that are already supplying level-1 and level-2 automation to the steel industry (above all for hot and cold rolling).
- (388) There are no competition concerns with regard to aluminium cold rolling and foil rolling mills, as there are enough competitors in this market, and plants are often smaller.
- (389) In the case of aluminium hot rolling mills the thresholds to entry are higher and are mainly in the area of technological control systems and process models (i.e. possible level-1 and level-2 submarkets). Smaller suppliers seem to have problems overcoming these technological and size-related barriers, although they are named by some potential customs as possible alternatives. However, they can meet the requirements for supplies in the field of aluminium hot rolling with support from the highly concentrated demand side, which most definitely has some buyer power.
- (390) The main source of competition to the merger parties are the major electrical suppliers in the steel sector, such as TMEIC, ABB and Alstom. All these suppliers have experience in aluminium. As yet not all necessarily have sophisticated special level-2 process models. In the case of TMEIC it should also be borne in mind that the company has rarely tendered successfully in Europe. Moreover, however, there are a number of companies that have been named as possible market entrants and have been found to be plausible or appear to have already set about entering the market. The companies in question are SMS, Achenbach and IAS. As IAS and Achenbach are relatively small companies, of the three SMS seems to have the best chance. With active support from a major customer SMS is likely to be in a position to enter the market successfully within a relatively short time.
- (391) As regards the impact of Siemens' holding in SMS, what was said in relation to electrical metal plant building (levels 0-2; iron/steel) applies (see paragraphs (368)-(370) above).
- (392) For these reasons in neither of the aluminium plant building markets affected will the proposed merger create or strengthen a dominant market position or significantly impede effective competition in any other way.

(4) IT solutions for plant logistics/MES/Level 3

- (393) In this relatively young and highly dynamic sector the proposed merger does not give rise to any competition concerns. It should be remembered that the sector is relatively small, accounting for no more than [5-10]*% of the total market volume for electrical metal plant building,²⁴¹ and that therefore the inclusion or exclusion of this sector cannot make much difference to any assessment of the total market for electrical metal plant building. It follows, however, that there are no competition concerns in a total market for electrical metal plant building only in the light of the

²⁴¹ [...]*

fact that there are no competition concerns in the possible segment (or possible separate market) for IT solutions for plant logistics /MES/Level 3.

(394) While both Siemens and VA Tech offer solutions on this possible product market, they are at a relatively early phase of development. When surveyed by the Commission, market participants expressed no concerns whatsoever regarding such a market. There are currently few obstacles to entry into this market and, given the predicted growth of the market, there are clear incentives for competitors to invest. There are enough current and potential competitors, as the merger parties' competitors are also working on such solutions in other markets for electrical metal plant building and moreover the market is also accessible to companies offering general control technology and logistics solutions.

(395) For these reasons the proposed merger will not significantly impede effective competition in a possible market for IT solutions, in particular as a result of the creation or strengthening of a dominant position.

(5) Conclusion regarding a possible total market for electrical metal plant building including all the abovementioned sub-markets

(396) As no competition concerns could be detected in any of the possible sub-markets of an overall market for electrical metal plant building, the same necessarily holds true for a possible overall market, and in such a market the merger would neither create nor strengthen a dominant position or significantly impede effective competition in any other way.

(6) Additional assessment of possible non-horizontal effects

(397) The proposed merger will lead to the integration of supplies of electrical plant building (Siemens, VAI) and mechanical plant building (VAI). An assessment must therefore be made as to whether this will have the effect of restricting competition in the electrical metal plant building sector.

(398) The answer must be negative. Even if VAI has until now acted as a principal for other companies in the electrical metal plant building sector (e.g. in connection with drive solutions or level-0 electricity generation), it does not follow that VAI's subcontractors, as independent suppliers, will leave the market for electrical plant building because subcontracts are switched to Siemens. There will continue to be a large number of separate calls for and awards of tenders for electrical and mechanical plant building and orders concerning only the electrics of a plant. An electrical plant builder with no links with any mechanical plant builder is fully competitive in this field. Secondly, the loosening and certain ending of the ties between Siemens and SMS increase the likelihood that SMS will try to obtain supplies from electrical subcontractors other than Siemens. Thirdly, other primarily mechanical suppliers (such as Danieli, MHI, Achenbach and Andritz) will continue to be potential customers in the market. Fourthly, other competitors could attempt to become general contractors for both mechanical and electrical orders, as Siemens has done with initial success.

(399) The merger cannot create a market lock-in or any other foreclosure effects in electrical metal plant building or between electrical metal plant building and markets upstream or downstream. Firstly, it should be pointed out that a clear majority of

customers for electrical industrial plant building stressed that they do not automatically award modernisation or extension contracts to the original suppliers of the electrics. This shows that manufacturers cannot currently tie the sale of one product to the sale of another (extension or modernisation) product to any great extent. As the merger does not create a dominant position in a possible electrical metal plant building market or any upstream or downstream market, the merger cannot have these consequences. Should suppliers, such as the parties, actually pursue such a strategy and should the situation be to the disadvantage of customers, they could react by covering their requirements from another supplier.²⁴²

(400) For these reasons even hypothetical non-horizontal effects of the proposed merger will neither create nor strengthen a dominant market position in any market for electrical metal plant building, or significantly impede effective competition in any other way.

(c) Maintenance and service of metal plants

(401) In this market too Siemens' and VA Tech's activities overlap. The Commission's market investigation, however, found no evidence that there would be competition concerns in the market for the maintenance and service of metal plants. The barriers to entry in this market are significantly lower than in the electrical and mechanical plant building markets. There are enough local competitors for the maintenance and servicing of metal plants. In some cases, customers of the metal plant-building sector are also able to carry out this work themselves.

(402) For these reasons the proposed merger will neither create nor strengthen a dominant market position in this market, or significantly impede effective competition in any other way.

(d) Electrical industrial plant building in other sectors

(403) In other (non-metal) areas of electrical plant building VA Tech is not active (mainly) through its subsidiary VAI, as is the case with metal plant building, but solely through its subsidiary, Elin EBG. Electrical plants are produced above all for the vehicle industry, for oil/gas, chemicals, pharmaceuticals, paper, cement, quarrying and food, beverages and tobacco.

(404) Siemens operates mainly in the oil/gas, chemicals, pharmaceuticals, paper, cement, quarrying and food, beverages and tobacco sectors.

(405) There are no competition concerns regarding the planned merger in connection with any possible product market definition (i.e. in relation to a market covering several sectors or taking each sector as a separate market).

(406) According to Siemens, geographically speaking, the only significant overlaps with combined shares that could technically denote an affected market are in Austria, where Elin EBG focuses much of its activities.

(407) Customers in Austria consulted by the Commission raised no concerns regarding competition. The general view was that the disappearance of VA Tech as a supplier

²⁴² This would make the strategy economically questionable from the supplier's point of view.

would reduce the number of competitors but there would still be enough competitors in the market or industrial companies that were potential customers could enable other suppliers to enter the Austrian market.²⁴³

(408) If the geographical confines of the markets are extended beyond Austria (for specialist sectors, for example) the merger will have only a slight impact. No competition concerns were raised in this connection that are relevant to this assessment.

(409) For these reasons the merger will not significantly impede effective competition in any market for (other) industrial plant construction, in particular as a result of the creation or strengthening of a dominant position.

(e) Summary regarding the electrical metal plant building markets and the market(s) for electrical industrial plants in non-metal sectors

(410) For these reasons the proposed merger will neither create nor strengthen a dominant market position in any of the markets for electrical plant building or the market(s) for electrical industrial plants in non-metal sectors or significantly impede effective competition in any other way.

F. LOW-VOLTAGE SWITCHBOARDS

1. Relevant product markets

(411) Siemens and VA Tech both produce low-voltage (LV) switchboards. While Siemens manufactures the components for the switchboards itself, VA Tech purchases them from other companies, including Siemens, and incorporates them in its LV switchboards. LV switchboards are used to feed in and distribute energy to connected electricity users and to protect and support them. The main components of LV switchboards are circuit breakers and switch disconnectors, programmable logic controllers and contactors. In the Schneider/Legrand Decision the product market for circuit breakers and switch disconnectors was subdivided into the three categories of ACB, MCB and MCCB LV circuit breakers.

(412) Market participants held the view that there were three separate product markets for LV switchboards, depending on which of these circuit breakers and switch disconnectors were incorporated in the switchboard. This were held to the main LV switchboard, which contains an air circuit breaker (ACB), the intermediary distribution panel, which contains a moulded case circuit breaker (MCCB), and the final distribution panel, which contains a miniature circuit breaker (MCB). The question of whether these three LV switchboards constitute separate markets can however be left open, as the competition assessment is unaffected by any assumption of separate product markets.

²⁴³ Particular reference should be made to the discussion of the technical general contractor for building engineering (non-industrial plant engineering and construction) in this Decision. The competitive conditions in the industrial plant building sector in Austria are similar to those set out there, with the added factor that ABB is another competitor in the industrial plant building and engineering sector in Austria.

- (413) One competitor took the view that, in addition to the three submarkets based on the circuit breakers, there is also a separate market for busways. Like heavy-duty cables, busways transport and distribute electricity to the final consumer in buildings and factories from medium voltage switchgear via LV switchgear. In a decision in 2004 the Federal Cartel Office held that busways were part of the single market for busways and heavy-duty cabling (cables including cable tray systems).²⁴⁴ There is no need for any decision here as to whether this is the case here, as the competition assessment remains unchanged even if it is assumed that there is a separate market for busways.
- (414) Other components built into LV-switchboards are programmable controllers („PLC”) and load feeders.
- (i) PLC are used to control the other components of a switchboard. PLC are electronic control devices, where the control sequences are determined by a programming language. Siemens is of the opinion that PLC should not be subdivided according to end-use. The only sector for which the market investigation of the Commission has pointed towards a possible sector specific application is the use of PLC in automation solutions for metallurgical plants. However, for the purpose of this decision it is not necessary to decide whether these applications, also referred to as application platforms, constitute a separate product market.
 - (ii) load feeders are used to protect and switch electrical consumers (e.g. motors) and consist of protection components (protection switches for motors, overload relays) and a switching device. It is not necessary to further segment the market, since all suppliers normally offer the entire range and customers typically order a complete package from suppliers.

2. Geographic markets

- (415) According to Siemens the market for LV switchboards has traditionally been determined by national factors. Today, both for individual components and LV switchboards competition is EEA-wide. Siemens points out that at component level there are no technical or legal trade barriers, and that transport costs are low. In relation to components for electrical installation, however, Siemens notes that in its decision in Schneider/Legrand the Commission concluded that such components were traded at national level and the market(s) for them were to be defined in national terms.²⁴⁵
- (416) LV switchboards are often produced to customer specifications. For this reason many customers emphasised the importance of national competition factors, especially the importance of and need for proximity to the customer as a prerequisite for responding quickly to customers’ special requirements. Many of those consulted viewed strong, technically competent national branches as a minimum requirement for success in the market, frequently going as far as to argue that national production plants were necessary. As Siemens’ takeover of VA Tech is unlikely to create

²⁴⁴ Federal Cartel Office decision in Siemens/Moeller, Ref.: Z. B-7, 36-04, <http://www.bundeskartellamt.de/wDeutsch/download/pdf/Fusion/Fusion04/B7-36-04.pdf>, paragraph 11.

²⁴⁵ COMP/M.2283 - Schneider/Legrand.

significant impediments to effective competition even if the markets are defined nationally, the question of the relevant geographic market for components and ready-assembled switchboards can be left open.

3. Competition assessment

- (417) If the market is taken to be the EEA, there would be no affected market for LV switchboards according to Siemens, since Siemens and VA Tech together have a market share of only [2-5]*%. If the markets were to be defined nationally, Austria would be a horizontally affected market. According to Siemens' figures, their joint market share in 2003 was [20-30]*% (Siemens [5-10]*%, VA Tech [10-15]*%), where the market volume was €[50-60]* million.
- (418) The market investigation has however revealed that, given a similar total volume of €[50-60]* million, their market share is actually higher. It showed that Siemens and VA Tech together accounted for [...] (Siemens [2-5]*%, VA Tech [...]*). Their chief competitors are Mehler with [30-40]*% and Moeller with [20-30]*%. Schneider Electric and Sprecher Automation are also competitors.
- (419) If one assumes separate markets for LV switchboards, which operate as main distribution, sub-distribution and final distribution boards, there are overlaps only in the case of main distribution boards, not with sub-distribution or final distribution boards. In the case of main distribution switchboards (ACB) Siemens and VA Tech together would have a market share of [...] (Siemens [10-15]*%, VA Tech [...]*). Mehler would remain market leader with a share of [40-50]*%, ahead of Moeller, which has a share of [20-30]*%.
- (420) Siemens produces and supplies all major components needed for fitting and assembling LV switchboards. In addition to the ACB, MCCB and MCB circuit breakers, this includes busways. VA Tech buys all its components from a number of suppliers. As Siemens and VA Tech together have over 25% of the Austrian market for the downstream market in LV switchgear, the market is vertically affected. The market investigation revealed, however, that in 2003 Siemens did not have a market share of more than 15%-20% for any of the circuit breakers or disconnecter switches in the EEA or in Austria. In Austria the clear market leader for ACBs and MCCBs is Schneider Electric, while Moeller is the leader in the market for MCBs. There is therefore little danger of market foreclosure, especially as such a strategy could result in suppliers from neighbouring countries such as Germany or the Czech Republic expanding their presence in the region into Austria.
- (421) Siemens has been supplying busways on a large scale only since 2004, when the company took over the busways business from Moeller.²⁴⁶ On the overall market for busways and heavy-duty cable claimed by Siemens, the company would have a market share of less than [5-10]*% in Austria. According to the market investigation, on a separate market for busways Siemens had a market share of [20-30]*% in 2003, followed by Schneider Electric with 20-25% and smaller suppliers such as EAE Elektrik and Pogliano. In view of these market shares, the existence of credible competitors and the fact that suppliers from neighbouring countries could

²⁴⁶ Federal Cartel Office decision in Siemens/Moeller, Ref.: Z. B-7, 36-04, <http://www.bundeskartellamt.de/wDeutsch/download/pdf/Fusion/Fusion04/B7-36-04.pdf>.

enter the Austrian market if prices were to rise suggest that market foreclosure is again unlikely.

- (422) With regard to PLC in the automation of metallurgical plants (automation platforms) there is an overlap, since both Siemens and VA Tech are suppliers, although VAI does not produce the hardware itself and developed the software for the automation platforms in cooperation with third parties. It is, however, not necessary to decide, whether there could be a separate horizontally or vertically affected market, since there are in any event sufficient alternatives to the products of the two suppliers²⁴⁷. All major suppliers of automation solutions for metallurgical plants offer comparable products: SMS Demag (X-Pact), Alstom (Alspa, previously Logidyn), ABB (Industrial IT), TMEIC (Toshiba V- Series), Ingelectric (Sisteam OCS), Rockwell Automation (Automax), Danieli (HiPac).
- (423) In all other applications of PLC there are no horizontal overlaps. Concerning vertically affected areas such as LV-switchgear or control gear of energy generation, transmission and distribution, there will be no market foreclosure effects either, since competitors of the parties, which do not have their own PLC, have sufficient alternatives such as Schneider Electric, Rockwell, Omron, Mitsubishi, B&R, Beckhoff, Moeller or ABB.
- (424) For the same reasons, i.e. no horizontal overlap, sufficient number of credible competitors, this is also true for load feeders. Important competitors are Schneider Electric, Moeller, ABB, Rockwell, GE and Lovato.
- (425) To sum up, it is unlikely that after taking over VA Tech Siemens would be in a position to significantly impede effective competition in the Austrian market, or any other national or EEA-wide market, for LV switchboards and the requisite components.

G. BUILDING SERVICES ENGINEERING AND FACILITY MANAGEMENT

G1. BUILDING SERVICES ENGINEERING

1. Relevant product markets

- (426) Siemens and VA Tech are active in the field of building services engineering, which in Siemens's view must be segmented into three levels: the component level, the system level and the installation level. Siemens states that, although there are markets for facility management (see G.2), other services should be allocated to the respective primary market.²⁴⁸ The component and system levels should be divided according to area of application. At the component level, a distinction should be made above all between the areas of electrical installation technology, safety technology, control and instrumentation technology and HVAC (heating, ventilating and air-conditioning), and at the system level between safety technology and control and instrumentation technology. Lastly, at the installation level, a distinction must be drawn between electrical and mechanical contracting.

²⁴⁷ Siemens: Simatic S7 and Simatic TDC; VA Tech: Vantage. [...]*

²⁴⁸ The market survey found no evidence to the contrary.

(a) Component level

(427) At component level the activities of Siemens and VA Tech do not overlap, as VA Tech is not active in this segment.²⁴⁹ There are, however, component markets that may be vertically affected. At component level Siemens distinguishes between three affected segments: components for technical management, safety technology components and components for electrical installation technology.

(1) Building management technology

(428) Building management technology involves the measuring, controlling, regulating and using of heating, ventilating, air-conditioning and other technical equipment (but not the controlled heating, ventilating and air-conditioning systems themselves, which are part of the HVAC system, a field in which neither of the parties are active). Based on the findings of its market investigation, the Commission shares Siemens' view that there is at least a separate market for building management technology components. The question of a further subdivision of building management technology components can remain open for the purposes of this Decision.

(2) Safety technology

(429) With regard to the market for safety technology components proposed by Siemens, the Commission's market investigation suggests a distinction ought to be made at least between the areas of fire protection and access control/intruder detection. The question of a further subdivision can remain open for the purposes of this Decision.

(3) Electrical installation technology

(430) With regard to electrical installation components, Siemens distinguishes between low-voltage switchboards and all other low-voltage products, such as switches, outlets, bus systems and cables. With the exception of bus system components, which the Commission's market investigation suggested constituted a separate market, the question of the market definition of the other electrical low-voltage products can remain open for the purposes of this Decision.

(b) System level

(431) At system level, there are overlaps in the control and instrumentation and safety technology segments, and in the case of safety technology a distinction ought to be made at least between the areas of fire protection and access control/intruder detection.²⁵⁰ At system level, system integrators assemble electrical operating systems from the abovementioned components tailored to meet the needs of the specific user.

²⁴⁹ As regards components in the special field of low-voltage switchboards see section F above.

²⁵⁰ Even if there may be requests for both fire protection and access control/intruder detection, orders are usually placed separately. Moreover, the areas have different legal bases, with fire protection in particular being subject to special public regulations and standards. The vast majority of market participants therefore saw the two areas as separate product markets.

(432) Although there may be further subdivisions at system level, it is sufficient for the purposes of this Decision to distinguish between relevant product markets for fire protection systems, access control/intruder detection systems and control and instrumentation systems.

(c) Installation level

(433) In Siemens' view the installation level covers in particular universal electrical contracting by a contractor. The complete electrical installation covers the design and installation of the energy supply infrastructure. The maintenance of general electrical equipment is also covered.²⁵¹ As the individual systems for the building safety and control and instrumentation technology (also known as "works") are regularly put out to tender with the electrical installation as an overall package and awarded as such, suppliers of electrical installation technology usually build the entire electrical system. It is their job to integrate the individual systems in the overall system, connect them to the energy supply and take full responsibility for the electrical system. The individual systems are either produced by the builders themselves or purchased from subcontractors. The single products used in the electrical installation are also regularly bought in. In Siemens' view, it is often impossible to make a clear distinction between installation level and system level.

(434) Siemens views installation in the non-electric area of HVAC (the electrical control of which comes under the separate building management technology, as shown above) as a separate market in mechanical contracting. This market encompasses the complete value chain, consisting of design, engineering, assembly, installation, commissioning, project management and the maintenance of heating, ventilating and air-conditioning systems and sanitary installations.

(435) Both Siemens (through the joint venture Siemens-Bacon) and VA Tech are involved in electrical and mechanical plant building in Austria. VA Tech sees the focus of its operations in the area of building services engineering as being an EPC contractor (EPC = engineering, procurement and contracting), responsible for integrating the various systems (the works). VA Tech includes HVAC in this field of operations. The market investigation showed that there may be a separate, overlapping market for the construction of electrical and mechanical building installations by a technical general contractor (TGC) bearing overall responsibility.²⁵² TGCs offer comprehensive technical installation of buildings from one source. While TGCs are responsible for all planning, coordination and installation of building services engineering, they often do not carry out parts of the installation themselves, using subcontractors instead. Tenders for TGCs are issued in particular in connection with major projects.

(436) For the purposes of this Decision it can be left open whether there are separate markets for electrical and mechanical installation in the buildings segment, as Siemens claims, or whether there is a separate market for TGC services that covers both electrical and mechanical installation.

²⁵¹ Where they cannot be allocated to facility management, which Siemens views as a separate product market; for further details, see G.2.

²⁵² The parties' activities in this area relate as a rule to non-industrial building installations (residential and office buildings and such structures as concert halls, museums, hospitals and tunnels).

(437) In any case, it should be noted that neither Siemens nor VA Tech take the view that the market(s) include the civil-engineering planning and execution of buildings, an area in which the parties are not active. This was confirmed by the Commission's market investigation.

2. Relevant geographic markets

(438) In Siemens' view, all the markets referred to above in part G1 (with the exception of the market for installation technology components) are at least EEA-wide.

(439) At component level, Siemens points out that in general there are no technical or legal trade barriers and only occasional variations on European standards particularly the standards and norms prepared by the European Committee for Electrotechnical Standardization (CENELEC). With regard to electrical installation technology components Siemens points out, however, that in its Schneider/Legrand decision the Commission concluded that the components were traded on national markets and the market(s) for such components was (were) to be defined in national terms.²⁵³

(440) At system level, Siemens argues that standardisation at product level makes it easier to offer systems throughout the EEA. In many areas no national permits were needed, and where they were needed differing requirements were only minor obstacles. Customers bought EEA-wide and suppliers were active at European level at least. Custom-built systems could be used anywhere in the world and there were no regulatory trade barriers.

(441) At installation level Siemens assumes that the market is at least EEA-wide, as there is a bidding market with the major suppliers of electrical installation operating EEA-wide and tenders are also regularly issued at European level. Transport costs are low on the market for electrical contracting. In the case of mechanical contracting the only differences are climate-related, with emphasis either on heating or air conditioning. In Siemens' view this does not justify making regional distinctions.

(442) In the Commission's view, it cannot be excluded that there are national markets at all three levels. Contrary to the view adopted by Siemens, they are in fact likely to exist.

(443) At component level there are significant national differences with regard to market shares and it must be borne in mind that the process of regulating and standardising at European level is by no means complete. This can also be seen from an announcement by Siemens that notes, when writing about [...]*'s work, that the work on harmonisation in preparation for the Construction Products Directive is being "continued and stepped up with the [...]* working groups." There still seem to be clear national differences with regard to consumption patterns. Similarly, products seem to be distributed at national level. This is the case notwithstanding the fact that many components are manufactured at supranational level.

(444) At system level, the Commission's market investigation produced the following results. On the one hand the market participants questioned (competitors and customers) said that in many cases systems manufacturers and suppliers operated

²⁵³ COMP/M.2283 – Schneider/Legrand.

transnationally, EEA-wide or even further afield. However, they also pointed out that the systems were often actually assembled at national level and were subject to national regulations, particularly in the case of fire protection. In addition to the international operators, there are also smaller national suppliers who have a major influence on competition at system level. Demand from consumers was also primarily at national level, with customers attaching great importance to the proximity of the service providers. A large number of the customers and competitors asked considered supply and demand to be nationally structured in the (at least) two product markets for safety technology systems and the product market for building management technology systems.

- (445) Lastly, at installation level, it is true that the cost of transporting the equipment is relatively low. However, this certainly does not apply to the labour force, a particularly important factor with regard to installation, and mobility across large areas would increase costs considerably. Siemens' and VA Tech's conduct on the market itself indicates that the markets are national at installation level. [...]*
- (446) However, the market investigation also produced evidence that bidders from other EU Member States were increasing tendering for major building projects in Austria, particularly for TGC contracts, and a number of such contracts had already be performed. The question of whether the market definition for TGCs can be broader than a national market can remain open for the purposes of this Decision, as, even if the market were defined as national, the merger does not significantly impede competition in the EEA or in a substantial part of it.

3. Competition assessment

- (447) At the component level, it is only in a vertical respect that there can be any relevant markets inasmuch as VA Tech is not itself active in these markets and buys products in. Siemens states that it has a market share of over 25% only for building management technology components, in Belgium, Finland, Luxemburg, the Czech Republic, Sweden and Slovakia. However, in these national markets there are no horizontally affected system or installation markets. Siemens estimates its market share in Austria at [20-30]*%, but a number of market participants questioned by the Commission in the course of its market investigation thought it could be larger.
- (448) In Siemens' view there are no vertically affected markets for components for building safety technology (fire protection or access control/intruder detection), where it has a total market share of [5-10]*% in Austria and no more than [5-10]*% in any other Member State.
- (449) Siemens also maintains there are no affected markets for installation technology components. On an overall market for installation technology components,²⁵⁵ which – as stated above – the Commission does not accept, only in Latvia would Siemens have a market share of just over [15-20]*%. In Austria the market share would be only [5-10]*%.

²⁵⁴ In Austria Siemens operates in the installation area primarily through a joint venture (with Ortner AG) under the name of Siemens Bacon.

²⁵⁵ For components in the special area of low-voltage switchboards see section F above.

- (450) During the Commission's market investigation, however, one competitor raised concerns primarily regarding Siemens' strengthened position in various markets for components for installation and building management technology in Austria. This competitor feared that VA Tech's demand that was not linked to any manufacturer would be switched to Siemens, which would enable Siemens to achieve or bolster a dominant position on components markets. In particular, fears were expressed regarding Siemens' large market shares in component markets for a number of disconnectors and in the market for busbar systems. It should also be noted that Siemens states it has a relatively large market share of a possible Austrian market for contactors (2003: [30-40]*%) and a possible market for programmable logic controllers (2003: [30-40]*%), which Siemens also sees as vertically affected markets.
- (451) The market investigation provided insufficient evidence that the merger would put Siemens in a position to foreclose the said component markets in Austria to its competitors. As shown below, there is sufficient competition in the markets for downstream systems and installations. At the immediate downstream systems level, the addition of market shares due to the merger would, moreover, be very small. In the said component markets themselves, Siemens faces competition from large, internationally established companies (in the case of installation technology components, among others ABB and Möller, and in the case of building management technology components, Honeywell, Johnson Controls and Sauter).
- (452) According to Siemens, at system level the fire protection systems market would be horizontally affected in Austria, where it has a market share of [30-40]*%, and this might also be the case in some other Member States (however, only on the hypothetical basis of the highest assumption of VA Tech's sales). According to Siemens' figures, at national level the market for intruder detection and other security systems (above all access control) would be horizontally affected only in Austria ([15-25]*%; Siemens: [15-20]*%, VA Tech: [2-5]*%).
- (453) In the case of management systems/building management works Siemens believes the market in Austria is horizontally affected, as the combined market share in 2003 was [20-30]*% (Siemens: [20-30]*%, VA Tech: [2-5]*%), and some markets could be affected in other Member States.
- (454) According to the company itself, VA Tech is not at all active at the systems level. VA Tech attributes all of its turnover in this area to contracting. VA Tech's figures and Siemens' market assessment also show that the horizontal impact of the merger in the area of individual works outside Austria are marginal, and within Austria there are no relevant markets with a market share addition of more than [5-10]*%.
- (455) The Commission's market investigation revealed only occasional and minor concerns regarding the possible impact of the merger at system integration level in the area of individual works in Austria. This is particularly true in the case of fire protection and other security systems (intruder detection, access control). The market participants stressed that there were a sufficient number of alternative systems providers and integrators. Mention was made of companies including Tyco, Schrack-Seconet, Fiegl und Spielberger, Minimax and Labor Strauss (fire protection systems), PKE, ARS, Group 4 Securicor, EVVA, Tyco, Bosch or Securitas/Schrack (intruder detection and other security systems), as well as Johnson, Honeywell and Sauter whom Siemens estimated to each have market shares of [15-20]*% in 2003

(building management systems). There are also value added partners (VAPs), which according to Siemens are medium-size systems producers and electrical contractors with engineering and IT expertise that offer systems-level integration using bought-in components and are increasingly offering ancillary services.

(456) The merger will not create any significant vertical impediment to competition, as there is genuine competition upstream at component level and downstream at installation level (as is shown below) and Siemens is unlikely to be able to foreclose the market to competitors.

(457) At installation level, there are significant overlaps between VA Tech and Siemens only in Austria.²⁵⁶ Siemens puts its share of the market for electrical building installation in Austria at [2-5]*% and VA Tech's at [5-10]*%, while their combined share of the market for mechanical building installation is put at [2-5]*%. Therefore, according to Siemens' figures, neither of the markets for electrical and mechanical contracting is affected. The market investigation confirmed this claim in the case of mechanical contracting. There are, however, doubts as to whether, contrary to Siemens' estimation, Siemens und VA Tech together may not have over 15% of the market for electrical contracting. Most pronounced is the direct competitive position and the respective market strengths of Siemens and VA Tech in the possible submarket for technical general contractors, where there are fewer medium-sized and small companies active than in the area of general electrical and mechanical contracting. A number of market participants in Austria believe that the combined market share is well over 15%, although in some cases estimates vary considerably and do not produce a clear picture. There is general agreement that Siemens und VA Tech would have the strongest market position regarding TGC contracts in Austria. These contracts are often awarded by tendering procedures. Some of the customers consulted pointed out that the merger would reduce the number of suppliers in Austria. However, only a few said that where they awarded TGC contracts to VA Tech or Siemens the respective other company was otherwise the most promising competitor.

(458) VA Tech's and Siemens' key competitors for TGC contracts in Austria are the international operators RWE Solutions and MCE. In recent years MCE has taken over activities such as non-industrial building services engineering from ABB Österreich. Other major international suppliers of TGC services, such as the Dutch Imtech group (through its German subsidiary) and M+W Zander (Germany) perform TGC contracts in Austria. The market investigation also showed that medium-sized electrical contractors such as, for example, Klenk & Meder, Landsteiner and Bostelmann operate in the market through consortia with HVAC companies. Through the acquisition of suppliers of mechanical contracting, both Klenk & Meder and Bostelmann have recently acquired their own internal HVAC capacity, which puts them in the position to take on TGC contracts alone. There are also some smaller Austrian companies operating as technical general contractors (e.g. Elmont).

²⁵⁶ This is based on the assumption that Siemens is not active in the controlling function in the Czech Republic. This means that the company Eltodo, in which, according to market participants, Siemens has a 49% holding and which appears to be active in the area of electrical contracting, is not controlled by Siemens.

- (459) The mere presence of several major international operators shows that even in the case of major building projects that would make particular demands on the financial resources of TGCs, it cannot be assumed that after the merger Siemens' and VA Tech's operational scope would extend beyond the control of competition. The market investigation also revealed that if there were not enough bidders for TGC contracts, particularly for major projects, customers would simply issue individual tenders for several systems/works instead of a global TGC contract and take over planning and integration themselves or engage the services of engineering consultants. This is already happening today. In particular large customers such as the major construction companies Porr and Strabag have in recent years developed their own building services capacities to perform TGC tasks themselves.
- (460) For these reasons, it is therefore unlikely that the merger will significantly impede competition by creating or strengthening a dominant market position in TGC services in Austria. This is also the case with electrical contracting, where, in addition to the above-mentioned companies, there are also a wide variety of medium-sized and small suppliers.

G2. FACILITY MANAGEMENT

1. Relevant markets

- (461) Both Siemens and VA Tech offer facility management services. Facility management includes technical facility management (including energy management, inspection, and the maintenance and repair of building services equipment), commercial facility management (especially accountancy) and general facility management (including security services, cleaning and caretaker services). According to Siemens, these three forms of facility management (technical, commercial and general) constitute a single product market. The market investigation, however, found that they are separate markets, since while the three forms of facility management are sometimes requested together, demand is mostly for individual forms and a number of competitors do not offer the full range of services. However, the market investigation substantiated Siemens' view that any further distinction based on types of building (such as residential and office buildings, shopping centres or industrial plant) or size of buildings was unnecessary. As the merger does not give rise to any competition concerns whatever the market definition, i.e. whether there are separate markets or a single market, the question of the precise product market definition can be left open.

2. Relevant geographic markets

- (462) Siemens takes the view that the market for facility management is EEA-wide. However, most of the market participants consulted as part of the market investigation felt that the markets for the three different forms of facility management were national.²⁵⁷ The question of the precise geographical market definition can, however, be left open for the purposes of this Decision as effective competition is not significantly impeded in any of the alternative geographical markets examined.

²⁵⁷ Cf. COMP/M.3172 – Ferrovial/Amey (ultimately left open).

3. Competition assessment

- (463) According to Siemens, irrespective of whether the markets are defined as national or larger, neither the facility management market as a whole, nor the technical facility management, commercial facility management and general facility management markets would be affected. In the cases of commercial and general facility management, the Commission's market investigation discovered no evidence that the planned merger would have any impact on competition. The market investigation also reveals that even in the case of technical facility management in Austria, where the direct competitive position and the respective market strengths of Siemens and VA Tech are most pronounced, competition is unlikely to be impeded significantly and Siemens/VA Tech are unlikely to achieve a dominant position.
- (464) Siemens' figures for its share of the technical facility management market in Austria and those of VA Tech and its most important competitors are as follows: Siemens [5-10]*%, VA Tech [5-10]*%, Energiecomfort [10-15]*%, Honeywell [5-10]*%, Axima [5-10]*%, MCE [5-10]*%, M+W Zander [5-10]*% and Vamed [2-5]*%. The other market participants, however, believe Siemens and VA Tech to be in a stronger position on the Austrian market. Competitors' estimates are basically as follows: Siemens 15-25%, VA Tech 10-22%, Axima 12-20%, VAMED 20%, M&W Zander 10%, Energiecomfort 9%, Teletech 8%, MCE 8%. Customer estimates reflect this discrepancy, although customers tend to lower estimates of the market shares of Siemens (6-20%, in one instance 30%) and VA Tech (6-20%) and estimate that MCE's and Teletech's shares are somewhat larger (both 5-15%).
- (465) Most of Siemens's and VA Tech's customers indicated in the market survey that the respective other party was not the most promising competitor in the context of the tendering or negotiated procedure. Many replies pointed out that in Austria there are a number of other suppliers whose services in the area of technical facility management are from a customer standpoint basically equivalent to those of VA Tech and Siemens. Even smaller companies would, especially at regional level, exert competitive pressure on the above-mentioned larger competitors. Customers also consider foreign suppliers of technical facility management services, who are not yet operating in Austria or operating only on a small scale, to be serious potential competitors (e.g. WISAG, Dussmann, HOCHTIEF and DIW, all of which come from Germany). Hochtief and DIW are already working on projects in Austria. Finally, the market investigation also revealed that in view of the various financially strong actual and potential competitors there are no grounds to fear that competition will be impeded significantly even in the case of major contracts.

H. INFRASTRUCTURE INSTALLATIONS AND ELECTRICAL EQUIPMENT FOR ROPEWAYS

HI. TRAFFIC INFRASTRUCTURE INSTALLATIONS

1. Relevant markets

- (466) With respect to traffic infrastructure installations, there is a small amount of overlap between Siemens and VA Tech in Austria only.

(a) Street lighting, traffic signalling equipment and parking-lot management systems

(467) Siemens and - to a lesser extent - VA Tech are both active in street lighting, traffic signalling equipment and parking-lot management systems. The merger raises no competition concerns under any of the possible market definitions, i.e. taking the above infrastructure installations as separate markets or an overall market. The exact definition of markets can therefore be left open for the purposes of this Decision. The same applies to the question of whether, as Siemens believes, there is an EEA-wide market or markets, or whether national markets should be assumed.

(b) Traffic control systems

(468) There is also an overlap between the activities of Siemens and VA Tech in traffic control, although VA Tech's activities have hitherto been confined solely to Austria – and even there they are of minor significance. In the traffic control sector a distinction can be drawn between national/regional traffic management systems for the trunk road network (motorways and expressways) and municipal traffic computer centres for controlling traffic on major urban roads.

(1) National/regional traffic management systems

(469) National/regional traffic management systems for the trunk road network consist mainly of a central traffic control centre (which gathers, processes and disseminates traffic-related data) and various outlying installations (route stations with traffic data logging equipment and traffic control equipment). The market investigation showed that – in Austria at least – traffic control centres (including subcentres) were commissioned separately from the various outlying installations. The fact that different companies tender for outlying installations and for control centre technology also suggests that the product markets are distinct. From a geographical point of view, it is worth noting that the technical standards laid down for the Austrian traffic management system are the same as those applied in Germany for example and that, as a result, German companies have already taken part in calls for tenders in Austria. In the end the product and geographic market definition can remain open for the purposes of this Decision, as the merger raises no competition concerns under any of the possible market definitions.

(2) Municipal traffic computer centres

(470) Municipal traffic computer centres control traffic detection and flow management in urban areas. They consist essentially of a traffic computer (or interconnected computers under an overarching traffic management system), control devices for light signalling equipment and detection equipment. According to customers and competitors surveyed by the Commission, the standards and technical requirements for municipal traffic computer centres differ widely from those applied to national traffic management systems. In the case of municipal systems, the control centre technology and individual control installations are usually commissioned as a package, which is not the case with national systems. Here too there is no need for an exact product and geographic market definition for the purposes of this Decision, as the merger would not significantly impede effective competition in the EEA or in a substantial part thereof, no matter which of the possible definitions were applied.

2. Competition assessment

(a) Street lighting, traffic signalling equipment and parking-lot management systems

(471) The merger has only a marginal effect on municipal infrastructure - even if the markets in question are defined as national ones - as the only horizontal market affected is that for *light signalling equipment* in Austria, but even there Siemens states that the added market share is less than 1%, barely strengthening Siemens' current position of [30-40]*%. Moreover, public tendering is mandatory in this field, so that market entry appears to be possible in Austria (the market investigation even produced some evidence of an emerging European market) and there are sufficient alternatives to Siemens, namely Swarco, Signalbau Huber (M-Tech), Gesig, Dambach, Kapsch and Peek Traffic.

b) Traffic control systems

(1) National/regional traffic management systems

(472) In the field of national/regional traffic management systems for motorways and expressways, VA Tech has hitherto been active solely in Austria and has only set up two small route stations for traffic flow management. [...] on the one occasion when there was a call for tenders for control centre technology and IT for the Austrian traffic management system, but the contract was awarded to a joint venture between Siemens and Heusch/Boesefeldt. The market investigation confirmed Siemens' statement that, for the foreseeable future, there is no demand in Austria for further control centre technology and IT at the core of the national traffic management system. Furthermore, the same technical standards apply in Austria as in Germany, so that suppliers operating in Germany could easily take part in calls for tenders in Austria (should demand resurface). The only potential buyer (Asfinag, the state-owned enterprise responsible for Austria's entire motorway and expressway network) raised no objections to the merger. Moreover, taking into account Asfinag's power as a buyer, it cannot be stated that the merger would significantly impede effective competition.

(473) The same applies to the setting-up of outlying installations of the Austrian traffic management system for motorways and expressways, which are the subject of separate calls for tenders. Asfinag estimates that in the next ten years the total value of orders for outlying installations to be put out to tender will be EUR 350 million. Of the contracts awarded to date, most have been won by Siemens or by consortia involving Siemens. VA Tech has taken part in award procedures alongside a number of other tenderers (in particular construction firms with their own electrical departments, such as Strabag and Alpine Energie). To date VA Tech has only set up two route stations for traffic flow management. The sole customer in Austria, Asfinag, claims that, after the merger, there will be a range of firms able to fill VA Tech's role in the market and compete with Siemens for contracts for outlying installations: Alpine Energie, Strabag ATG, Grimm DÜRR and RWE. Asfinag has therefore raised no objections to the merger. The market investigation also revealed that, given the identical technical standards in Germany, firms operating there (such as Weiss Electronic, Dambach, QSG and ave) are also in a position to set up outlying installations for the Austrian traffic management system.

(474) Irrespective of whether the relevant product market is considered as a whole or divided into control centre technology and outlying installations, the merger does not lead to any significant impediment to competition in the EEA or in a part thereof and in particular does not lead to the creation or strengthening of a dominant position.

This also applies even if the relevant geographic market is still considered to be Austria, as VA Tech's activities are essentially confined to Austria.

(2) *Municipal traffic computer centres*

- (475) VA Tech is less active in municipal traffic computer centres than in national/regional traffic management systems. According to its own statements, VA Tech has obtained [...] in the last five years - to expand an urban traffic computer centre in Austria. Its main competitors in this field are Siemens, Signalbau Huber and Gesig. The market investigation also found that Zetsch, Pichler and Alpine Energie are significant competitors, to which must be added the actual or potential competitors from Germany - Dambach, Stoye and Weiss Electronic. Dambach for one states that it has already taken part in calls for tenders in Austria. The customers surveyed by the Commission (local authorities in major Austrian towns and cities) raised no objections to the merger on competition grounds. Given VA Tech's hitherto weak market position and the presence of a range of serious current and potential competitors, the merger does not lead to any significant impediment to competition in the EEA or in a substantial part thereof and in particular does not create or strengthen a dominant position. This applies whether the relevant geographic market is defined as national or as extending beyond Austria's borders (as VA Tech only operates in Austria).
- (476) Since the merger does not lead to any significant impediment to competition in either national/regional traffic management systems or municipal traffic computer centres, no competition concerns would be raised either if these two sectors were deemed to overlap to form a single market.

H2. WATER TREATMENT INSTALLATIONS

1. Relevant markets

- (477) The question of the relevant market can also remain open in the water treatment field, as the proposed merger raises no competition concerns. Siemens assumes that the market is at least EEA-wide. In an earlier Commission decision the scope of the geographic market was left open, although the Commission's investigations also pointed to an EEA-wide market.²⁵⁸ In the end the exact geographic market definition can remain open in the present case, as effective competition would not be significantly impeded in any of the alternative geographical markets in the EEA - or in a substantial part thereof - that have been investigated.

2. Competition assessment

- (478) In the water treatment field the only slight overlap is in electrotechnical components for water treatment installations, where in any case the market shares do not exceed [2-5]*% even if the market is defined as national and subdivided further (e.g. biofiltration, dosing systems). The merger does not therefore lead to a significant impediment to effective competition.

H3. ELECTRICAL EQUIPMENT FOR ROPEWAYS

²⁵⁸ Case IV/M.1514 Vivendi/US Filters, paragraphs 14 *et seq.*

1. Relevant markets

(479) In other non-industrial plant building, the planned merger leads to overlaps as regards electrical equipment for ropeways. Both Siemens and VA Tech supply ropeway manufacturers with electrical components and ropeway operators with all the electrical equipment they need as a package.

(a) Supply of electrical components to ropeway manufacturers

(480) There are now essentially two large manufacturers of ropeway installations worldwide - Doppelmayr/Garaventa and Leitner/Pomagalski. Both firms supply their customers mainly with turnkey systems, encompassing both mechanical and electrical installations. The two manufacturers used to buy in a large proportion of their electrical equipment, but they have since considerably expanded their own electrical capabilities and now obtain only a very small fraction of the electrical components they need from third parties (e.g. Siemens, Pilz and ABB). Siemens states that the specifications for electrical ropeway building are not fundamentally different from those for other electrical industrial plant building. In particular, the components used are said to be similar and there are now no longer any separate developments for ropeway technology as regards power and automation. The Commission's market investigation also found some evidence to support this view. An exact definition of the relevant market can therefore be left open, as the merger would not seriously impede effective competition in the EEA or in a substantial part thereof, even assuming a narrow definition of the product market (specific electric components for ropeways). The same applies to the geographic market definition, although the market investigation points to an EEA-wide market.

(b) Supply of electrical equipment to ropeway operators

(481) While the great majority of ropeway operators buy turnkey systems, others purchase individual components of ropeway installations (mechanical parts, cables, electrical and automation technology, etc.) separately from different suppliers and either assemble them themselves to produce a complete ropeway or commission engineering firms to do this for them. Such customers report that they do not normally buy components as separate individual parts (e.g. engine, power converter, control system, display system, instrumentation and control technology, etc.) but obtain all electrical equipment for ropeways from suppliers as a unit. The question of whether packages of electrical equipment for ropeways could constitute a separate product market can however remain open, as the merger would not significantly impede effective competition in the EEA or a substantial part thereof, even assuming such a product market definition.

(482) From a geographical point of view, Siemens claims that the market is EEA-wide. By contrast, most of the customers surveyed by the Commission argue that the market is a national one. The market investigation also showed that previously existing barriers to market entry (legal standards for ropeway electrics) were removed by Austria's implementation in 2004 of Directive 2000/9/EC of the European Parliament and of the Council of 20 March 2000 relating to cableway installations designed to carry persons²⁵⁹ and that, since the uniform standards came into effect,

²⁵⁹ OJ L 106, 3.5.2000, p. 21.

bidders from other Community Member States have increased their presence in Austria. However, the question can remain open, as the merger would not significantly impede competition in any of the alternative geographic markets that have been investigated.

2. Competition assessment

(a) Supply of electrical components to ropeway manufacturers

(483) In response to the market investigation, it was stated that Siemens/VA Tech would acquire a monopoly in the supply of electrical components to ropeway manufacturers. However this is incorrect. Both of the large global players in ropeway manufacturing - Doppelmayr/Garaventa (Austria/Switzerland) and Leitner/Pomagalski (Italy/France) - produce much of the electrical equipment for their ropeways themselves. Only to a very small extent do they buy in electrical components for their ropeways. [...] However, the manufacturers also purchase electrical components from a whole series of other suppliers. VA Tech provides only a very minor part of these supplies. Consequently, Doppelmayr/Garaventa and Leitner/Pomagalski stated in the market survey that the merger would have no implications for competition in electrical components for ropeways. It can therefore be assumed that the planned concentration would not lead to a dominant position for Siemens and VA Tech, even on a narrow definition of the relevant product market (electrical components for ropeways) and geographic market (Austria), or to any other significant impediment to competition.

(b) Supply of electrical equipment to ropeway operators

(484) There is also an overlap between Siemens and VA Tech in the supply of separate electrical equipment to ropeway operators who do not buy turnkey installations or who renew part of their installations. At present Siemens and VA Tech are the biggest suppliers of electrical equipment to ropeway operators in Austria. Siemens argues that, even after a merger between VA Tech and Siemens, there would still be no shortage of independent suppliers. This view was also largely confirmed by the market investigation. Up to now Doppelmayr/Garaventa and Leitner/Pomagalski have generally supplied complete ropeway installations, but, given their growing in-house expertise in the electrical field, they are also exerting competitive pressure on firms that supply only electrical equipment for ropeways. According to customers, both Doppelmayr/Garaventa and Leitner/Pomagalski are also able and willing to supply electronic equipment for ropeways separately.

(485) Furthermore, the market investigation found that smaller firms are gaining ground. In Austria this applies in particular to the firm Berchthold, which customers readily expect to take over the market role currently played by VA Tech. Foreign suppliers of electrical equipment for ropeways are also playing a bigger part, for example Frey (Switzerland),²⁶⁰ SISAG (Switzerland), BEW (Italy) and Seirel (France). The two Swiss firms in particular can already cite projects in Austria as a reference. Access was made much easier for foreign suppliers when Austrian technical standards for

²⁶⁰ The firm was previously active in Austria only through its subsidiary STG, which filed for insolvency in 2004. However, Austria has been and still is among Frey's areas of activity, as evidenced by its participation at the Austrian trade fair "INTERALPIN" (see the list of exhibitors at <http://www.congress-innsbruck.at/events/interalpin/deutsch/Ausstellerliste2005.pdf>).

ropeways (including electrical equipment) were brought into line with the requirements of Directive 2000/9/EC²⁶¹ in 2004.

- (486) In view of these facts, it cannot be assumed that the concentration would impede effective competition in the common market or in a substantial part thereof, particularly not as a result of the creation or strengthening of a dominant market position.

I. OTHER IT SERVICES

1. Relevant market

- (487) In addition to their activities in the various markets described above, Siemens and VA Tech also operate in other areas of information technology. There is no overlap between their respective commercial activities as regards hardware and software, the only area in which there is such an overlap being IT services. Siemens assumes a uniform product market for IT services. However, the exact definition of the market can remain open, as the merger has no relevant implications for competition from either a sector-specific angle or applying a distinction based on the size of buyers. The same applies to the question of whether the market is EEA-wide, as Siemens argues, or whether it should be considered as narrower, i.e. corresponding to national level or to a certain language area (the fact that VA Tech operates only in Austria and Germany points to such a conclusion).

2. Competition assessment

- (488) No market is affected in the field of IT services. The Commission's market investigation unearthed no evidence that the concentration would have any relevant implications for competition. It cannot therefore be assumed that there will be any significant impediment to effective competition in the field of other IT services.

VI. COMMITMENTS

- (489) By letter dated 25 May 2005, Siemens submitted commitments under Article 8(2) of the Merger Regulation in order to address the Commission's competition concerns. These commitments were slightly amended by letter dated 13 June 2005. The full text of the commitments is set out in Annexes I and II to this Decision and forms an integral part of the Decision.
- (490) The gist of the commitments relating to equipment and services for hydroelectric power stations is as follows: Siemens undertakes to sell VA Tech Hydro GmbH & Co. ("VA Tech Hydro"), a power-generation company forming part of VA Tech, to a suitable buyer that is independent of the parties and subject to the Commission's approval. VA Tech Hydro will be sold as a going concern, i.e. including all tangible and intangible assets existing at the time the commitment was given, and its entire workforce. Siemens promises to keep intact the viability and competitiveness of the business to be divested. It also undertakes to manage the business separately up to the time of the sale.

²⁶¹ OJ L 106, 3.5.2000, p. 21.

(491) To dispel the Commission's competition concerns in the field of metal plant building, Siemens makes the following commitments:

- (1) Siemens will exercise its right to be represented on the shareholders' committee of SMS, as enshrined in the SMS shareholders' agreement, by appointing as its representative an independent trustee, with the Commission's approval; in the period up to the appointment of the trustee, Siemens will not take part in meetings of the shareholders' committee.
- (2) Siemens will do its utmost to ensure that the seats it holds on SMS' supervisory board pursuant to the shareholders' agreement and the concomitant legal status are assumed by two independent trustees appointed by Siemens, with the Commission's approval. The trustees will also exert all other information rights, consultation rights and administrative rights, including voting rights, instead of Siemens. [...]*
- (3) Siemens will ensure that only the aforementioned trustees and not Siemens will receive information from SMS that is not publicly available. The only exceptions to this obligation are as follows:
 - information required by Siemens to meet its legal obligations regarding financial reporting and drawing up the group's financial statement [...]*
 - information on the valuation of Siemens' holding in SMS at 31 December 2004 and relating solely to the period up to that date [...]*
- (4) Siemens will not contest, cancel or revoke the exercise of the put-option at 31 December 2004;²⁶² for a specified period it will not acquire any shares in SMS, unless the Commission has found that the market structure has changed in such a way that this undertaking is no longer necessary.

VII. COMPETITION ASSESSMENT OF THE PROPOSED CONCENTRATION IN THE LIGHT OF THESE COMMITMENTS

A. EQUIPMENT FOR HYDROELECTRIC POWER STATIONS

(492) The sale of VA Tech Hydro removes entirely the overlap for competition purposes between Siemens and VA Tech in the market for equipment for hydroelectric power stations. The commitments were presented to customers and competitors as part of a market test. They considered that Siemens' divestment of VA Tech Hydro was an entirely effective measure to remove the competition concerns raised by the proposed merger as originally notified. A number of respondents to the market test pointed out that VA Tech Hydro's activities in fossil-fuel power generation (i.e. a field in which there are no competition concerns) would have to remain with the business being divested in order to guarantee its market viability. It was also pointed out that the business divested would have to have access to products relating to network control technology for hydroelectric power stations. Such access is ensured

²⁶² [...]*

at present by the 50% share in VA Tech SAT GmbH & Co. ("SAT"). The remaining shares in SAT are held by VA Tech. The wording of the commitment meets both of these concerns.

B. METAL PLANT BUILDING

- (493) In the light of the Commission's investigations, the commitments concerning SMS as described at paragraph (491) are sufficient to reasonably dispel the competition concerns regarding the markets for metal plant building. The commitments ensure that Siemens cannot use its position as minority shareholder [...] to obtain any strategic knowledge about SMS' business policy. In addition, Siemens' voting rights will be transferred to the trustee or trustees to be appointed. Furthermore, the commitments ensure that Siemens will permanently and irrevocably sell its holding in SMS by exercising the put-option or by other means. There is therefore no reason for any weakening of competition between Siemens/VAI and SMS in the markets affected, something which would be expected in the absence of such commitments.
- (494) Siemens' undertaking to transfer the exercise of its aforementioned rights to an independent trustee appointed with the Commission's approval takes due account of the fact that, with effect from 31 December 2004, Siemens exercised the put-option for the purposes of transferring its holding to SMS, and that the sale of this holding to an independent buyer, which would have been required otherwise, has already been initiated. Siemens' commitment not to obtain information on SMS that is not publicly available allows exceptions that are necessary to enable Siemens to meet its legal obligations regarding financial reporting and drawing up the group's financial statements and to allow Siemens to defend its legal position in the ongoing legal dispute. In each case they are confined to what is strictly necessary for the purpose in hand. In particular, the exception for information that is relevant to the legal dispute is confined to information relating to the past, thereby excluding from the outset any information that might be significant for SMS' future competitive strategy. The transfer of the voting rights to the trustees ensures that Siemens cannot, even as a minority shareholder, influence any strategic decisions of SMS.
- (495) The commitments were presented to customers and competitors as part of a market test. The overwhelming majority of those canvassed believe that the commitments are suitable to prevent the transmission to Siemens of strategic knowledge about SMS and hence to meet competition concerns. Any criticism of the commitments was directed mainly at the general choice of a trusteeship solution rather than the immediate sale of Siemens' holding in SMS. It was suggested by some that the trusteeship solution could in itself dampen competition if it were to be maintained over a long period - depending on the duration of the legal dispute on the valuation of Siemens' holding in SMS. However, such criticism is irrelevant to the competition concerns raised by the Commission in this Decision relating to the markets for metal plant building. As has been explained, the Commission's concerns are based on the expectation of a weakening of competition between Siemens/VAI and SMS because Siemens might have access to strategic knowledge by dint of its rights as minority shareholder. This access to strategic knowledge is no longer possible as a result of the commitments. Also, it can be assumed that the capacity of SMS' corporate bodies to act is guaranteed on the basis of the legal provisions, in particular as the business management of the company is determined by the majority

shareholder. There is therefore no indication that the trustee solution as such will lead to an impediment to competition.

- (496) Finally, it was argued that Siemens would not be able to fulfil these commitments as they would encroach on the legal position of the majority shareholders of SMS under the shareholders' agreement. However, this is not the case. [...] The appointment of trustees to represent Siemens on the shareholders' committee and the supervisory board changes neither Siemens' position as shareholder nor the legal status of the shareholders' agreement. In particular the trustees do not acquire the legal status of SMS shareholders in Siemens' place. Under these circumstances it is not clear why Siemens should be unable to fulfil the commitments or why this would constitute encroachment on the rights of third parties.

VIII. CONDITIONS AND OBLIGATIONS

- (497) In accordance with the first sentence of the second paragraph of Article 8(2) of the Merger Regulation, the Commission may attach to its decision conditions and obligations intended to ensure that the undertakings concerned comply with the commitments they have entered into vis-à-vis the Commission with a view to rendering the concentration compatible with the common market.

- (498) Measures that give rise to a structural change to the market must be made subject to conditions, while the implementing steps necessary to achieve this result constitute obligations on the parties. Where a condition is not fulfilled, the Commission decision declaring the merger to be compatible with the common market is null and void. Where the parties commit a breach of an obligation, the Commission may revoke the clearance decision in accordance with Article 8(6)(b) of the Merger Regulation; fines and penalty payments may also be imposed on the parties under Article 14(2)(d) and Article 15(1)(c) of the Merger Regulation.

- (499) In accordance with the fundamental distinction described above, the Commission makes its decision subject to the condition of full compliance with the commitment to sell VA Tech Hydro as a going concern, including all of its activities in the field of equipment and services for hydroelectric power stations, by the end of the extended deadline for sale to a purchaser approved by the Commission.

- (500) All remaining parts of the commitments set out in Annex I, in particular the obligation to maintain temporarily and manage separately the business to be divested and the details concerning the trustee to be appointed by the parties, must be made the subject of obligations, since they are meant to only implement the aforementioned conditions.

- (501) In view of the undertakings in Annex II, the Commission makes this decision conditional on full compliance with the commitment that Siemens will not contest, cancel or revoke its exercise of the put-option as of 31 December 2004 and will not, for a specified period, acquire any shares in SMS, unless the Commission finds that the market structure has changed in such a way that this undertaking is no longer necessary. The remaining commitments set out in Annex II regarding the rights enjoyed by Siemens as a shareholder of SMS under the shareholders' agreement must also be the subject of obligations.

IX. CONCLUSION

(502) Provided that the commitments entered into by Siemens are complied with in full, it can be accepted that the planned concentration does not lead to a significant impediment to effective competition in the common market or in a substantial part thereof and in particular that it does not create or strengthen a dominant position. Subject to full compliance with the commitments set out in the Annex, the concentration can therefore be declared compatible with the common market in accordance with Articles 2(2) and 8(2) of the Merger Regulation and compatible with the functioning of the EEA Agreement in accordance with Article 57 of that Agreement,

HAS ADOPTED THIS DECISION:

Article 1

The notified concentration by which Siemens acquires control over VA Tech within the meaning of Article 3(1)(b) of the Merger Regulation is hereby declared compatible with the common market and with the functioning of the EEA Agreement.

Article 2

Article 1 shall apply on condition that the commitments entered into by Siemens and set out at points B.1 to 3 of Annex I to this Decision and in the first and third sentences of point B.IV of Annex II to this Decision are complied with in full.

Article 3

This Decision is issued subject to the obligation that the other commitments entered into by Siemens and set out in Annexes I and II are complied with in full.

Article 4

This Decision is addressed to:
Siemens Aktiengesellschaft
Wittelsbacherplatz 2
Germany - 80333 Munich

For the Commission
Neelie KROES
Member of the Commission

EUROPEAN COMMISSION

The Hearing Officer

FINAL REPORT OF THE HEARING OFFICER
IN CASE COMP/ M.3653 - SIEMENS / VA TECH

**(pursuant to Articles 15 and 16 of Commission Decision (2001/462/EC, ECSC)
of 23 May 2001 on the terms of reference of Hearing Officers
in certain competition proceedings – OJ L162, 19.06.2001, p.21)**

The notified concentration

On 10 January 2005, the Commission received a notification of a proposed concentration pursuant to Article 4 of Council Regulation (EC) No 139/2004 of 20 January 2004 (“the Merger Regulation”) whereby Siemens AG of Germany (“Siemens”) acquires within the meaning of Article 3(1)(b) of the Merger Regulation control of the whole of the Austrian company VA Tech AG (“VA Tech”) by way of public bid announced on 10 December 2004.

The proposed transaction would lead to numerous horizontal and vertical overlaps in the fields of power generation, power transmission and distribution, automation & drives, rail transport equipment, metallurgy and electrical plant engineering, building technology and communal infrastructure.

The initiation of proceedings and the issue of access to key documents

At the end of the first phase of the investigation, the Commission concluded that the concentration raised serious doubts as to its compatibility with the common market and with the EEA Agreement. On 14 February 2005, the Commission therefore initiated proceedings in accordance with Article 6(1)(c) of the Merger Regulation.

On 2 March 2005 Siemens was provided with access to the “key documents” in the Commission file in accordance with chapter 7.2. of the “Best Practices on the conduct of EC merger control proceedings” (“Best Practices”), as determined by the Directorate General for Competition. By letter of 16 March 2005 Siemens requested access to further documents. In particular, they considered that documents transmitted by VA Tech ought to be of particular interest for the case and should therefore qualify as key documents. In their reply of 6 April 2005, the Directorate General for Competition confirmed their view that the documents in question did not constitute key documents. It was considered that irrespective of their source, the documents requested did not constitute substantiated submissions of third parties running counter to the notifying parties’ views as set out as definition of key documents in the Best Practices. Siemens did not officially request me to intervene in this respect.

The issuance of the statement of objections and the procedural issue created by Voith Siemens with their request for an oral hearing: The notion of other involved parties

A statement of objections was sent to Siemens on 22 April 2005. In the following days, access to the Commission's file was granted. Siemens was asked to reply by 6 May 2005. This deadline was complied with.

Neither Siemens, nor VA Tech requested to develop their arguments in a formal oral hearing.

However, with a letter dated 6 May 2005 and registered 10 May 2005, the joint venture Siemens Voith Hydropower Generation GmbH & Co. KG ("Voith Siemens"), between J.M. Voith AG and Siemens AG, requested in writing a formal oral hearing pursuant to Article 14(2) of Commission Regulation (EC) 802/2004 of 7 April 2004 ("the Implementing Regulation"). They considered that, given that they might be directly affected by a remedy that Siemens might propose to the Commission, they should be considered as "other involved party" in the sense of Article 11 (b) of the Implementing Regulation.

In my written response of 13 May 2005, I took the view that Voith Siemens did not qualify as an "other involved party" and was therefore not entitled to request a formal oral hearing, in the presence of the Member States and of the associated services of the Commission, although they could of course request to be heard by the people in charge in writing or orally at any point in time. Thereinafter, the seller and the target of a concentration, companies which are indicated as examples for "parties to the proposed concentration" in Article 11 (b) of the Implementing Regulation constitute "other involved parties", because they are directly and inevitably concerned by the implementation of the proposed concentration. This determines the fact that they are "Parties to the proposed concentration" as expressed in the Regulation.

By contrast, it is uncertain and can only be determined at the end of a merger proceeding whether companies will be directly affected by commitments which need to be proposed by the notifying parties and have to be accepted by the Commission.

Therefore, the mere fact that the remedies agreed on in the context of a merger proceeding might have an impact on a company cannot justify that the latter qualifies as an "other involved party", since they do not fall under the denomination of "Parties to the proposed concentration"

The market test

On 25 May 2005, Siemens offered commitments which were slightly amended on 7 June 2005. The market test of the proposed undertakings has been generally positive.

I have not been asked to verify the objectivity of the enquiry.

The further requests for access to documents also in relation to the notion of other involved parties.

By letter to the relevant Commission service dated 9 June 2005 and by letter to me dated 22 June 2005, SMS Demag AG, and its parent company SMS GmbH ("SMS") requested access to the case file. This request was rejected by the Directorate General for Competition on 22 June 2005 on the ground that SMS was recognized as an interested third party and not as an "other involved party" in the sense of Article 11 (b) of the Implementing Regulation

and was therefore not entitled to have access to the file under the Implementing Regulation. By decision of 6 July 2005 pursuant to Article 8 of the Hearing Officer's Mandate, I confirmed the point of view taken by the Directorate General for Competition on the grounds that the mere fact that the remedies envisaged in the context of a merger proceeding might have an impact on a third company could by no means justify that the latter qualifies as an "other involved party" in the sense of Article 11 (b) of the Implementing Regulation.

This is confirmed by whereas 11 of Regulation 802/2004 according to which, upon request, other involved parties must be granted the opportunity before notification to discuss the intended concentration informally with the Commission. This shows that the legislator acted on the assumption that the identity of an "other involved party" results from the intended concentration itself, this being determined before potential remedies are proposed. Accordingly, the qualification of a company as an "involved party" cannot depend on the manner in which the remedies eventually proposed affect certain companies.

Notwithstanding the above, SMS was provided with a non-confidential version of the Statement of Objections and was given the opportunity to comment thereon. Furthermore, SMS received non-confidential versions of the commitments in the context of the market test, insofar as they related to the metallurgical markets in which SMS have an interest. Therefore, I take the view that SMS had ample opportunity to state its views during the proceeding.

On 24 June 2005 Siemens requested access to the file for non-confidential documents received by the Commission since the statement of objections. The company was provided with the opportunity of obtaining access to these documents on 1 July 2005.

In the light of the above, I consider that the rights to be heard of all participants to the present proceeding have been respected.

Brussels, 6 July 2005

(signed)

Serge DURANDE

EUROPEAN COMMISSION

Competition DG

Policy and Strategic Support

OPINION

of the ADVISORY COMMITTEE on CONCENTRATIONS

given at its 133rd meeting on 29 June 2005

concerning a draft decision relating to

Case COMP/M.3653 – SIEMENS/VA Tech

1. The Advisory Committee agrees with the Commission that the notified operation constitutes a concentration within the meaning of Article 3(1)(b) of Regulation 139/2004 and that it has a Community dimension.
2. The Advisory Committee agrees with the Commission that for the purposes of assessing the present operation, the relevant product markets are:

In power generation:

- a) the equipment for hydro power plants;
- b) the provision of turnkey combined cycle gas-fired power plants;
- c) the supply of gas turbines, the exact delineation of this(these) market(s) can be left open;
- d) the supply of generators, the exact delineation of this(these) market(s) can be left open;

In transmission and distribution:

- e) High voltage products (>52kV);
- f) Transformers;
- g) Energy automation and – information;
- h) Turnkey projects;
- i) T&D services;

with a possible further delineation according to individual components; the exact scope of the relevant market being left open;

In rail:

- j) Electrical traction for trams, metros, regional trains and locomotives;
- k) Trams, metros, electrical and diesel powered regional trains and locomotives;
- l) Catenary wire, the exact delineation of this(these) market(s) can be left open;
- m) Rail power supply: substations, components for substations and servicing of rail power generation plants;
- n) Level crossings;

Frequency inverters:

- o) the exact delineation of this (these) market(s) can be left open;

In metallurgy:

- p) Mechanical metallurgical plant building (limited to iron/steel or including non-ferrous metals) or mechanical metallurgical plant building per process step and metal, whereby the exact delineation of this(these) market(s) can be left open;
- q) Electrical metallurgical plant building (as a whole) or electrical metallurgical plant building per process area, process step and metal, or Level 1 and 2 automation of metallurgical plants (as a whole or parts thereof, for entire metallurgy or per process step and metal), or Level 3 automation, whereby the exact delineation of this(these) market(s) can be left open;
- r) Maintenance services for metallurgical plants;
- s) Electrical plant building for non-metallurgical industrial plants, whereby the exact delineation of this(these) market(s) can be left open;

In LV-switchgear:

- t) Fully fitted LV-switchboards, or, in the alternative, separate for the three components ACD, MCB and MCCB;
- u) Components: busways, the exact delineation of this(these) market(s) can be left open;
- v) Components: PLC [the exact delineation of this(these) market(s) can be left open] and load feeders;

In building technology and facility management:

- w) Components for building control technology, safety technology separate for fire alarm and access/intruder control and electrical installation technology;
- x) Systems: entire security systems and control systems;
- y) Electrical and mechanical contracting, possibly also a market for general technical contractors;
- z) Facility management, the exact delineation of this(these) market(s) can be left open;

In infrastructure and ropeways

- aa) Traffic infrastructure: Street lighting, traffic lights, parking space control, the exact delineation of these markets can be left open;
 - bb) Traffic control, the exact delineation of this(these) market(s) can be left open;
 - cc) Water purification plants;
 - dd) Electrical equipment for ropeways, the exact delineation of these markets can be left open.
3. The Advisory Committee agrees with the Commission that for the purposes of assessing the present operation, the relevant geographic markets are as follows :
- a) the markets for power generation are EEA-wide in scope;
 - b) the markets for T&D is EEA-wide in scope;
 - c) the markets for electrical traction are EEA-wide in scope;
 - d) the markets for trams, metros, electrical and diesel powered regional trains and locomotives are national where there is a strong national industry (here: Austria, Belgium, Germany, Poland, Czech Republic, Spain), and the EEA for the rest;
 - e) the market for catenary wire is national in scope;
 - f) the markets for rail power supply are assessed on a national basis but it can be left open whether they are national or EEA-wide;
 - g) the market for level crossings is assessed on a national basis;
 - h) the market for frequency inverters is EEA-wide in scope;
 - i) the markets for electrical and mechanical metallurgical plant building are at least EEA-wide in scope, the market(s) for maintenance services is/are EEA-wide in scope, and the market(s) for non-metallurgical plant building is/are national or EEA-wide in scope;
 - j) the markets for LV-switchgear and components are assessed on a national basis but it can be left open whether they are national or EEA-wide;
 - k) the markets for building technology and facility management are assessed on a national basis but it can be left open whether they are national or EEA-wide;
 - l) the markets for infrastructure and ropeways are assessed on a national basis but it can be left open whether they are national or EEA-wide.
4. The Advisory Committee agrees with the Commission that the notified concentration will significantly impede effective competition in a substantial part of the common market within the meaning of Article 2(3) of the Merger Regulation:
- a) In the market for hydro power generation;
 - b) In the market for mechanical metallurgical plant building or in the markets for mechanical plant building for steelmaking and for continuous casting.

5. The Advisory Committee agrees with the Commission that the commitments submitted by the parties are sufficient to remove :
- the competitive concern in the market for hydro power generation resulting from the horizontal overlap of the concentration;
 - the competitive concerns in the market(s) for metallurgical plant building resulting from horizontal effect of the concentration, in particular the privileged access of Siemens to strategic information of SMS Demag; and that, as a result, the concentration should be declared compatible with the Common Market.
6. The Advisory Committee asks the Commission to take into account all the other points raised during the discussion.

THE COMMISSION OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Community,

Having regard to the Agreement on the European Economic Area, and in particular Article 57 thereof,

Having regard to Council Regulation (EC) No 139/2004 of 20 January 2004 on the control of concentrations between undertakings¹, and in particular Article 8(2) thereof,

Having regard to the Commission's decision of 7 July 2005 to initiate proceedings in this case,

Having given the undertakings concerned the opportunity to make known their views on the objections raised by the Commission,

After consulting the Advisory Committee on Concentrations²,

Having regard to the final report of the Hearing Officer in this case³,

WHEREAS:

¹ OJ L 24, 29.1.2004, p. 1

² OJ C ...,...200. , p....

³ OJ C ...,...200. , p....

- (1) On 2 June 2005, the Commission received a notification pursuant to Article 4 of Regulation (EC) No 139/2004 (“the Merger Regulation”) of a proposed concentration by which the undertaking E.ON Ruhrgas International AG (“ERI”) acquires, within the meaning of Article 3(1)(b) of the Merger Regulation, control of the whole of the undertakings MOL Földgázellátó Rt. (“MOL WMT”, Hungary) and MOL Földgáztároló Rt. (“MOL Storage”, Hungary), currently solely controlled by MOL Hungarian Oil and Gas Rt. (“MOL”, Hungary), by way of purchase of shares. ERI will also acquire MOL’s shareholdings in Panrusgáz Magyar-Orosz Gázipari Rt. (“Panrusgáz”, Hungary), a joint venture company between OAO Gazprom (“Gazprom”, Russia) and MOL.
- (2) After examination of the notification, the Commission has concluded that the notified operation falls within the scope of the Merger Regulation and raises concerns as to its compatibility with the common market.

I. THE PARTIES

A. E.ON

- (3) ERI is a solely-controlled subsidiary of E.ON Ruhrgas AG, which is in turn an indirect subsidiary of E.ON AG (Germany). The three companies are members of the E.ON group of companies which is a privately owned energy company with a focus on the supply of electricity and gas. The acquiring party will be henceforth referred to as “E.ON”.

B. MOL

- (4) MOL is an integrated oil and gas group which is primarily active in Hungary on the markets for natural gas, oils, fuels and chemicals. It is a public company listed on the Budapest stock exchange. The Hungarian state still owns 12% of share capital, plus a golden share.

II. THE OPERATION AND THE CONCENTRATION

A. Operation

- (5) The companies which are being acquired are the following solely-controlled subsidiaries of MOL:
 - MOL WMT (an acronym for Wholesale, Marketing and Trading) is a public utility wholesaler and gas trader which supplies natural gas to regional gas distributors, industrial customers and large power plants in Hungary;
 - MOL Storage operates five natural gas storage facilities located in Hungary and is only active in providing storage services.

- (6) E.ON will acquire an interest of 75 % minus 1 share in both MOL WMT and MOL Storage. The agreements provide for a 5-year put option under which MOL can sell its remaining 25 % plus 1 share interests in MOL WMT and MOL Storage to E.ON.
- (7) E.ON is also acquiring MOL's 50% shareholding in Panrusgáz. Panrusgáz is a joint venture between OOO Gazexport ("Gazexport"), a subsidiary of Gazprom and MOL. 50 % of the shares in Panrusgáz are currently held by MOL, whereas 40 % of the shares are held by Gazexport and 10 % by Interprocom (a company having close ties with Gazprom).
- (8) MOL Földgázz szállító Rt. ("MOL Transmission"), another solely-controlled subsidiary of MOL, is not acquired by E.ON through the present transaction. MOL is instead granted a put option under which MOL can require E.ON to purchase a 25 % plus 1 share or a 75 % minus 1 share interest in MOL Transmission during the next two years.
- (9) Finally, MOL retains control over its gas exploration and production business (the MOL upstream gas Exploration and Production division ("MOL E&P")). However, as part of the transaction, MOL and MOL WMT have entered into a new long-term gas supply agreement for the gas produced by MOL E&P (the "Supply Agreement").

B. Acquisition of MOL's shareholding in Panrusgáz

- (10) The parties claim that the only business of Panrusgáz is to purchase gas from Gazexport for onward sale to MOL WMT. Therefore, Panrusgáz is only active for its shareholders and has no business relationships with third parties. It is thus submitted that Panrusgáz is technically not a party to the concentration because it does not constitute a full-function joint venture. Based on the information available, the Commission is inclined to regard Panrusgáz as a non full-function joint venture and its acquisition is therefore not part of the concentration assessed in the present case.
- (11) In any event, the acquisition of MOL's stake in Panrusgáz will have to be taken into account in the competitive assessment of the transaction in view of the crucial importance of access to gas resources from abroad and in particular from Russia.

C. Put option relating to MOL Transmission

- (12) The proposed transaction does not result in a change of control of MOL Transmission and this company is therefore not part of the concentration assessed in this case.
- (13) In any event, the put option foreseen by the agreements will be considered in the competitive assessment of the transaction in view of the crucial importance of access to the gas transmission network.
- (14) Finally, the Commission notes that the change in control that may result from the exercise of the put option would at any rate constitute a concentration for merger

control purposes and would thus be closely scrutinised by the competent competition authorities (either the Commission or national competition authorities).

D. Concentration

- (15) In view of the structure of the transaction, the acquisition of sole control over MOL WMT and MOL Storage by E.ON constitutes the concentration assessed in this case.

III. COMMUNITY DIMENSION

- (16) The undertakings concerned have a combined aggregate world-wide turnover of more than EUR 5 000 million⁴. Each of the undertakings concerned has an aggregate Community-wide turnover in excess of EUR 250 million, but they do not achieve more than two-thirds of their aggregate Community-wide turnover within one and the same Member State. The notified operation therefore has a Community dimension.

IV. PROCEDURE

- (17) On 7 July 2005, the Commission initiated proceedings in accordance with Article 6(1)(c) of the Merger Regulation.
- (18) On 2 August 2005, the procedure was suspended for eight days pursuant to Article 10(4) of the Merger Regulation owing to the fact that E.ON did not respond in a comprehensive and timely manner to a decision requiring information pursuant to 11(3) of the Merger Regulation.
- (19) A Statement of Objections (“SO”) was sent to E.ON on 19 September 2005. As agreed between E.ON and MOL, a version of the SO without E.ON's business secrets was transmitted to MOL by E.ON's legal representatives. In the following days, access to the Commission's file was granted. E.ON and MOL were given the opportunity to comment on the Commission's preliminary findings as set out in the SO by 3 October 2005. This deadline was subsequently extended to 6 October 2005 at E.ON's request. E.ON's reply was received on 5 October 2005. MOL's comments were received on 6 October 2005.
- (20) The parties did not request to develop their arguments in a formal oral hearing.
- (21) On 21 October 2005, the request of Energie Baden-Württemberg AG to be admitted as an interested third party was granted by the Hearing Officer. The same day, the Commission sent them a non-confidential summary of the SO.

⁴ Turnover calculated in accordance with Article 5(1) of the Merger Regulation and the Commission Notice on the calculation of turnover (OJ C66, 2.3.1998, p25).

- (22) On 20 October 2005, E.ON offered commitments which were amended on 11 November, 15 November and 8 December 2005 respectively. Further to the market testing of the proposed undertakings, E.ON substantially improved its draft commitments, in particular as regards the duration of the gas release program and the price mechanism of the gas release auctions.
- (23) In agreement with and following an express request by E.ON, to which MOL agreed, the Commission issued a decision on 10 November 2005 pursuant to Article 10(3) second paragraph of the Merger Regulation in order to extend the procedure by 11 working days.
- (24) The Advisory Committee on Concentrations discussed the draft decision on 6 December 2005.

V. RELEVANT MARKETS

- (25) The transaction affects the gas and electricity sectors. Natural gas and electricity activities can be delineated in several distinct product markets. The following analysis will deal first with the definition of the relevant natural gas markets and secondly with the definition of the relevant electricity markets.
- (26) According to previous Commission decisions, the definition of the relevant product market(s) must take into account the existing and foreseen degree of opening thereof⁵. Accordingly, each chapter will contain a description of the regulatory framework including the state of the opening of the gas and electricity markets in Hungary and their expected evolution.
- (27) It should be noted at the outset that, in their reply to the SO, the parties did not contest any of the relevant product market definitions.

A. *Relevant gas markets*

(i) *The natural gas sector in Hungary*

a. **Gas demand**

- (28) Natural gas is the largest source of energy in Hungary. Gas currently satisfies 48% of Hungary's primary energy consumption, which is the highest share in the Community⁶. Approximately 80% of the population consumes natural gas, and natural gas accounts for 25% of the electricity produced in Hungary. In 2004, the total Hungarian gas market represented 14.0 billion cubic meter ("bcm"), including 5.6 bcm for industrial and commercial customers, 3.2 bcm for power plants and 5.2 bcm for residential customers. Gas demand is expected to grow from 14 bcm in

⁵ See, inter alia, Commission decision of 9 December 2004 in Case COMP/M.3440 – EDP/ENI/GDP.

⁶ By comparison, natural gas accounts for 40% of the Netherlands' primary energy consumption and 39% of the UK's primary energy consumption. Contrary to Hungary, the Netherlands – as well as the UK until last year – is a net exporter of gas.

2004 to [15-20]* bcm in 2020 (about [0-2 %]* compounded annual growth rate), due to the increase in Hungarian gross domestic product and the increase in gas-fired electricity generation.

*Projections for Hungarian gas demand:*⁷

In bcm	Residential	Industrial	Power plants	TOTAL
2005	[5-7]*	[6-8]*	[3-5]*	[14-20]*
2010	[5-7]*	[6-8]*	[3-5]*	[14-20]*
2015	[5-7]*	[6-8]*	[3-5]*	[14-20]*
2020	[5-7]*	[6-8]*	[3-5]*	[14-20]*

[...]*

b. Gas sources

- (29) Natural gas is either imported from foreign sources or bought from Hungarian gas producers for it to be delivered to customers on the Hungarian market.

Domestic production

- (30) Hungarian gas production is not negligible and amounted to approximately 3 bcm in 2004, accounting for about 20% of national gas consumption. The entire national production is handled by the MOL E&P. It should be added that besides MOL E&P there is another small independent gas producer in Hungary, El Paso, who also sells its entire production to MOL WMT (around 0.2% of Hungarian national gas consumption)⁸.
- (31) There are different qualities of gas in Hungary. Most of the gas produced by MOL E&P is high-calorific gas⁹ ([2-4]* bcm in 2004). MOL E&P produces small quantities of low-calorific gas¹⁰ ([0-1]* bcm in 2004), and a gas of a lesser quality

* Parts of this text have been edited to ensure that confidential information is not disclosed; those parts are enclosed in square brackets and marked with an asterisk.

⁷ Parties' submission dated 29 August 2005.

⁸ The US company POGO is also active in gas exploration in Hungary but does not yet produce natural gas. POGO's Hungarian subsidiary POGO Hungary Kft. was acquired in June 2005 by the US company Toredor Resources Co. and will change its name to Toredor.

⁹ High-calorific gas is gas with higher combustion properties according to the Hungarian Standard 1648 MSZ 2/H.

¹⁰ Low-calorific gas is gas with lower combustion properties according to the Hungarian Standard 1648 MSZ 2/S. This gas has different parameters from the low-calorific gas in other countries (CO₂ rather than nitrogen prevails as a non-combustible component due to special geological reasons).

called “inert gas”¹¹ ([0-1]* bcm in 2004). The Hungarian gas production (for both high-calorific and low-calorific gas¹²) is declining.

Imports

- (32) Although there is a domestic natural gas production in Hungary, imports are key to satisfy the domestic natural gas demand, and Hungary is a net gas importer. In 2004, approximately 80% of natural gas consumed in Hungary was imported. The share of imports is expected to increase as Hungary’s natural gas production decreases.
- (33) Hungarian gas imports are traditionally and predominantly Russian gas. There are only two cross-border pipelines (“entry points”) through which gas is imported into Hungary: the Hungarian/Ukrainian entry point Beregovo (Brotherhood pipeline, capacity of 15.01 bcm/year or 43.1 million m³/day) and the Hungarian/Austrian entry point (Hungary-Austria Gasleitung (“HAG pipeline”) at Baumgarten, capacity of 4.5 bcm/year or 12.3 million m³/day). In addition, there is an exit point at the Hungarian/Serbian border through which Serbia and Bosnia-Herzegovina import Russian gas that transits through Hungary.
- (34) Capacities available at these entry points are essentially booked and used by MOL WMT to import gas under its long-term supply contracts. Capacities booked by MOL WMT for the gas year 2004/2005 were [10-12]* bcm/year and [25-35]* million m³/day (out of 15.01 bcm/year and 41.3 million m³/ day) at Beregovo and [1-4]* bcm/year and [6-10]* million m³/day (out of 4.5 bcm/year and 12.3 million m³/day) at the HAG entry point¹³. In addition, a transit capacity of [3-5]* bcm/year and [10-13]* million m³/day are booked at the Beregovo entry point by the Serbian company Nis and the Bosnian Herzegovinan company BHGas for transit. As a result, free capacity on the Hungarian entry point is very limited for other market players¹⁴.
- (35) Two additional gas pipelines are envisaged to link Hungary with Romania [...]*. The pipeline between Romania and Hungary has been contemplated for several years by MOL and Transgaz (Romania). Transgaz has already completed the Romanian section of the pipeline but the construction of the Hungarian section [...]*. The pipeline would link Algyő and Csanádpalota (100 km transmission line, 45 km of which in Hungary) and would have an initial capacity of [1-3]* million

¹¹ Inert gas is gas whose combustion properties are lower than for the MSZ 1648 2/S standard. Inert gas contains more carbon-dioxide and more nitrogen.

¹² Low-calorific gas fields will be empty within [...]*.

¹³ MOL WMT has booked [2-4]* bcm on the HAG pipeline with OMV, the Austrian gas incumbent, on a ship-or-pay basis until [...]*.

¹⁴ Although actual imports amounted to approximately [10-13]* bcm in 2004 (excluding transit), total annual booked capacities reached approximately [15-20]* bcm in 2004. This suggests that there is contractual congestion at the entry points (capacity booked but not fully used).

m³/day (approximately [0-2]* bcm/year). MOL's internal documents¹⁵ indicate [...]*.

- (36) In addition, Nabucco is a project for a new pipeline going from Turkey to Austria, crossing Bulgaria, Romania, and Hungary to bring Caspian and Middle East gas (from Azerbaijan, Iran, Syria, Egypt and Iraq, and even Kazakhstan and Turkmenistan) to European markets. The feasibility studies have already been performed and the project is currently at its planning stage. The operation phase is expected to start in 2011 and its yearly capacity will be either 25 bcm (base case scenario) or 31 bcm (high case scenario). According to parties involved in the project, it is expected that around [10-20]* bcm will be available at the Baumgarten hub for further transmission and distribution in Europe.
- (37) Prior to the market opening, the MOL group had a monopsonistic position on all gas procurement activities, with exclusive rights to purchase Hungarian gas and to import gas into Hungary. In order to secure its gas supply, MOL WMT has entered into long-term supply agreements (up to [...]* years) with [...]* to import gas through the Hungarian Western and Eastern entry points.
- (38) The long-term gas supply agreements of MOL include Take or Pay ("TOP") obligations. TOP obligations in gas supply contracts require the purchaser of the gas to pay in any event for a certain percentage (generally [70-90%]*) of the contracted quantities of gas, even if it does not take the whole contracted quantities. It means that the purchaser is obliged to pay the full price even if it has no opportunity to use or resell the gas. TOP losses typically occur if – due to market liberalization – certain customers switch, the consumption of which has been calculated by the given gas supplier when sourcing its gas to be resold. In such a case, the supplier does not need the whole amount of contracted gas, but it is obliged under the TOP obligation of its agreement to pay the TOP level. In the Hungarian gas system, TOP losses can be suffered by the Regional Distribution Companies ("RDCs") and by MOL WMT if eligible customers currently supplied by them switch to an alternative supplier. [...]*
- (39) As far as MOL WMT's Russian gas imports are concerned, Gazexport, the sole exporter of Russian gas, sells the relevant gas quantities to Panrusgáz, which in turn sells the same quantities onwards to MOL WMT. Imported natural gas flows thus directly through Panrusgáz to MOL WMT, on the basis of two "mirror contracts" concluded between Gazexport/Panrusgáz and Panrusgáz/MOL WMT. According to the agreements, natural gas is supplied to MOL WMT through the Brotherhood pipeline at Beregovo on the Ukrainian border and, to a lesser extent, through the HAG pipeline at Baumgarten on the Austrian border.
- (40) MOL WMT also buys gas from other sources, notably [...]* through the HAG entry point. Under pressure from the Hungarian government with the aim to improve the country's security of supply, MOL diversified its gas purchase portfolio ten years ago. It signed in 1995 and 1997 additional gas supply contracts (two contracts with duration of [10-20]* years with [...]* and one [...]* contract with [...]*) and established a new route connecting the country to the West European transmission

¹⁵ Proposal to MOL Executive Board Meeting [...]*, 9/12/2002, [...]*.

system¹⁶. The gas volumes supplied by [...] to MOL WMT are sourced from [...] overall gas purchase portfolio. This means that the gas sold by those companies to MOL WMT comes from all of [...] gas suppliers¹⁷ and cannot be linked to a specific supply contract of those companies.

- (41) Finally, MOL WMT had concluded gas supply contracts in 1998 with O&G Minerals Ltd. and Eurobridge which are suppliers of non-Russian gas. These contracts have now been terminated, and replaced by a 2004 contract (for an annual quantity of [0-2]* bcm) with Bothli-Trade, a Swiss company, affiliated with Eural Trans Gas. Eural Trans Gas was a Hungarian-registered company which was the sole distributor of Turkmen gas “with Gazprom and NAK Ukraine support”¹⁸.

c. Gas infrastructure

Transmission and distribution of gas

- (42) The Hungarian high-pressure natural gas transmission pipeline network is owned by MOL Transmission, which transports both domestic and imported natural gas to the RDCs, natural gas-fired power stations and certain other large industrial users that are directly connected to the transmission network.
- (43) The low- and medium-pressure distribution pipeline networks are extensive in Hungary, where 91% of the settlements are already connected to a natural gas network. The distribution networks are owned by the RDCs. There are six main RDCs in Hungary, each covering a different region of the country, and seven smaller ones¹⁹. The six main RDCs are TIGÁZ Rt. (“TIGÁZ”), FÓGÁZ Rt. (“FÓGÁZ”), DÉGÁZ Rt. (“DÉGÁZ”), ÉGÁZ Rt. (“ÉGÁZ”), KÖGÁZ Rt. (“KÖGÁZ”) and DDGÁZ Rt. (“DDGÁZ”). In 2004, approximately 76% of the total natural gas sales volumes of MOL WMT were accounted for by sales to the RDCs.

¹⁶ See minutes of the meeting with HEO on 26 July 2005.

¹⁷ See response of E.ON of 10 May 2005 to Question 39 on the draft Form CO: “E.ON Ruhrgas, parent of ERI, has a gas supply portfolio including different sources. E.ON Ruhrgas sells gas to its customers based on this diversified portfolio. It is not possible to break down the origin of the gas for the sales per country as E.ON Ruhrgas serves each customer out of the whole diversified portfolio.”; response of GDF to question 33 of the request for information of 19 July 2005.

¹⁸ Minutes of the Executive Board of MOL of 6 April 2004.

¹⁹ DBGÁZ Kft., TIGÁZ 2 Kft., OERG Kft., DUNAFERR ESZ. Kft. 1, DUNAFERR ESZ. Kft. 2, Csepel ESZ Kft., and Magyar Gázzolgáltató Kft. These RDCs are not further dealt with in the competitive assessment section of this decision, as they have marginal sales.

- (44) It should be noted that there are separate transport and distribution networks (owned by MOL Transmission and the RDCs respectively) for the 2/H and 2/S gas, as these different qualities of gas cannot be mixed. The low-calorific gas is distributed via separate regional systems coming from the gas fields of MOL E&P to mostly domestic customers. The low-calorific gas only represents 5% of total Hungarian gas production, or 1% of total Hungarian gas consumption. The regions currently supplied with 2/S gas [...]*
- (45) The inert gas produced by MOL E&P is transported via a direct pipeline and sold to [...]*. Inert gas represents [0-10%]* of total Hungarian gas production, or [0-5%]* of total Hungarian gas consumption.
- (46) Historically, the RDCs were also owned by MOL but were sold to private investors in a large privatisation process in 1995. E.ON has sole control of two RDCs (KÖGÁZ and DDGÁZ) and a participation in a third one (FŐGÁZ), which is controlled by the municipality of Budapest. Three large international energy groups own majority or minority stakes in the other RDCs: GDF (sole control of DÉGÁZ and ÉGÁZ), RWE (minority stakes in TIGÁZ, FŐGÁZ and DDGÁZ) and ENI/Italgas (sole control of TIGÁZ).

Ownership of the gas RDCs:

KÖGÁZ	71.2% E.ON 13.3% Julius Bar Holding AG 11.6% Swisspartners AG 3.9% Others
DDGÁZ	50.01% E.ON 49.9% RWE 0.1% Others
FÖGÁZ	50% +2 Municipality 32.7% RWE 16.4% E.ON 0.9% Others
DÉGÁZ	99.8% GDF 0.2% Others
ÉGÁZ	99.4% GDF 0.6% Others
TIGÁZ	50% +1 ENI-Italgas 44.2% RWE 7.9% Others

Storage of gas

- (47) MOL Storage owns and operates the five existing underground gas storage facilities in Hungary. All the underground storage facilities in Hungary are depleted gas fields. Storage allows in particular covering the variation between gas procurement, which is relatively constant throughout the year, and gas needs which vary greatly according to seasons. For technical geological reasons, the storage facilities in Hungary can only be used to cover seasonal variations of demand, but not for peak shaving²⁰. There is also a contract with the gas transmission system operator (“TSO”) to use the storage for system balancing purposes. The flexibility of the storage sites is not high, but it is sufficient to handle the balancing demand in Hungary along with line pack.
- (48) The five storage facilities have a total storage capacity of 3.38 bcm (with a withdrawal capacity of 44.5 million m³/day). There are two large storage sites (Hajdúszoboszló in the east with [1-2]* bcm, and Zsana in the south with [1-2]* bcm, undergoing capacity extension). The three other storage sites are much smaller ([250-400]* million, [150-250]* million and [100-200]* million m³). In addition, MOL E&P has more than 50 depleted gas fields. Almost every depleted gas field is convertible into an underground gas storage facility and the convertibility has been concretely examined for [...]*.

²⁰ It is not possible to use storage sites in Hungary for peak shaving for geological reasons, as these are sandstone depleted gas fields. Sandstone is too fragile and technically not suitable for rapid injection and withdrawal of gas into and from the storage facilities.

(ii) *Regulatory framework*

a. Current regulatory framework

- (49) The Hungarian natural gas sector is at the initial stage of the liberalisation process. The first European directive liberalizing the gas market was implemented in Hungary, with the entry into force on 1 January 2004 of the Hungarian Gas Act (Act 42 of 2003 – “HGA”)²¹. This law was further implemented by Government Decree No. 111/2003 on the execution of certain provisions of the HGA (“Executive Decree”) and Government Decree No. 112/2003 (as amended by Government Decree No. 219/2003) (“Eligibility Decree”). A law amending the HGA (Act 63) was adopted on 28 June 2005 to implement Directive 2003/55/EC of the European Parliament and the Council of 26 June 2003 concerning common rules for the internal market in natural gas and repealing Directive 98/30/EC²² in Hungary, and it entered into force on 1 August 2005. Further implementing decrees are being adopted.

Regulatory bodies

- (50) The Hungarian Energy Office (“HEO”) is the energy regulator in Hungary. The HEO is the general supervisory body for the gas market. It issues the various licences for gas and electricity activities, supervises the operation of the market players, approves their terms of business, examines customer complaints, undertakes price reviews and sanctions non-compliance.
- (51) The Hungarian Mining Office (“HMO”) is the special supervisory body dealing with the construction and operation of transportation pipelines and underground storage facilities. Licensing concerning the construction of these facilities also falls within the powers of the HMO.
- (52) The Ministry of Economy and Transport (“MET”) issues decrees on the more technical and specific fields (such as operational safety, general technical conditions etc.) and also sets official prices (tariffs) on the basis of a proposal by the HEO.
- (53) The Network Code (or Grid and Commercial Code) contains the detailed technical rules concerning the operation of the gas system, such as the definition and allocation of free capacities, the rules of nomination, the minimum content of trade, metering and accountancy agreements. The Network Code is prepared by a Network Code Committee and approved by the HEO. The Network Code Committee comprises representatives of the licensees (system operator, public utility

²¹ In addition to the Hungarian laws and decrees implementing the Gas Directives, other relevant legislation in the gas sector includes the Community Regulation on the conditions for access to the gas transmission networks (OJ L 289, 3.11.2005, p. 1), which will enter into force on 1 July 2006. This regulation ensures that the voluntary Guidelines for Good TPA Practice for Transmission System Operators adopted at the Madrid Forum will be implemented in all the Member States. Last, Guidelines for Good TPA Practice for Storage System Operators (“GGPSSO”) were adopted by the European Regulators Group for Electricity and Gas (“ERGEG”) on 23 March 2005, but compliance with these guidelines is voluntary and not mandatory at this stage (http://europa.eu.int/comm/energy/gas/madrid/jwg/ggpsso_23.3.2005.pdf).

²² OJ L 176, 15.7.2003, p. 57.

wholesaler, storage system operator, distribution system operators, public utility suppliers, gas traders, cross-border traders) and of the registered eligible customers²³.

Eligibility

- (54) Since 1 July 2004, all non-residential customers have become eligible customers free to choose their supplier under Hungarian law²⁴. Residential customers will become eligible on 1 July 2007.

Coexistence of regulated and liberalized segments

- (55) The Hungarian gas sector is characterized by a hybrid model, with the coexistence of a regulated segment of the market (or “public utility market”), resulting from the old gas regime in Hungary, and a liberalized segment of the market (or “open segment of the market”). Eligible customers have the right but not the obligation to exercise their eligibility and switch suppliers to enter the open segment of the market. They have the choice between remaining supplied within a public utility contract by their historic gas supplier (their RDC or the public utility wholesaler, MOL WMT if the customer was supplied directly by MOL WMT) or terminating their public utility contract and purchasing their gas requirements from a trader or a producer or importing natural gas themselves²⁵.
- (56) The procedure of switching is described under the Eligibility Decree (Articles 3-7/B) and has been somewhat changed by the recent amendment to the HGA. An eligible customer can terminate its public utility contract at any time by a written notice addressed to its previous public utility supplier. The notice terminates the public utility contract with effect on the first day of the fourth month following the notice of termination (the parties may agree on a different date). According to the parties, switching does not entail any significant costs or time investment on the part of the eligible customer. Customers that have switched to the open segment of the market are allowed to switch back to the regulated segment.
- (57) Customers that have actually switched supplier accounted for 5-6% of the total Hungarian gas consumption at the end of 2004 ([5-15%]* of the gas consumption of eligible customers)²⁶. According to MOL, this share will increase to [5-15%]* in October 2005 ([5-15%]* of the eligible customer market) as more eligible customers have terminated their public utility contract with effect from October 2005.
- (58) The old gas regime (under the old Hungarian gas act), now the regulated regime, consists of a vertical chain of exclusive supply/purchase relationships. The public utility wholesaler, MOL WMT, sells natural gas to the RDCs. The public utility

²⁵ Article 36(2) of the HGA.

²⁶ MOL presentation of 27 July 2005.

wholesaler is under an obligation, by law, to cover the full natural gas demand for public utility purposes of the RDCs, whereas the RDCs are under an obligation to source their natural gas needs for their public utility customers exclusively from the public utility wholesaler. To fulfil this obligation, the RDCs and MOL WMT have entered into long-term framework supply contracts, with duration from [...] years.²⁷ Detailed supply conditions and quantities are set in yearly contracts. The RDCs, the public utility suppliers, have in turn the exclusive right and obligation to supply the customers situated in their territory. MOL WMT also supplies directly certain large customers connected to the transmission network²⁸. The prices for the supply of natural gas and other services at the different levels of the vertical gas supply chain²⁹ are also heavily regulated³⁰.

- (59) In contrast with the public utility contracts, the relationship between the eligible customers that switched suppliers and their various possible commercial partners (traders, importers, etc.) is largely subject to the principle of contractual freedom.

Legal unbundling of the transmission network and storage facilities

- (60) Until end 2003, MOL owned and operated the entire high-pressure transmission network and all the underground storage facilities in Hungary. Since January 2004, the transportation network and the storage facilities have been legally unbundled from MOL WMT in two separate wholly-owned subsidiaries of MOL, MOL Storage and MOL Transmission respectively.

Distribution networks

- (61) The local medium and low-pressure distribution networks through which natural gas is distributed to the final customers (except those that are directly connected to the transmission network) are owned and operated by the RDCs. However, RDCs are not confined to mere distribution, since they also sell gas to eligible and non-eligible customers, as public utility suppliers and, in theory, as traders in the case of eligible customers having switched suppliers. Under the HGA, an RDC is entitled to have three licenses: distribution, public supply, and trading (on the open segment of the market). At this stage, there is thus no unbundling other than accounting unbundling between the different activities of the RDCs (distribution, supply as public utility supplier and supply as trader). In practice, however, most RDCs have set up a

²⁷ The contracts with [...] and [...] expire at [2005-2020]

²⁸ The public utility wholesaler is only entitled to supply for public utility purposes natural gas to a restricted number of customers which are listed in the licence of the public utility wholesaler.

²⁹ These services are the following: transmission, distribution, public utility storage, gas supply between the public utility wholesaler and the public utility suppliers (i.e., sales by MOL WMT to the RDCs), gas supply between the public utility suppliers, or in some cases the public utility wholesaler, and the public utility customers (i.e., sales by the RDCs or in some cases MOL WMT to residential customers and to non-residential eligible customers which have not switched suppliers).

³⁰ Pursuant to Article 48(2) HGA, the official price shall provide coverage for the costs of the assets that were part of a justified investment and the costs of efficient operation, and also the profit necessary for permanent operation. This is the so-called cost-plus principle.

separate company to be active as trader on the open segment of the market³¹, and none of the RDCs or their trading subsidiaries has any customers on the open segment of the market at this stage.

- (62) Under Directive 2003/55/EC, by July 2007 at the latest, the RDCs will have to split their activities into separate legal entities, one in charge of operation of the distribution network and the other one in charge of supply to end customers.

Licenses

- (63) It is one of the fundamental principles of the HGA that, for reasons of public interest, the performance of the gas related activities is subject to the *ex-ante* control of the HEO. The *ex-ante* control is performed by way of licensing. Under Articles 7 and 9 of the HGA, the following activities are subject to licensing: transmission (operation of the high-pressure transmission network), storage (operation of the five storage facilities located in Hungary), distribution (operation of the local distribution pipelines), trade, public utility wholesale, public utility supply (RDCs), establishment and operation of the organised gas market (gas exchange), system operation, and access to cross-border natural gas pipelines.
- (64) MOL Transmission is the transmission licensee and the system operation licensee, and MOL Storage is the storage licensee. MOL WMT holds a public utility wholesale license (for its supply of gas in the regulated segment of the market), a trading license (for its supply of gas in the open segment of the market), and two cross-border licenses (one as a gas trader, and one as a public utility supplier). The RDCs hold distribution licenses and public utility supply licenses (for their supply in the regulated segment of the market). The RDCs (or in some cases a separate subsidiary of the RDC) also hold trading licenses (for their supplies in the open segment of the market).
- (65) Thirteen entities currently have a natural gas trading licence in Hungary³². Seventeen entities currently hold a cross-border license (which is necessary to transmit natural gas through the cross-border transmission pipelines) in Hungary. These are the same entities as those holding a trading license, plus El Paso Kft., MOL Transmission, NITROGÉN MŰVEK Rt. (a customer of gas), and POGO Kft.

³¹ Édenenergia Kereskedelmi Kft., the separate joint trading subsidiary of the two RDCs of Gaz de France, ÉGÁZ and DÉGÁZ; Fővárosi Gázkereskedelmi Kft., the separate trading subsidiary of FŐGÁZ Rt. (RWE, E.ON and the Municipality of Budapest); and E.ON EK, the trading subsidiary of the E.ON group in Hungary (separate from E.ON's two gas RDCs, DDGÁZ and KÖGÁZ). TIGÁZ (Italgaz/ENI and RWE), however, holds a gas trading license itself.

³² MOL WMT, PANRUSGÁZ Magyar Orosz Gázipari Rt., Első Magyar Földgáz- és Energiakereskedő és Szolgáltató Kft. ("EMFESZ"), E.ON Energiakereskedő Kft. ("E.ON EK"), BC Energiakereskedő Kft., CENTREX Rt., DBGÁZ Kft., DUNAFERR Központi Beszerzési Kft., EURO-BRIDGE Kereskedelmi és Szolgáltató Kft., Édenenergia Kereskedelmi Kft. (a subsidiary of Gaz de France's two RDCs, ÉGÁZ and DÉGÁZ), ENERGY CAPITAL Energiakereskedő Kft., Fővárosi Gázkereskedelmi Kft. (a subsidiary of FŐGÁZ Rt.), and TIGÁZ Rt. (a subsidiary of Italgaz/ENI).

Access to the gas networks and to storage

- (66) Under the HGA, the system operator (to the extent it is necessary to ensure the stability of the system), the public utility wholesaler, the public utility suppliers, the traders, the gas producers (to the extent of their production) and the eligible customers (to the extent of their own consumption) have a right of Third Party Access (“TPA”) to the free capacities in the transmission³³, distribution³⁴ and storage³⁵ systems. Access must be granted on a non-discriminatory basis to all operators³⁶.
- (67) It is a fundamental principle pursuant to Article 30(6) of the HGA that free capacity may only be booked on the basis of a confirmed customer demand. The HGA thus expressly envisages a system whereby capacity reservation is directly linked to actual gas demand. As a consequence, capacity without underlying customer demand cannot be subject of trade on its own right. This, for the time being, excludes any secondary trading of capacity rights.
- (68) The HGA provides for a priority order in the allocation of capacities for transmission, distribution and storage of gas. Pursuant to the HGA, first the system operator for the balancing of the network, then the suppliers of residential customers and so-called “communal customers” specified in separate regulations (e.g., customers which are active in the public field of military, healthcare, education) enjoy priority over all the other infrastructure users. The exact rules regarding the customers enjoying priority are set out in the Executive Decree and Decree No. 81/2003 of the MET.
- (69) As regards the allocation of cross-border, transmission, distribution and storage capacities, the Hungarian gas regulation differentiates between (i) already allocated capacity, and (ii) free capacity, for which a new capacity booking may be requested.

³³ Article 30(1) HGA specifically obliges the transmission licensee to provide access to the free capacity of the system in its usage in return for a fee to (i) the public utility wholesaler, (ii) the traders, (iii) the eligible customers to the extent of their own usage, (iv) the natural gas producers to the extent of their gas production, and (v) the system operator to the extent that is necessary to ensure the stability of the system.

³⁴ Pursuant to Article 30(4), the distributor licensee shall provide access to the network in its usage in return for consideration to the (i) RDCs, (ii) the traders, (iii) the eligible customer to the extent of its own usage, and (iv) the natural gas producer to the extent of the gas produced by itself.

³⁵ Under Article 30(2) and (3) the storage licensee is obliged to provide access to the free capacity of the system in its usage in return for consideration to the system operator to the extent that is necessary to ensure the stability of the system. If, having fulfilled the needs of the system operator, the storage licensee still has free capacity, it is obliged to provide access on open, transparent and non-discriminatory commercial conditions in return for consideration to (i) the public utility wholesaler, (ii) the eligible customers to the extent of their own usage; and (iii) traders.

³⁶ Article 30(5) of the HGA stipulates that the conditions for access may not include any unjustified discrimination, may not give ground for any abuse, may not include any unjustified restriction and may not endanger the safety and quality of supplies. According to Article 31 of the HGA, access to transmission and distribution networks or to storage may be refused if (i) the free capacity for the satisfaction of demand is missing, (ii) the access would impede the supply of gas to priority customers, (iii) there is a serious malfunction or crisis in the co-operative gas system or (iv) the quality of the gas to be put into the system does not comply with the minimum qualitative requirements set out in the Network Code.

In accordance with Article 1(30) of the Executive Decree, the capacity which is covered by an agreement for the supply of gas (contracted or allocated capacity) is already allocated capacity, the rest is free capacity. Existing capacity demands (already allocated capacity) have priority over new demands. If the demand for free capacities exceeds the amount of free capacities actually available, the free capacities are allocated through an auction³⁷. There are special and detailed capacity booking rules for eligible customers exiting the public utility market (see below in recitals 73 to 79).

- (70) The amount of free capacities is defined on a monthly basis. MOL Transmission, the transmission licensee, is required to publish on its website the available capacities for each entry and exit point of the transmission system³⁸.
- (71) Competitors of MOL WMT and the RDCs (on the open segment of the market) have a right of TPA to the transmission and distribution networks, which are natural monopolies, at regulated tariffs³⁹. The access to storage capacities is only regulated in respect of MOL WMT as a public utility wholesaler⁴⁰ (*i.e.*, as regards the supply of households and eligible customers which have not switched to the open segment of the market). The fees for access to storage in the open segment of the market are negotiated, *i.e.* set by individual agreement between the user of the storage (including MOL WMT as a trader) and the storage licensee.
- (72) Capacities at the two cross-border entry points (Beregovo at the Ukrainian/Hungarian border and Baumgarten at the Austrian/Hungarian border) and for storage are booked (contracted) for a gas year⁴¹. Since the beginning of 2005, the amended grid code allows capacity reservation agreements for a longer duration. According to the parties, there are currently [...]*. It is also possible to book capacity for shorter (monthly) periods but the fees in this case are much higher.

³⁷ Point 5.1.3.1 (g) of the Network Code.

³⁸ Article 5.1.3.2 (a) of the Network Code. The capacities to be published are the maximum daily (in m³/day) and hourly (in m³/hour) technical capacities; the hourly and daily capacities already booked by system users; and the available capacities. They must be published 12 months in advance, in monthly breakdowns, and updated every month. The method used by the transmission licensee to determine free capacities must be approved by the HEO and is also published on the website. *See* slides 37 and 38 of the presentation of HEO “Hungarian Gas Market II”, 26 July 2005; response of E.ON to Question 4 of the request for information of 29 June 2005.

³⁹ On the open segment of the market, the system operation fee, the transmission fee and the distribution fee are normally paid by the gas trader to the system operation, transmission, and distribution licensees, and then passed on to the eligible customer by the trader.

⁴⁰ It should be noted that RDCs are not entitled to book for and obtain free capacities in the Hungarian storage system for their public utility supply (but they can book storage capacities to supply customers on the open segment of the market).

⁴¹ The gas year runs from 1 July to 30 June for transport; and from 1 April to 31 March for storage.

Customer-driven capacities along the gas supply chain

- (73) As indicated, there are special and detailed rules for capacity booking for eligible customers exiting the public utility market. The capacities used by these eligible customers in the public utility market are considered to be already allocated capacities, to which the customers remain entitled even after switching to the open segment of the market. Pursuant to Article 36(7) of the HGA and Article 3(4) of the Eligibility Decree⁴², when an eligible customer leaves the public utility sector, it is entitled to “take along” all the cross-border, transmission, distribution and storage capacities that it was using as a public utility customer⁴³. In other words, the capacities follow the customer, as long as the underlying demand of the customer subsists.
- (74) The purpose of this provision is to ensure that eligible customers are entitled to adequate background capacities from the system even after switching. The “already allocated capacities” only serve as a base demand for the capacities for eligible customers. They can vary in accordance with the actual demand of a customer (for example a customer may not want to have storage capacities, but rather to book more import capacities, or the customer’s gas consumption may increase at a later stage). These variations are treated as a demand for new capacities.
- (75) Essentially this system, the parties argue, can be described as a “customer-driven system”, that is to say that capacities (at all levels of the supply chain) automatically follow the customers switching supplier. This principle is also encapsulated, according to the parties, under Article 30(6) of the HGA and Article 32(11)-(12) of the Executive Decree which prescribes that cross-border, transmission, distribution and storage capacities may be booked, and later on held, by any licensee (or eligible customer) only on the basis of “confirmed customer demand” (or to the extent of its own demand). Article 32 (13) of the Executive Decree defines the term “confirmed customer demand” as the demand already covered by an agreement or a pre-contract (in the case of an eligible customer, it is defined on the basis of the business plan of the given customer).
- (76) The very detailed technical and administrative rules of the “customer-driven system” are contained in the Network Code (Chapter 5.1. of the Network Code). Of special relevance is the methodology for calculating for a given customer the already allocated capacity at the entry points of the transmission system (namely the storage

42 Article 3 (4) of Eligibility Decree provides as follows: “The registered eligible customer is entitled to the transmission, storage, distribution and cross-border capacity to the extent that is reserved in the public utility contract even after the termination of the public utility contract. The rules for the determination of this capacity are contained in the Network Code. This capacity is not deemed to be a demand for a new capacity reservation.” See also point 5.1.2 of the Network Code.

43 The public utility wholesale licensee (MOL WMT public utility arm) and the public utility supply licensees (the RDCs) are under an obligation under Article 32 of the Executive Decree to reduce the level of booked transmission, distribution and storage capacities with the decrease of demand as a result of eligible customers switching to gas trader licensees. This is furthermore mirrored in Article 3(5) of the Eligibility Decree which provides that the public utility wholesale licensee and the public utility supply licensees are entitled to amend, without any negative consequences, such as contractual penalties, their capacity reservation agreements with the transmission, storage and distribution licensees, if and provided that the reason for such amendment is the switching of supplier by eligible customers and thus certain capacities becoming free.

and cross-border capacities)⁴⁴. It is important to note that the basis for this calculation is the off-take (exit) capacity booked for the customer in the previous gas year, which is higher than the entry capacity booked by the public utility wholesaler for the customer as the public utility wholesaler could benefit from synchronicity, but an individual customer cannot⁴⁵. This means that the eligible customer switching to the open segment of the market is allocated import capacity equal to its off-take capacity at the exit point.

- (77) As regards cross-border capacity more specifically, Point 5.1.2 c) ii of the Network Code provides that this capacity shall be allocated as a maximum of 80% on the Beregovo entry point (East) and a minimum of 20% on the Baumgarten entry point (West). According to the parties, this 80-20 rule is designed to divide import capacities among the entry points reasonably, but respondents in the market investigation have stressed that this rule is difficult to satisfy for new entrants and constitutes a barrier to entry.
- (78) The already allocated capacity is capacity to which the customer is entitled, and which can serve as a base demand. This does not mean that the new supplier has the obligation to use the capacity to which it is entitled and which is calculated in accordance with the above-described formula. However, any other capacity request is treated as a demand for new capacity. Thus, if the cross-border capacity according to the allocation 80% Beregovo and 20% HAG does not correspond to the capacity needed where the new supplier has access to gas, the new supplier will have to request additional cross-border capacity. This request will be treated as a demand for new capacity, which has a lower priority level. This may not be so much a problem at the HAG entry point where there is some free capacity, but it is a problem at Beregovo where there is congestion.
- (79) The “capacity follows the customer” principle only applies to the allocation of the capacities used by existing customers switching to the open segment of the market, but not to the allocation of free capacities to new customers (for example, a new industrial plant consuming natural gas). As pointed out by the HEO, this is a problem for new customers without previous gas consumption⁴⁶.

⁴⁴ Point 5.1.2 of the Network Code.

⁴⁵ The synchronicity factor results from the fact that peak capacity demands at the exit points arise at different times for different customers. This means that the peak capacity at the entry point that a supplier with a large portfolio of customers must book (aggregated peak capacity of all the customers) is less than the sum of the peak capacities at booked at the exit points. For example, a synchronicity factor of 0.97 could be calculated for the 2005-2006 gas year. See slides 22-32 of the presentation of the HEO “Hungarian Natural Gas Market II” on 26 July 2005.

⁴⁶ See slide 32 of presentation “Hungarian Natural Gas Market II” of the HEO on 26 July 2005.

b. Evolution of the regulatory framework

- (80) It is not clear at this stage how the Hungarian hybrid model will evolve in the future. The HEO is expected to publish a proposal for a new model for the gas market in the fall of 2005. A new model for the electricity market was recently published for public consultation on the website of the HEO (See Electricity section below in recitals 181 to 207).
- (81) All Hungarian market players generally expect that in July 2007, when all residential customers become eligible, the current system of public utility supply (and thus the hybrid model) will disappear and be replaced with a Universal Service Provider (“USP”) concept for residential customers and some small non-residential customers which have not concluded a supply contract with a specific supplier. Such USPs would be appointed through an open competitive tender by the HEO and would have the competence to supply the relevant customers throughout Hungary at a regulated price. All other customers would be forced to enter the open segment of the market. This market model would be very similar to the HEO’s recommendation for the new electricity market model.
- (82) As a result, the public utility wholesaler function of MOL WMT and the public utility supply function of the RDCs would disappear. MOL WMT and the RDCs would operate purely as holders of trading licenses on the open segment of the market. The RDCs may also operate as USPs (if issued a USP operational license as a result of a successful tender). The obligation of RDCs to purchase gas exclusively from MOL WMT would also end.
- (83) The Commission notes that, in their reply to the SO, the parties did not challenge the description made in the SO of the future evolution of the regulatory framework for the Hungarian gas sector and its timetable. The expert report submitted by the parties notably confirms that *“The Hungarian government has disclosed its intention to remove the price cap in the natural gas sector”*.

c. The resolution of the HEO

- (84) Under Article 52 of the HGA, the HEO must approve the acquisition of a controlling shareholding in any licensed undertaking and the exercise of the associated rights. The HEO may refuse the approval or may impose conditions if the transaction would endanger the security of the natural gas supply, the performance of the licensed activities as well as the regulations applicable to the prices and quality of service in transmission, storage, distribution, system operation or public utility supply activities. The HEO may also refuse to approve the transaction if, as a result of the transaction, the licensee is not able to satisfy the requirements for licensing set out in the HGA.
- (85) On 27 June 2005, the HEO adopted a resolution approving the acquisition of certain gas businesses of MOL by E.ON, subject to eight conditions. It is only once E.ON has fulfilled these conditions (or submitted an irrevocable guarantee in respect of their fulfilment) and the HEO has adopted a second resolution approving such completion, that ERI will be allowed to exercise its shareholder’s rights.

(86) These conditions can be substantively summarized as follows:

- Condition 1: The HEO required the legal and organizational unbundling of the public utility wholesale and the natural gas trade activities of MOL WMT by 31 May 2006;
- Condition 2: E.ON is required to submit an implementation plan to the HEO regarding certain organizational changes to be undertaken at MOL WMT and MOL Storage. The HEO in particular emphasized the independence of the management of the respective companies and of certain joint services to the companies (data processing, controlling, etc.);
- Condition 3: E.ON is required to make the public utility wholesaler submit for approval and execute a programme to ensure the securing of natural gas resources and on the safety of supply in Hungary for a mid-term period. The HEO also outlined the main elements of such a programme (sufficient amounts, rules for auction, etc.);
- Condition 4: E.ON is required to ensure that the public utility wholesaler does not expand the scope of its customers directly supplied via the transmission network (excluding communal customers);
- Condition 5: E.ON and MOL Storage are required to implement a gas storage development scheme for 2005-2009, to be approved by the HEO. The HEO also required E.ON to declare by 31 May 2006 whether it undertakes the development obligations to be set out in the forthcoming development directive issued by the HEO. In case E.ON undertakes these development obligations, it will have to ensure that MOL Storage amends and submits the development plan accordingly;
- Condition 6: E.ON is required to ensure that MOL Storage will apply regulated access for all system users, i.e. also in the open segment of the market, until real competitive market situation between natural gas storages takes place, and to comply with the GGPSSO. E.ON is required further to ensure that MOL Storage amends and submits its general business terms accordingly by 31 May 2006;
- Condition 7: E.ON is required to ensure that MOL Storage revises and confirms its qualification granted by the Hungarian Mining Office, unless E.ON can ensure that the acquisition does not affect such qualifications (whereby a declaration has to be made in this regard);
- Condition 8: E.ON is required to initiate the amendment of the HEO's decision in case the decision to be issued by the Commission regarding E.ON's notification of the planned acquisition would affect the HEO's decision within 30 days after the receipt of the Commission's decision. In case the Commission's procedure is not closed by 31 March 2006 with a final and binding decision, or if the prolongation of the competition procedure significantly hinders or makes impossible the fulfilment of the obligation by E.ON, the latter may request the HEO to amend the 31 May 2006 deadline set for the fulfilment of the conditions contained in the decision.

(iii) *Relevant product markets*

- (87) In the Form CO, the parties have taken the view that the following activities are relevant to the proposed concentration, and constitute distinct product markets:
- Procurement (import and domestic production) of natural gas for onward wholesale and sale into the Hungarian market;
 - Wholesale of natural gas to the RDCs on the regulated segment of the market;
 - Sale of natural gas to eligible customers, distinguishing between (i) large power plants over 50 MW and (ii) industrial/commercial customers including smaller power plants;
 - Sale of natural gas to residential (non-eligible) customers;
 - Storage of natural gas; and
 - Transmission of natural gas.
- (88) The Commission has in the past identified the following activities as distinct product markets in the natural gas sector:
- Exploration and production;
 - Transmission (via the high-pressure pipeline grid);
 - Distribution (via low-pressure pipeline grids);
 - Storage; and
 - Trading and supply.
- (89) As regards gas supply activities, following the opening of competition of the European gas markets, the Commission has also drawn distinctions between eligible and non-eligible customers, and between customers according to their annual gas consumption and their type of activity (*e.g.*, power plants).
- (90) On the basis of the past practice and the investigation in this case, the Commission considers that the following product markets are relevant for the assessment of the present transaction:
- Gas infrastructure operations⁴⁷, including the transmission of gas, the distribution of gas and the storage of gas;
 - Supply of gas, including (i) the supply of gas to traders; (ii) the supply of gas to the RDCs; (iii) the supply of gas to large power plants; (iv) the supply of gas to large industrial customers; (v) the supply of gas to small industrial and commercial customers; and (vi) the supply of gas to residential customers⁴⁸.
- (91) This delineation of the relevant product markets in the gas sector only differs from the market delineation proposed by the parties as regard the combination of gas

⁴⁷ There are distinct infrastructures for the supply of the low-calorific gas (2/H gas) and inert gas, produced solely in Hungary, which may lead to the definition of separate product markets. However, these two qualities of gas only represent [0-5%]* and [0-5%]* of total Hungarian consumption, respectively. The Commission has therefore not further developed its analysis in this respect.

⁴⁸ The supply of gas to traders, RDCs and large customers is often referred to as “wholesale” supply, while the supply of gas to small customers is referred to as “retail” supply.

procurement and wholesale and the distinction between the market for gas supply to small industrial and commercial customers and the market for gas supply to large industrial customers. The parties did not contest the definition of the relevant product markets in the gas sector in their reply to the SO.

- (92) The market investigation has confirmed that the supply of gas to eligible customers should be further segmented in various product markets according to categories of customers due to distinct consumption profiles and supply conditions. The market investigation has shown that different categories of customers have different consumption patterns (quantities and consumption profile) and different flexibility needs. They are also characterized by different marketing approach from gas suppliers. MOL WMT itself distinguishes in its commercial and marketing organisation the following categories of customers: (i) RDCs; (ii) industrial customers; and (iii) power plants.
- (93) By contrast, the Commission investigation has indicated that the following three criteria are not relevant for market definition in this case:
- (94) First, the market investigation has confirmed the parties' view that, despite the current hybrid model, there should be no distinction between the regulated and open segments of the market. Eligible customers can easily switch back and forth between the free and the regulated segments of the market. Switching does not entail any significant costs or time for eligible customers and the recent amendments to the HGA have even made switching easier⁴⁹. Hence, the distinction between gas customers that have switched to another gas supplier and customers that remain in the public utility segment is not relevant for the definition of the relevant product markets.
- (95) Secondly, it does not appear relevant to distinguish customers depending on whether they are connected to the transmission network or to a distribution network. This makes a difference on the regulated segment of the market, as customers connected to the transmission network are directly supplied by MOL WMT, while those connected to the distribution networks can only be supplied by their local RDC. However, on the open segment of the market, traders (including MOL WMT as trader) compete to gain customers connected both to the transmission and distribution networks (and the transport and distribution fees are anyway pass-through fees for a gas supplier). While customers connected to the transmission network tend to be large or very large customers, there are also large customers connected to the distribution networks⁵⁰.
- (96) Thirdly, the market investigation has shown that prices may not be an appropriate factor to identify the distinct categories of customers, as only few customers have switched to a supplier on the open segment of the market in Hungary up to now.

⁴⁹ Pursuant to the amended Article 36 of the HGA, eligible customers can now terminate their public utility contract at any time with effect on the first day of the fourth month following, and can request their RDC or the Public Utility Wholesaler to switch back to the regulated market at any time with effect on 1 July of the following year. The parties may agree on different dates.

⁵⁰ Minutes of the meeting of 26 July 2005 with the HEO: "*Customers connected to the transmission are not that different from those connected to the distribution networks. This is more a question of location than size and industry. Some of the companies were built historically close to the transmission network.*"

Gas prices paid by different categories of eligible customers are thus still set in accordance with the categories set out in the price decrees, namely: (i) residential customers; (ii) customers with a consumption below 20 m³/hour; (iii) customers with a consumption of 20-100 m³/hour; (iv) customers with a consumption of 100-500 m³/hour; and (v) customers with a consumption exceeding 500 m³/hour.

a. Infrastructure

Transmission of gas

- (97) Consistently with previous Commission's decisions⁵¹, the parties have identified the transport of natural gas through high-pressure network of natural gas as a relevant product market. This approach has not been contested by the market investigation. Therefore, the Commission concludes that gas transmission constitutes a relevant product market for the purpose of this case. The transmission of gas constitutes a natural monopoly.

Distribution of gas

- (98) In previous decisions, the Commission has identified the distribution of natural gas through low- and medium-pressure networks as a relevant product market. The parties have not identified gas distribution as a relevant product market in their submission. However, the Commission takes the view that gas distribution constitutes a relevant product market for the purpose of this case⁵². The distribution of gas constitutes a natural monopoly.

Storage of gas

- (99) In previous decisions, the storage of natural gas has been consistently defined by the Commission as a distinct product market⁵³. The parties have also identified this activity as a relevant product market. This approach has not been contested by the market investigation. Therefore, the Commission concludes that gas storage constitutes a relevant product market for the purpose of this case.

b. Supply of gas

- (100) The procurement of natural gas for wholesale and sale into the Hungarian market which the parties have defined as a separate market is in reality the upstream activity of a gas wholesaler/importer which purchases gas from domestic or foreign producers or traders for onward sale to end users or traders⁵⁴. Procurement is therefore a pre-requisite to be active on the wholesale/retail supply of gas. This has been confirmed by the views of market players. The parties did not contest this approach in their reply to the SO.

⁵¹ See, inter alia, Commission decision of 8 October 2004 in Case COMP/M.3410 – Total/Gaz de France.

⁵² In Hungary, gas distribution networks are owned and operated by the RDCs.

⁵³ See, inter alia, Commission decision of 8 October 2004 in Case COMP/M.3410 – Total/Gaz de France.

⁵⁴ See, notably, the response of MVM to question 8 of the request for information of 3 June 2005.

Supply of gas to traders

- (101) In previous cases, the Commission has identified the supply of gas to traders as a separate product market. The market investigation has confirmed that there exists a separate product market for the supply of gas in Hungary, on which importers/producers sell gas to traders, and traders sell each other gas, for onwards supply on the open segment of the market. However, the market investigation has also indicated that, under the current regulatory framework, this market only exists marginally in Hungary, in light of the fact that (i) the open segment of the market has not developed much yet and there is little liquidity on the open segment of the market; and (ii) gas RDCs still have an obligation to purchase their gas requirements for public utility purposes exclusively from MOL WMT.
- (102) The Commission concludes that the supply of gas to traders constitutes a relevant product market for the purpose of this case.

Supply of gas to RDCs

- (103) Under the current regulatory framework, the public utility wholesaler (MOL WMT) has the exclusive right and also the obligation to supply the RDCs for their natural gas needs for public utility purposes (i.e., sales to non-eligible residential customers and eligible customers that have not switched to alternative suppliers) according to their demand. The RDCs have, in turn, an exclusive purchase obligation vis-à-vis the public utility wholesaler in respect of their natural gas demand for public utility purposes (no such exclusive purchase obligation exists in respect of the RDCs for their gas demand for the supply by them of eligible customers). Prices of the public utility wholesaler's to RDCs are regulated.
- (104) Thus, the supply of gas to RDCs constitutes a relevant product market for the purpose of this case. This market is not open to competition.
- (105) However, the gas regulatory framework is expected to change at the latest in July 2007. RDCs will be required to legally separate their supply activities and their distribution activities by July 2007 pursuant to Directive 2003/55/EC. RDCs will remain active in the supply of gas to end users as gas traders, through their trading subsidiaries already established as separate legal entities. RDCs could also be appointed as Universal Service Providers (for the supply of residential and some other small customers at regulated prices). It is expected that USPs will be free to choose their gas supplier.
- (106) Thus, under these assumptions, the market for the supply of gas to RDCs would cease to exist as a separate market from the market for the supply of gas to traders at the latest in July 2007.

Supply of gas to large power plants

- (107) The market investigation has shown that large power plants constitute a specific category of gas customers, and that the supply of gas to large power plants is a distinct product market.
- (108) Two types of gas-fired power plants may be distinguished. Conventional gas-fired power plants only produce electricity, and emit the heat created as a by-product of

electricity generation into the environment through cooling towers, as flue gas, or by other means. Cogeneration plants (or “combined heat and power” (CHP) plants) simultaneously produce electricity and heat. Cogeneration plants capture the excess heat for domestic or industrial heating purposes, either very close to the plant, or distributed through steam pipes to heat local housing (“district heating”). A cogeneration plant cannot produce heat without electricity and vice versa.

- (109) “Combined cycle gas turbine” (“CCGT”) plants can function as a conventional power plant (in which case the heat is only re-used to improve the efficiency of the power generation process) or as a cogeneration plant (in which case, the heat is used partly to improve efficiency of the power generation process and partly for domestic and industrial heating purposes as a cogeneration plant).
- (110) The consumption size and consumption profile of conventional and cogeneration power plants are similar. The main difference is that it is the demand for heat that is driving the generation of electricity in cogeneration plants, i.e. cogeneration plants are driven by the consumption of heat by the network, while electricity demand determines the operation of conventional power plants.
- (111) The market investigation has clearly indicated that large power generators constitute a customer category with unique demand requirements in terms of gas quantities and consumption patterns. In particular, according to Magyar Villamos Művek Rt. (“MVM”), the electricity public utility wholesaler in Hungary:

*MVM: “The gas consumption of power plants is much more significant than the consumption of any other eligible customer. They have a different consumption profile too. Cogeneration plants (heat/electricity production) have important peaks in winter and low consumption in the summer. The conventional power plants involved in the system balancing have also various consumption features within the same day.”*⁵⁵

- (112) Large power plants are the largest consumers of natural gas in terms of quantities. For example, the Dunamenti plant of Electrabel consumes [1-1.5] bcm of gas annually, which alone represents [10-15%] of the total Hungarian gas market. In addition, fluctuations of their demand are very high and reflect the variations in the power plants’ level of activity.
- (113) The market investigation has shown that since the opening of the Hungarian gas market to competition none of the large power plants has been able to find alternative suppliers to MOL WMT or their local RDC on the open segment of the market. This is due to the fact that their gas consumption is so large that it is not possible at this stage to purchase such large quantities of gas on the Hungarian free gas market (under the current regulatory framework, it is also not possible for large power plants to switch to the open segment of the market for only part of their needs). This is even more so for the power plants which provide balancing energy (the Electrabel Dunamenti, ATEL and AES power plants) and for cogeneration plants whose consumption is even more variable and cannot be predicted.

⁵⁵ Response of MVM to Question 11 of the request for information of 3 June 2005 (free translation).

- (114) Suppliers of large power plants must be in a position to ensure the security of supply for a long term (power plants' gas supply contracts are [...]*) and they need a critical size to be able to bear the huge variations in consumption of these power plants. EMFESZ notes that it is very difficult to supply power plants as they are regulated by the Hungarian electricity dispatcher. Their gas consumption is very variable: it may go from 100,000 m³ one hour to 20,000 m³ the next hour, and then 50,000 m³⁵⁶.
- (115) The parties have proposed to distinguish between large and small power plants on the basis of a 50 MW threshold for installed electricity production capacity. While the market investigation has suggested that this criterion (which is based on the different licensing requirements for large and small power plants⁵⁷) may be artificial, it has not provided indications that alternative criteria (such as the actual gas consumption of the power plants) may be more appropriate to distinguish large and small power plants. Therefore, the Commission takes the view that the supply of gas to large power plants with an installed electricity production capacity above 50 MW is a relevant product market for the purpose of this case.

Supply of gas to large industrial customers

- (116) The market investigation has revealed that it is relevant to distinguish between small and large industrial customers, due to distinct consumption profiles and commercial relationships. In particular, the category of large customers is specifically targeted by new entrants⁵⁸. In view of the current stage of development of the Hungarian gas market (with very few customers that have actually switched suppliers), the most appropriate consumption threshold to delineate large and small industrial customer is not clear-cut. However, market players have suggested that large customers are those with an hourly consumption exceeding 500 m³/hour (which corresponds to an annual consumption of close to 2 million m³). According to these respondents, customer with hourly consumption above 500 m³/hour have a more "sophisticated" relationship with their gas supplier, which implies for instance a different daily nominations regime and different flexibility clauses. Such large customers are usually attended by key account managers.
- (117) In any case, small power plants (conventional plants and cogeneration plants) as well as other heat producers (using gas-fired boilers) should belong to the category of large industrial customers. Most industrial customers using gas in their industrial process are also considered as large customers in view of the importance of their gas purchases.

⁵⁶ Minutes of the meeting with EMFESZ of 28 July 2005.

⁵⁷ Article 51 of the Hungarian Electricity Act required a license to establish and operate power plants with a capacity exceeding 50 MW, although but this difference will partially disappear following the recent amendments of the HEA which will also apply a similar licensing requirement to plants over 0.5 MW.

⁵⁸ [...]*; a third party active in gas has also indicated that "*We are targeting mainly large industrials and power plants because they are the most prepared clients for the free gas market (capability of nomination, daily consumption management, etc.) and they are the most demanding customers who request from their GDC free market offers as well. Large clients are specific customers with specific interests and demand; it is not possible to standardize their offers.*"

- (118) The Commission concludes that the supply of industrial gas customers with an hourly consumption over 500 m³/hour constitutes a separate relevant product market for the purpose of this case. While the consumption threshold of 500 m³/hour is most appropriate on the basis of the information available to the Commission, it may be subject to changes with the further opening of the gas supply markets.
- (119) In their reply to the SO, the parties did not contest the existence of a specific relevant product market for the supply of gas to large industrial customers.

Supply of gas to small industrial and commercial customers

- (120) In view of the above market definition for large industrial customers, the supply of gas to industrial and commercial customers with an hourly consumption below 500 m³/hour constitutes a separate relevant product markets for the purpose of this case.
- (121) From a supplier's perspective, there are a number of specificities in supplying these customers. The large number of locations and customers requires customer portfolio management tools. Suppliers develop standardized general offers for these customers as well as special offers such as dual offers for electricity and gas. Brand image plays a more important role for small industrial and commercial customers and they are generally less inclined to switch suppliers⁵⁹.

Supply of gas to residential customers

- (122) In previous decisions, the Commission has defined a separate product market for the supply of gas to residential customers. Under the current regulatory framework in Hungary, residential customers are not yet eligible and can only purchase gas from their local RDCs at regulated prices. Therefore, the supply of gas to residential customers constitutes a relevant product market for the purpose of this case. This market is not yet open to competition.
- (123) When residential customers become eligible, in July 2007, it is unclear at this stage whether they will be part of the same product market as small industrial and commercial customers or whether they will be part of a distinct relevant product market.
- (124) In any case, for the purpose of this case, the question of whether gas supply to residential customers will constitute a distinct product market in 2007 or whether residential customers will belong to the same product market as other small industrial and commercial customers can be left open.

(iv) Relevant geographic markets

- (125) The parties submit that all affected markets are national in scope, with the exception of the market for the supply of gas to residential customers which is sub-national (i.e., a specific region in Hungary) in scope. The market investigation carried out by the Commission has broadly confirmed this approach. The market investigation has

⁵⁹ See notably EDF response to questions of the Commission of 11 August 2005.

nevertheless shown that the market for the supply of gas to residential customers will also be national when residential customers become eligible in July 2007.

a. Gas infrastructure

Transmission of gas

- (126) The Hungarian gas transmission network is owned and operated by MOL Transmission at the national level. Therefore, the market for gas transmission is national in scope.

Distribution of gas

- (127) The Hungarian gas distribution networks are owned and operated by the RDCs. Therefore, the gas distribution market is sub-national in scope and each of the distribution grid regions constitutes a relevant geographic market.

Storage of gas

- (128) The parties submit that the market for gas storage is national in scope due to the existing regulatory framework and the organisation of the storage facilities at the national level. Although some respondents to the market investigation have highlighted that storage services for gas wholesale or retail activities in Hungary could technically be provided by storage operators located in neighbouring countries, the market investigation has also shown that the limited availability of cross-border pipelines⁶⁰ anyway makes the use of foreign gas storage facilities difficult for Hungarian operators under current market conditions⁶¹.
- (129) This is confirmed by the fact that market players currently active in gas supply only use exceptionally gas storage facilities in foreign countries. In 2003, MOL WMT used only [450-700]* million m³ of gas storage in Ukraine (Bogorodscany), compared to [2-5]* bcm in Hungary. EMFESZ does not use gas storage facilities outside of Hungary.
- (130) The Commission therefore concludes that the geographic scope of the gas storage market is indeed national in scope. The Commission notes that the geographic scope of the gas storage market may become broader than national with the further liberalisation of the European gas markets.

⁶⁰ As already indicated, capacities booked by MOL WMT for the gas year 2004/2005 were [10-12]* bcm/year and [25-35]* million m³/day (out of 15.01 bcm/year and 41.3 million m³/day) at Beregovo and [1-4]* bcm/year and [6-10]*million m³/day out of 4.5 bcm/year and 12.3 million m³/day at the HAG entry point. In addition, a transit capacity of [3-6]* bcm/y and [10-13]* million m³/day are booked at the Beregovo entry point by the Serbian company Nis and the Bosnian Herzogovinan company BHGas for transit.

⁶¹ Market players using gas storage in foreign countries would have to import more gas in peak period, which might prove difficult in view of the limited available capacity at entry points in Hungary.

b. Supply of gas

Supply of gas to traders

- (131) The parties submit that this market is national in scope. According to the parties, companies active on the market for the supply of gas purchase gas from foreign or domestic gas producers (or their intermediaries) for onward sale in Hungary. Thus, the relevant geographic market is defined by the destination of the product, which is the Hungarian gas markets⁶².
- (132) During the market investigation, some respondents have stressed that gas is procured by MOL WMT and EMFESZ from international companies (such as Gazprom, E.ON, GDF, etc.) and is commonly traded at the European level, including Russia. Therefore, the supply side (procurement) of the wholesale supply of gas is clearly international in scope. This activity is however carried out for Hungarian market players which source gas for onward sale in Hungary and pursuant to the regulatory framework set in the HGA. Competition is therefore taking place at the Hungarian level, as gas imported into Hungary is not re-exported⁶³ and is solely intended to meet Hungarian demand.

E.ON⁶⁴: “It is important to note that there are no exports from Hungary to third countries (...). The natural gas that enters Hungary serves import purposes.”

- (133) The market investigation has clearly confirmed the parties’ views. Accordingly, the Commission agrees with the parties that the geographic scope of the market of gas supply to traders is national.

Supply of gas to RDCs

- (134) Under Hungarian law, RDCs have to procure gas for public utility purposes from the public utility wholesaler, MOL WMT. The market for gas supply to the RDCs for public utility purposes is therefore national in scope.

Supply of gas to large power plants/large industrial customers/small industrial and commercial customers

- (135) The parties’ view is that the market for the supply of natural gas to eligible customers is national because (i) there are no restrictions as to the territories where an eligible customer may purchase its gas needs from when switching from its RDC, and for customers remaining with their respective RDCs, conditions of competition are regulated and similar across Hungary; (ii) there is a regulated access to the entire network in Hungary, which customers and traders may access from any exit point all around Hungary; and (iii) traders are in fact active in approaching customers located all around Hungary, regardless of the location of the customers and gas transport in Hungary is governed by a “stamp tariff system” (i.e., the cost of transport is always

⁶² Form CO, p. 110

⁶³ Except gas transit.

⁶⁴ Form CO, p. 96.

the same independently of the distance of the transport and the location of the customer).

- (136) This approach is consistent with the Commission's previous decisions⁶⁵, which generally considered the various markets for the supply of gas as national in scope. The market investigation has also confirmed that under the current regulatory framework competition takes place at a national level for eligible customers. The regulation is national, in particular as regards TPA to the transmission and distribution networks and to storage facilities. Traders do not privilege any specific geographic area within Hungary. As regards access to the transmission network in particular, Hungary constitutes a single balancing zone and under the new entry/exit fee system (introduced in July 2005 to replace the stamp tariff system), the tariff is the same for all points in Hungary. A third party active in the gas sector has stated:

“The applicable regulation allows eligible customers that have decided to exit the regulated market to choose their supplier, and the latter can conduct its business in the whole country. Moreover, conditions of access to the transmission network are the same all over the country and prices are established at the national level. The supply of gas to eligible customers is therefore a nationwide business.”

“Due to the different transformation levels of the liberalisation directives into national laws different national regulatory frameworks do exist. These different regulatory frameworks have an impact on access to transport/distribution networks, to storage facilities and of course lead to different price levels in different European States.”

- (137) After 2007, neither the parties nor the market investigation have provided any indication that the markets for supply of gas to eligible customers would become broader.
- (138) In conclusion, the different markets for the supply of gas to the three categories of eligible customers mentioned above (large power plants; large industrial customers; and small industrial and commercial customers) are national in scope.

Supply of gas to residential customers

- (139) Under Hungarian law, residential customers are obliged to procure gas from their local RDC and are not entitled to switch to traders on the open segment of the market. Therefore, the geographic scope of the market for the supply of gas to residential customers is sub-national in scope and each of the distribution grid regions constitutes a relevant geographic market.
- (140) After 2007, residential customers will be able to switch suppliers. The market for the supply of gas to residential customers will therefore acquire a national dimension for the same reasons as the other markets for the supply of gas to end users. The market investigation has largely confirmed this⁶⁶.

⁶⁵ Case COMP/M.3440 ENI/EDP/GDP.

⁶⁶ “As soon as residential customers will become eligible, this regional approach will end, as the customer will be able to decide which supplier / trader he/she should sign up”, Pannonpower's reply to the Commission's first phase questionnaire.

Conclusion on relevant markets in the gas sector:

- (141) The Commission has assessed the impact of the proposed transaction on the following gas markets:
- Gas infrastructure operations:
 - (i) Transmission of gas in Hungary,
 - (ii) Distribution of gas in the Hungarian RDCs' areas,
 - (iii) Storage of gas in Hungary,
 - Supply of gas:
 - (i) Supply of gas to RDCs in Hungary,
 - (ii) Supply of gas to traders in Hungary,
 - (iii) Supply of gas to large power plants in Hungary,
 - (iv) Supply of gas to large industrial customers in Hungary,
 - (v) Supply of gas to small industrial and commercial customers in Hungary,
 - (vi) Supply of gas to residential customers in the Hungarian RDCs' areas.

B. Relevant electricity markets

(i) The electricity sector in Hungary

a. Electricity demand

- (142) Hungarian electricity consumption increased from 38.6 TWh in 2000 to 41.2 TWh in 2004, a 1.6% compounded annual growth rate. In 2004, the largest end users sectors were manufacturing (30%), residential (27%) and transports (5%). According to the parties⁶⁷, electricity consumption in Hungary is expected to increase by [0-5%]* annually in the coming years. Electricity sold in Hungary is either produced by domestic power generators or procured from imports.

b. Electricity transmission and distribution

- (143) MVM owns and operates the Hungarian high-voltage electricity grid. The low-voltage grids are owned and operated by the RDCs. There are six electricity RDCs in Hungary (TITÁSZ, ÉDÁSZ, DÉDÁSZ, ÉMÁSZ, ELMŰ, DÉMÁSZ). E.ON has sole control of three of these six RDCs: TITÁSZ, ÉDÁSZ and DÉDÁSZ. Out of the three remaining RDCs, ÉMÁSZ and ELMŰ are controlled by RWE and DÉMÁSZ by Electricité de France (“EDF”). ELMŰ is the largest electricity RDC in Hungary as it covers the Budapest area.

Ownership of the electricity RDCs:

ÉDÁSZ	100% E.ON
DÉDÁSZ	100% E.ON
TITÁSZ	100% E.ON
DÉMÁSZ	61% EDF 20.6% Institutional investors 18.4% Others
ÉMÁSZ	54.3% RWE 26.8% EnBW 18.9% Others
ELMŰ	55.3% RWE 27.3% EnBW 10.5% Municipality 6.9% Others

- (144) The graph below shows the electricity RDCs’ respective territories and sales in 2002:

⁶⁷ Form CO, Page 192

c. Electricity generation

Current electricity generation capacities in Hungary

- (145) Total generation capacity in Hungary was approximately 8,000 MW in 2004, to be compared with the country's peak load of 6,350 MW. The Hungarian electricity generation is split between nuclear energy (1,800 MW installed capacity) and lignite, gas and coal power plants (5,700 MW installed capacity)⁶⁸. Renewable energies and hydro power are negligible. This generation mix differs slightly from neighbouring countries, where nuclear energy (Slovakia) or hydro power (Austria, Serbia, Romania) play a more significant role.
- (146) In 2003, 18 power plants had a generation capacity exceeding 50 MW, compared to 13 in 1997, while there are around 150 smaller power plants, compared to 50 in 1997. Almost 40% of electricity consumed in Hungary is generated by the Paks nuclear power plant, the remaining 60% is mainly generated by power plants burning coal and hydrocarbons and by imports.
- (147) The Hungarian power plants may be ranked according to their variable costs ("merit order curve"). The first power plant is the nuclear plant (with variable costs below [0-10]* EUR / MWh), followed by the lignite power plant (around [15-30]* EUR / MWh). The most expensive power plants are the gas-fired power plants⁶⁹ (from [15-40]* EUR / MWh to [15-40]* EUR / MWh) and the coal power plants (above [...] EUR / MWh). The following chart, drawn from the Form CO, shows the merit order curve of Hungarian power plants in 2003:

⁶⁸ Further details on the structure of electricity generation in Hungary are provided in Section V.(ii).a.

⁶⁹ It should be noted in the chart above that gas/oil power plants are using gas as primary fuel.

[...]*

- (148) Electricity generation capacities available for the open segment of the market are much lower than total installed capacities due to the existence of long-term Power Purchase Agreements (“PPAs”). According to the HEO, the capacity available for the open segment amounted to around [3,000-4,000] MW in 2005.
- (149) Capacities contracted by MVM under the long-term PPAs in excess of its needs as public utility wholesaler and auctioned by MVM may be added to this figure. At the last auction for the period between 1 July 2005 and 31 December 2005, MVM sold 85 MW of base load capacity, 190 MW of off-peak capacity and 54 MW of peak capacity to electricity traders.

Need for additional generation capacity

- (150) The Commission’s market investigation has revealed that the Hungarian generation capacity will need to be renewed and expanded to a large extent in the next few years. Starting in 2007, the peak load will no longer be covered by installed capacity and imports, showing the need for investment in electricity generation as of 2007. According to MAVIR Rt. (“MAVIR”), the electricity system operator, the electricity market could even experience a deficit of production capacity around 2010 due to the lack of sufficient new generation capacity planned and the long time needed for new power plant projects.
- (151) The HEO and MAVIR estimate that new generation capacity of approximately 5,000 MW has to be built until 2020 in Hungary to replace old power plants⁷⁰ (3,500 MW) and to satisfy the increase in demand. This figure accounts for roughly 60% of the total production capacity currently installed in Hungary. Accordingly the Hungarian electricity generation capacity should increase from 8,000 MW to approximately 10,500 MW. This estimate is also consistent with expectations from large market players which have estimated that half of the generation capacity in Hungary (approximately 4,000 MW) will need to be replaced in the next 5 to 7 years.

d. Electricity exports/imports in Hungary

- (152) In view of the limited domestic generation capacities available for the open segment of the market, imports have developed rapidly to supply the open segment. MAVIR is responsible for granting non-discriminatory access to cross-border capacities.
- (153) Hungary has a relatively high interconnection capacity with neighbouring countries, with 6 interconnectors. Import capacity amounts to approximately 3,000 MW, representing 38% of installed generation capacity in Hungary (by way of comparison with the most integrated regional electricity market in Europe, Nordpool, these figures are 18% for Norway, 29% for Sweden, 50% for Denmark, and 14% for

⁷⁰ A number of old coal-fired power plants have already been decommissioned in Hungary and most of the remaining ones are expected to close down for environmental reasons.

Finland)⁷¹. The cross-border power lines enable transmissions from and to Ukraine, Slovakia, Austria, Croatia, Serbia and Romania.

- (154) Some of these interconnections are not actually used for imports as there are either no or no cheaper electricity sources from some of Hungary's neighbouring countries. For example Serbia is a net importer following the destruction of the country's infrastructures in the war, and only one power plant in Ukraine is allowed to export electricity for technical reasons related to the stability of the Ukrainian electricity system. By contrast, all the import capacity for cheaper electricity (namely the Slovak interconnector) is fully used and congested.
- (155) New interconnection lines with Croatia, Slovakia and Romania are planned by MVM in 2007. However, they are not expected to lead to a significant increase in electricity imports into Hungary due to the reduction of Hungary's electricity generation capacity surpluses.

e. Development of the liberalised electricity markets in Hungary

- (156) The proportion of customers (in volume) purchasing electricity on the open segment of the market increased steadily from 2003 to 2005: approximately 3% on February 2003, 7% on February 2004 and 27% on February 2005. In June 2005, 1,129 eligible customers (1,530 consumption sites) had switched to the open segment, accounting for 10.5 TWh of annual consumption. Accordingly, the open segment represented 31.8% of the total electricity market.
- (157) According to statistics from the HEO, electricity end users on the open segment are mainly base load or "profile customers", for which the electricity consumption schedule is easily determined based on past statistics. These customers are active in various industry sectors (energy, chemicals, steel, food industry, retail, etc.). The market investigation has shown that most electricity market players consider the open segment of the electricity market in Hungary as competitive, while replies from electricity customers are mixed.

⁷¹ European Commission: "Annual Report on the Implementation of the Gas and Electricity Internal Market", 5 January 2005.

Development of the electricity free market from 2003 to March 2005:

Source: MAVIR Presentation, May 2005

(ii) *Regulatory framework*

a. Current regulatory framework

(158) The liberalisation process started earlier in the electricity sector than in the gas sector, with the old electricity act in 1994 (Act 48 of 1994), the privatisation of the regional distributions companies (“RDCs”) in 1995, and the entry into force on 1 January 2003 of the Hungarian Electricity Act (Act 110 of 2001 – “HEA”) adopted to implement Directive 92/96/EC of the European Parliament and of the Council of 19 December 1996 concerning common rules for the internal market in electricity⁷². Further measures were adopted to implement Directive 2003/54/EC of the European Parliament and of the Council of 26 June 2003 concerning common rules for the internal market in electricity and repealing Directive 96/92/EC⁷³ into Hungarian law. A law amending the HEA (Act 79 of 2005) was adopted on 6 July 2005 and entered into force on 1 September 2005, and a proposal for a new organization of the Hungarian electricity market was published by the HEO on June 2005 (“New Electricity Model”)⁷⁴.

⁷² , OJ L 27, 30.1.1997, p. 20.

⁷³ , OJ L 176, 15.7.2003, p. 37.

⁷⁴ Proposal for the Modification of the System of Market Relations of the Hungarian Electricity Market in order to Enhance the Efficiency of the Competition to Attract Consumers and to Achieve the Required Full Compliance with Relevant Community Directives, June 2005, http://www.eh.gov.hu/gcpdocs/200506/honlaprateljes2005jnius27_angol.pdf.

Coexistence of regulated and open segments

- (159) As the gas market, the Hungarian electricity market is also characterized by a hybrid model, including a regulated segment and an open segment of the market. Before the liberalisation of the electricity market in Hungary, cross-border electricity trading and transmission fell by law within the exclusive monopoly of MVM, a wholly-owned state company. Six regional suppliers had a monopoly to provide electricity services to customers in their respective regions.
- (160) On 1 July 2004, all non-residential customers became eligible customers⁷⁵. Residential customers will become eligible on 1 July 2007. As in the gas sector, eligible customers have the right, but not the obligation to switch suppliers, and may thus stay with their respective regional supplier in the context of a public utility contract. There are however more customers that have switched to the open segment of the market in the electricity sector than in the gas sector.
- (161) Recent amendments of the HEA have made switching between public utility supply and open segment easier. For example, electricity customers can switch in 30 days if the contract does not specify it differently and can switch back to public utility supply in 60 days.
- (162) The same chain of supply/purchase obligations exist in the public utility electricity sector as in the gas sector. Similarly, the relationships within the framework of public utility contracts remain, for reasons of public interest, heavily regulated both in terms of the applicable prices as well as other conditions of the contracts that are to be concluded among the various market players. By contrast, contractual freedom principally prevails in respect of the commercial relationship of eligible customers, having switched their supplier, and their commercial partners (traders, importers etc.).

Tariffs

- (163) Electricity prices applicable in the public utility segment are regulated. Under Article 95 HEA, the prices of the following electricity products/services are regulated: (i) the transmission and distribution of electricity, (ii) the grid control by the system operator, (iii) the electricity sold by the public utility wholesaler to the public utility suppliers (the RDCs); and (iv) the electricity sold to public utility customers.
- (164) Article 96 HEA states that the detailed rules pertaining to the tariff regime shall be drawn up by the HEO based on the least cost principle. The framework of the price regulations and the prices shall be determined by the MET. The HEO also has the

⁷⁵ Article 3 of Government Decree No. 181/2002 on the eligibility of electricity customers.

obligation to review the price levels and the prices at the request of any interested party and shall make public the results of such review.

Market operators

(165) As in the gas sector, all electricity-related activities are subject to the *ex-ante* control of the HEO, through licensing, namely: (i) construction and operation of power plant with an output over 0.5 MW; (ii) transmission; (iii) distribution; (iv) grid operation (or system operation); (v) trading; (vi) public utility wholesale; (vii) public utility supply; (viii) operation of a power exchange; and (ix) cross-border transmission of electricity.

- Generators

(166) There are currently 19 licensed electricity generators in Hungary. According to the recent amendments of the HEA, power generators having a capacity between 0.5 MW and 50 MW are now also required to obtain a license, which can be requested under a simplified procedure.

(167) The generators are obliged by law to offer their production capacity contracted for public utility purposes to the public utility wholesaler (MVM)⁷⁶. As result, the licensed generators and MVM have entered into PPAs, under which mutual selling and purchasing obligations were established on a long-term basis. The PPAs specify, inter alia, the annual capacity payment for generation capacity booked by MVM, the energy payments and the penalties for non-availability. PPAs are typically concluded for a period of twenty years.

(168) Under a PPA, the share of the generator concerned in MVM's total demand for the public utility segment is estimated and fixed in advance for the duration of the contract. The generator is obliged to reserve that production capacity and to supply the corresponding amount of electricity when requested. MVM, in turn, is obliged to remunerate the entire booked capacity, even if it is not used. MVM has therefore an economic interest to use all the capacities booked. The purchase prices for electricity are pre-fixed in the PPAs and are based on each generator's cost structure (fixed and marginal costs). The PPAs are scheduled to terminate between 2010 and 2015.

(169) As a result, the large majority of Hungarian power plants have long term PPAs with MVM, which cover a substantial part of Hungarian electricity needs. In 2003, capacities covered by the PPAs amounted to 4,800 MW out of 8,000 MW of installed capacity in Hungary, in comparison with a peak load of 6,300 MW and a base load of 3,500 MW.

- The public utility wholesaler

(170) The single-buyer public utility wholesaler MVM is obliged to supply electricity to the public utility suppliers (the RDCs) for public utility purposes (i.e. the electricity they need to supply their respective public utility customers). Article 65 HEA grants MVM an exclusive right to receive the "contracted electricity" of power plants under

⁷⁶ Article 17 of the HEA.

the long-term PPAs⁷⁷ concluded with the licensed power generators. PPAs may also be concluded between MVM and licensed importers⁷⁸.

- (171) The price of electricity sold by power generators was an official maximum price set by the MET until 1 January 2004 but is now freely negotiated between market players. The long-term PPAs contain complex price formulas for the calculation of prices. By contrast, the maximum price of the electricity sold by MVM to the RDCs continues to be regulated by the MET upon a proposal of the HEO.
- (172) Where the generation of electricity is requested but is subsequently not used by MVM in due time, the generator is allowed to sell that electricity freely or to assign it to MAVIR, the system operator⁷⁹. In practice, however, MVM has an economic interest in exploiting and reselling (domestically or by export) all booked capacities.
- (173) Small power plants without a long-term PPA with MVM, as well as other power plants with a long-term PPA with MVM beyond the quantities contracted under those, are free to sell their electricity output to any party, such as a trader or directly to eligible customers. There are, however, only limited capacities, beyond those booked under long-term PPAs, for such free sales.

- Public utility suppliers (RDCs)

- (174) The RDCs are, within the geographic territory specified in their licence, exclusively entitled and obliged to sell electricity to the public utility customers at a price determined by law. As in the case of gas RDCs, the electricity RDCs are the distribution grid licensees, but their activity is not confined to the mere distribution of electricity as they also sell electricity to eligible and non-eligible customers as public utility suppliers and in some cases as traders (in the case of eligible customers having switched to the open segment of the market).

- The system operator

- (175) The system operator, MAVIR, is responsible for the management and operational safety of the Hungarian power grid, as well as the functioning of the electricity market.

- The transmission and distribution network operators

- (176) The transmission network is owned and operated by MVM, and the distribution grids are owned and operated by the RDCs. These market players are obliged to provide Third Party Access (“TPA”) to the networks without discrimination, at regulated tariffs.

⁷⁷ The PPAs are typically concluded for a period of 20 years, although shorter durations for certain plants are possible.

⁷⁸ Article 3 (23) of the HEA.

⁷⁹ Article 18 of the HEA and Government decision No 1070/2005 of 8 July 2005.

- *Traders*

- (177) The licensed electricity traders are entitled to purchase electricity from the generators, other traders, the public utility wholesaler (if the latter has surplus electricity) and from abroad, and they are entitled to sell electricity to eligible customers, other traders and the public utility wholesaler. There are currently 23 licensed electricity traders in Hungary⁸⁰.

Imports of electricity

- (178) There are no legal restrictions on the volumes that electricity traders may import⁸¹. The other licensees are limited as to the volumes of cross-border transmissions permitted (e.g. an eligible customer may only import electricity to the extent of its own consumption pursuant to Article 46(3) HEA⁸²).
- (179) The allocation of cross-border capacities is performed and administered by the grid operator, MAVIR. Existing capacity demands (already allocated capacity) have priority over new demands. The amount of free capacity is defined on a regular basis for each cross-border power line. If the demand for free capacities exceeds the amount of available free capacity, the free capacities are allocated through an auction. Auctions are held on a yearly and monthly basis. Currently, cross-border capacity auctions are essentially used to allocate capacities at the Slovak interconnector, where demand is the most important due to lower electricity prices.

Co-generation power plants

- (180) Article 3 (19) HEA defines “co-generated electricity” as electricity produced with heat in the same generating installation⁸³. The operation of co-generation power plants is regulated by the HEA and its Executive Decree. According to the newly enacted Article 19 HEA, the use of renewable sources and waste power generation, as well as the use of co-generated electricity shall be endorsed by the state. The MET Decree 56/2002 of the Regulation on Taking-Over and Definition of Prices for Electric Energy Coming under the Feed-in Obligation provides detailed rules on the

⁸¹ Article 42(1) of HEA.

⁸² Article 44(1) as regards the public utility wholesaler.

⁸³ The additional conditions providing that co-generated electricity shall be produced with heat using identical fuels and by an energy conversion process with an efficiency of no less than 65% have been deleted by the latest amendment of the HEA.

mandatory take-over of electricity produced through co-generation as well as the definition of take-over prices. Subject to certain conditions, the public utility wholesaler is obliged to take over the co-generated electricity from power plants connected to the grid and receive subsidies from the system operator for these purchases.

b. Evolution of the regulatory framework

The New Electricity Model

- (181) The market investigation has focused on the evolution of the Hungarian electricity sector regulatory framework. The most relevant document in this matter is the New Electricity Model prepared by the HEO at the request of the MET. The proposal recently released by the HEO presents the objectives set by the MET and describes a recommended new market model. The Commission has discussed the content of this proposal and the likelihood of the adoption of its main elements with the HEO and the MET.
- (182) The objective of the Hungarian government is to bring the New Electricity Model into force at the complete liberalization of the Hungarian electricity markets.
- (183) In the absence of additional information about the future electricity model in Hungary, the Commission takes the view that it can base its forward looking competitive assessment of the proposed transaction on the current regulatory framework until July 2007 and on the recommended new market model as described in the New Electricity Model thereafter⁸⁴.
- (184) The objectives of the New Electricity Model, as set by the Hungarian government, are threefold. The first objective is to bring the Hungarian legal provisions into full compliance with Directive 2003/54/EC. The second aim is to increase competition on the electricity market to the benefit of end user customers, while preserving regulated prices for household customers. Finally, the third objective is to ensure high security of supply and to promote energy saving and environmental protection. Contrary to the current hybrid model, the New Electricity Model is a free market model with retail supply at a regulated price in a limited scope specified by law.

- Significant Market Power trader and Universal Service Provider

- (185) Under the recommended new model, the current system of public utility should be terminated and the public utility wholesale and the public utility service providers' functions should cease to exist. MVM and the RDCs would be able to continue their activities on the open segment of the markets respectively as a Significant Market Power Trader (SMP trader) and as Universal Service Providers (USP). As most significant change concerning the relation between market players, the obligation of RDCs to purchase electricity from MVM would disappear. USP should be allowed to procure electricity from any market player, at a competitive price.

⁸⁴ The recommended new market model as described in the New Electricity Model will most likely be implemented in July 2007.

(186) In order to correct the structural disparities and to support the emergence of competition, the HEO plans to introduce a special regulatory regime applicable to dominant market players. Under this regime, the HEO would have the power to impose additional obligations (e.g. mandatory capacity auctions, price control, supply obligations) in order to prevent abuse of dominant position from any SMP trader at the wholesale or the retail level.

- End users

(187) Under the New Electricity Model, regulated prices for industrial and commercial customers would terminate.

(188) Household customers would be granted the possibility to purchase electricity on the free market after 1 July 2007 but regulated prices should be maintained for those customers as a public utility service. Household customers would not be able to switch back to the regulated price service once they have switched to the open segment of the market.

- Power generators and electricity markets

(189) The obligatory capacity purchase currently present in the HEA should cease to exist and large power generators would not be obliged to reserve the most significant part of their capacity and electricity production to MVM anymore, unless they are required to do so under an existing long-term PPA with MVM.

(190) MVM would be entitled to sell on the open segment of the market the capacity and electricity purchased on the open segment of the market or through the long-term PPAs. Power generators would be entitled to sell on the open segment of the market capacity and electricity in excess of the quantities contracted in the long term PPAs and the capacity and electricity contracted in the long-term PPAs but not taken over by MVM.

(191) The recommended model foresees the establishment of two markets for the sale of electricity and capacity. An organized market should be established by a state owned Market Operator (a subsidiary of MAVIR) for hourly day-ahead trading. A “market” for bilateral transaction should also be available and will consist in (i) a set of Over The Counter transactions (“OTC market”) between power generators (to the extent of their free capacity) and traders and (ii) the sale of generation capacity released on mandatory auctions by MVM.

The evolution of the PPAs and of the electricity markets

(192) The functioning of the recommended new model will depend on the outcome of the long-term PPA renegotiations.

- The renegotiations of the PPAs

(193) In 2002, in the context of Hungary’s entry in the European Union, the Hungarian government issued a decree⁸⁵ on the determination and management of stranded

⁸⁵ Government Decree 183/2002.

costs, which entitled MVM to recover stranded costs and introduced at the same time imposed an obligation for MVM to renegotiate the PPAs before 31 January 2003. In accordance with those provisions, a round of renegotiations of the PPAs between MVM and the 10 power generators concerned took place in February 2004. This round of renegotiations failed as none of the parties involved appeared to have any interest in changing the existing PPAs. It is not likely that the government will impose a new round of renegotiations in the short term.

- (194) However, in parallel to the elaboration of the new electricity model, the HEO and the MET⁸⁶ are discussing with the Commission the validity of the system of long term PPAs and the possible volume of stranded costs (threshold price-mechanism). The aim is to ensure that the new regulatory framework is compatible with European competition law. Under the New Electricity Model, the government also intends to create the appropriate incentives for MVM and power generators to renegotiate the PPAs.
- (195) It should be noted that the Commission has opened in November 2004 a State Aid investigation on long-term PPA in Hungary⁸⁷. The opening of this procedure is likely to give all interested players an additional interest in a successful renegotiation of the PPAs.
- (196) If the PPAs are substantially modified before entry into force of the New Electricity Model in 2007 and if the process results in the release of important generation capacities and electricity quantities⁸⁸, power generators will be able to supply traders (open segment of the market and USP) and eligible customers either directly through bilateral contracts (OTC market) or indirectly through the newly created organized market (power exchange).

- Supply of electricity to end users

- (197) In terms of access to and supply of electricity to end users in Hungary and depending on the outcome of the long-term PPAs renegotiations, the New Electricity Model may bring the following changes.
- (198) First, approximately one third of the total demand originates from residential customers in Hungary. Although the electricity market will be fully opened in 2007, it is expected that most household customers will continue purchasing from the USPs.
- (199) Secondly, commercial and industrial users, which account for two thirds of total Hungarian demand, will potentially be supplied through four distinct supply channels: (i) OTC market, (ii) Organized market, (iii) Imports and (iv) MVM

⁸⁶ Minutes of call with Mr. Hatvani, Deputy Secretary of State, MET, on 23 August 2005.

⁸⁷ See Commission press release IP/05/1407 of 10 November 2005.

⁸⁸ The renegotiation of the PPA could result in the transformation of the current physical capacity and energy delivery agreements into financial payments obligations, whereby MVM will only act as a clearing house.

auctions. Large electricity end users may be supplied directly through those ways while small and medium electricity end users will be supplied indirectly through traders.

- (200) Large industrial users and traders may purchase through bilateral contracts, on the OTC market, from (i) current large power generators (provided the long term PPAs have been renegotiated or only for the quantities in excess of the long term PPAs), (ii) from smaller power generators (not subject to long term PPAs), (iii) from newly built power plants (not subject to long term PPAs) and (iv) from traders.
- (201) Certain quantities of electricity will be traded through the Organized Market (traders and large industrial customers). Based on the discussions with the HEO, in the long term, this proportion can be roughly estimated to one third of the electricity finally sold to commercial and industrial users.
- (202) Large industrial users and traders will continue importing electricity. Cross-border capacities will remain allocated among bidders through auctions. They will also be able to purchase power capacity through auctions imposed on MVM. The extent of these mandatory auctions is still unclear.
- (203) If the PPAs are not substantially modified before 2007 and the introduction of the new model, power generators will continue reserving the majority of their capacities and delivering the majority of their electricity production to MVM, which will then in turn most likely sell the majority of these quantities to the USP⁸⁹ or through mandatory auctions (monthly and / or yearly). In this case, even under the new electricity model, current power generators will not be able to contract directly with traders or end users and this will impede the emergence of a competitive and efficient OTC market. Large power generators will remain bound to MVM and traders will have to rely on imports or electricity not sold through PPAs, as in the current situation.
- (204) The negative impact of the PPAs on competition could be partially compensated by mandatory capacity auctions imposed on MVM either on the organized market or on the OTC market, which could be part of the additional obligations imposable on SMP traders on the wholesale market.
- (205) In order to base its competitive assessment on the most reasonable assumptions as regards the future electricity markets developments in Hungary, the Commission also consulted the most important market players on their expectations about the evolution of the electricity regulatory framework in July 2007. Although most of those players referred to a certain degree of uncertainty, they generally confirmed that the essential elements of the HEO recommended market model would most likely be adopted.
- (206) The market investigation has also pointed to a degree of uncertainty as regards the renegotiation of the long term PPAs. Although the PPAs are being scrutinised by the Commission under State aid rules to ensure they do not create any distortion of competition in the electricity sector, both MVM and power generators do not have

⁸⁹ In case of insufficient liquidity on the market, the SMP traders may be required by the HEO to supply the USPs so that they are able to perform their functions.

an interest in renegotiating the PPAs. The PPAs grant power generators relatively high electricity purchase prices and stable and reasonable profitability. Their termination would imply more competition between power plants and greater uncertainty with respect to electricity sales prices. It would decrease the size and the role of the public utility segment and would put an end to MVM's strong position as public utility wholesaler.

(207) The Commission notes that the evolution of the electricity regulatory framework and its timing have not been contested by the parties in their Reply to the SO.

(iii) Relevant product markets

(208) In view of the current regulatory framework in market conditions in Hungary, the parties distinguish the following relevant product markets for the supply of electricity to (i) residential or household customers, (ii) small industrial and commercial customers and (iii) medium and large industrial and commercial customers. The parties also identify the generation of electricity as a relevant product market in itself, separate from the market for electricity wholesale. The parties further submit that only the generation of electricity is an affected market for the assessment of the proposed operation⁹⁰.

(209) The Commission has in the past⁹¹ distinguished separate product markets for the generation and wholesale supply of electricity (i.e., production of electricity in power plants and physical import of electricity through inter-connectors and its sale on the wholesale market to traders, distribution companies or large industrial end-users), transmission of electricity (via high-voltage grid); distribution of electricity (via low-voltage grids), retail supply of electricity (to small commercial and industrial users and residential customers) and balancing services.

(210) On the basis of the past practice and the investigation in this case, the Commission considers that the following product markets are relevant for the assessment of the present transaction:

- Electricity infrastructure operations, including the transmission of electricity, the distribution of electricity
- Provision of balancing power;
- Generation and wholesale supply of electricity to traders, to MVM and to the RDCs;
- Retail supply of electricity to medium and large commercial and industrial customers, small and medium commercial and industrial customers and to residential customers.

⁹⁰ Form CO, Page 113.

⁹¹ Case COMP/M. 2947 Verbund/Energie Allianz, COMP/M. 3268 Sydkraft/Gräninge, COMP/M.3440 ENI / EDP / GDP.

- (211) This delineation of the relevant product markets in the electricity sector only differs from the market delineation proposed by the parties as regards the combination of electricity generation and wholesale activities in one single relevant product market. However, this difference (and the precise delineation) has no impact on the outcome of the assessment of this case. It should be noted that the parties did not contest the definition of the relevant product markets in the electricity sector in their Reply to the SO.

a. Infrastructure

Transmission of electricity

- (212) The operation and management of the high voltage grid (“Transmission of electricity”), has been consistently identified by the Commission as a relevant product market and as a natural monopoly.
- (213) In Hungary, the transmission grid is owned and operated by MAVIR, the transmission grid operator, which is a subsidiary of MVM. Access to the transmission grid is granted to third parties at a regulated tariff. Transmission lines may have a 750 kV, 400 kV or 220 kV voltage.
- (214) Although this product market is not an affected product market under the meaning of the Merger Regulation, the analysis of the access to available capacity on this grid and to cross-border inter-connectors is relevant for the assessment of the proposed transaction.

Distribution of electricity

- (215) The operation and management of the lower voltage grid(s) (“Distribution of electricity”) has also been identified by the Commission as a relevant product market and as a natural monopoly.
- (216) In Hungary, the distribution grids are owned and managed by the RDCs, which are the distribution grid operators. Access to the distribution grid is granted to third parties at regulated tariffs. Main distribution lines have a 120 kV voltage and secondary distribution lines have a voltage ranging from 35 kV to 220 V.
- (217) Although there are six regional distribution grids in Hungary, these grids cover different parts of the country and do not overlap. Each of these grids therefore constitutes a separate product market as, for any given customer, distribution through one distribution grid is not substitutable with distribution through another grid.
- (218) Although these product markets are not affected product markets under the meaning of the Merger Regulation, the analysis of the access to available capacity on these grids is relevant for the assessment of the proposed transaction.

b. Balancing power

- (219) In previous decisions, the Commission has distinguished a market for balancing power, in view of the lack of substitutability with other electricity supply at the wholesale level⁹².
- (220) In most electricity markets, the system operator is responsible for maintaining the tension in the grid within a very narrow bandwidth. If there is over-consumption, the tension in the grid would drop and this could cause at some point network stability problems. A problem also arises if there is under-consumption as then the tension in the grid rises above an acceptable tolerance level and the system operator must make sure that either some generation capacity is switched off or that some consumption is added. In Hungary, the system operator (MAVIR) operates the balance energy system and purchases energy in order to supply balance energy for the balance units. The system operator also purchases electricity in order to adjust the losses of the transmission grid as well as to provide network-related services.
- (221) The electricity used for system balancing is only produced by gas power plants as nuclear and lignite power plants do not offer the appropriate technical requirements (load charging, speed) and is purchased by the system operator at the national level. In addition, a large part of the electricity is purchased from MVM due to the existence of long term PPAs.
- (222) The Commission's investigation confirmed that the provision of balancing power constitutes a relevant product market for the purposes of this decision.

c. Generation/Wholesale supply of electricity

- (223) The Commission has in previous decisions considered the generation and wholesale supply of electricity as a separate product market⁹³. This encompasses the production of electricity at power stations as well as electricity physically imported through inter-connectors by traders⁹⁴. The parties distinguish the markets for the generation of electricity and the market for the wholesale of electricity⁹⁵. However, they do not provide any reasons why the two product markets should be separate.
- (224) The Commission's market investigation confirmed that the generation of electricity and wholesale of electricity in Hungary belong to the same relevant product market. The supply side of this product market is constituted by power generators, wholesale traders and electricity imports and the demand side is constituted by the various

⁹² The wholesale services that come closer to balancing power services are so called "intra-day" trading opportunities at which the companies in actual under- or over-supply can trade their surpluses or purchase their extra needs. However, if there is no continuous intra-day trading, with immediate delivery, this trading system is in itself insufficient to match supply and demand at any time.

⁹³ See Case COMP / M.3268-Sykraft/Granninge.

⁹⁴ Electricity may also be imported by large industrial customers directly. The activity of large industrial customers on the Hungarian market is however currently very limited.

⁹⁵ Form CO Page 113 and 114.

categories of electricity resellers, MVM, the RDCs and electricity traders. The market investigation has also indicated that these various categories of customers belong to distinct relevant product market due to the distinct regulatory framework.

- (225) The relevant product markets have to be seen against the background of the evolution of electricity regulatory framework in Hungary. For this purpose, a distinction has to be drawn between the current electricity sector structure and the structure that should soon be in place after the implementation of the New Electricity Model and the amendment of the long-term PPAs.
- (226) In their reply to the SO, the parties did not contest the Commission's conclusion that electricity generation and wholesale belong to the same relevant product markets.

Wholesale supply of electricity to traders

- (227) Under the current regulatory framework, traders that are present on the liberalised segment of the electricity wholesale market are entitled to purchase electricity from the power generators, from other traders, from the public utility wholesaler and from abroad, and they are entitled to sell electricity to the eligible customers, to other traders and to the public utility wholesaler. Electricity traders currently active in Hungary are generally subsidiaries set up by the RDCs to be present on the open segment of the market (referred to as "trading subsidiaries of the RDCs") or subsidiaries of recently established European trading groups⁹⁶. At the moment, the majority of electricity traders only supply electricity to other traders or to large industrial customers.
- (228) In view of the regulatory framework applicable to electricity traders, the wholesale supply of electricity to traders constitutes a relevant product market open to competition.
- (229) Under the new regulatory framework, the scope of the open segment of the electricity wholesale market will expand significantly as RDCs will also act essentially as traders. Depending on the reduction of the scope of the long term PPAs and on mandatory auctions imposed on MVM, additional generation capacity will also be released to be traded on the open segment of the wholesale market.

Wholesale supply of electricity to MVM

- (230) The current regulatory framework is based on a hybrid system (regulated and open segments of the market). On the one hand, a large part of the Hungarian wholesale market is organised according to a "single-buyer" scheme. In this regulated segment of the market, power generators offer the amount of electricity generated which has been contracted for public utility purposes to the public utility wholesaler, MVM. On the other hand, the open segment of the wholesale market is based on a competitive market. The volumes produced by power plants, not covered by a public utility contract, the electricity contracted by MVM for public utility purposes and imports are purchased by traders on the open segment of the wholesale market.

⁹⁶ MVM also owns the MVM Partner electricity trader.

- (231) In view of the existence of a public utility market segment and of the long term PPAs, the wholesale of electricity to MVM by large Hungarian power generators constitute a relevant product market not open to competition.
- (232) Under the new regulatory framework, the public utility wholesale segment will most certainly cease to exist in the regulatory framework. The Commission therefore considers that the wholesale supply of electricity to MVM will therefore progressively become part of the same product market as the wholesale supply of electricity to other traders, depending on the reduction in the scope of the long-term PPAs.

Wholesale supply of electricity to RDCs

- (233) Under the current regulatory framework⁹⁷, the public utility wholesaler has an obligation to supply the RDCs at an official price to the extent of the performance of the public utility contracts concluded between the RDCs and the public utility wholesaler. MVM and the RDCs are under an obligation to conclude an agreement for the allocation and receipt of the electricity required for the supply of public utility customers. These long-term PPAs between MVM and the RDCs provide that no discrimination shall be made by MVM among the RDCs. The RDCs are not allowed to purchase electricity for public utility purposes from other sources.
- (234) In view of this regulatory framework currently applicable to RDCs, the wholesale supply of electricity to RDCs constitutes a relevant product market not open to competition.
- (235) Under the new regulatory framework, the RDCs will not longer act as public utility suppliers but as Universal Service Providers (USP) and will be able to procure electricity from any electricity wholesaler. They will however obtain additional rights (privileged access to electricity sold by MVM) and obligations (public service of household customers). The Commission therefore considers that, after the introduction of the new regulatory framework, the wholesale supply of electricity to RDCs will most likely become part of the same product market as the wholesale supply of electricity to other traders.

d. Retail supply of electricity to end users

- (236) In its past decisions, the Commission defined the relevant product markets for the retail supply of electricity to end users based on categories of customers. The Commission has identified these customers groups on the basis of the relevant regulatory framework applicable to them and their consumption profile.
- (237) The parties submit that, for the purpose of the assessment of the present operation, the retail supply of electricity should be considered as a market distinct from the market for the wholesale supply of electricity. In accordance with the Commission past practice, the parties further distinguish three categories of end users (medium and large industrial and commercial customers (MLCs), small industrial and

⁹⁷ Article 43 of the HEA

commercial customers (SCs) and residential customers). In addition, the parties take the view that all eligible customers - not only those who have actually switched to the open segment of the market - belong to those group of end users.

- (238) Although a number of market respondents to the market investigation stated that end users in the regulated system and the non-regulated system should be distinguished as they have distinct supply conditions, the Commission supports the view of the parties that those end users belong to the same relevant product market. All eligible customers choose freely to be in the regulated or in the open segment of the market according to the price and conditions in each segment. Switching does not entail high costs for the customers. Hence, it has been confirmed that, not only customers switched to the open segment of the market, but also that customers switched back to the regulated segment of the market. Therefore, the Commission takes the view that the distinction between eligible customers that have switched to the open segment of the market and those that have stayed in the regulated segment of the market is not relevant for the purposes of the definition of the relevant product markets.
- (239) The market investigation has confirmed that the three groups of end users identified by the parties are the most relevant for the definition of product markets due to their consumption profile and the applicable regulatory framework. MLCs and SCs have distinct consumption profiles and residential customers constitute a separate relevant product market as they are currently not eligible.

Retail supply of electricity to large commercial and industrial customers and retail supply of electricity to small commercial and industrial customers

- (240) All non-residential customers (commercial and industrial customers) are entitled to switch supplier and purchase their electricity needs either on the regulated segment of the market from their local RDC or from an electricity trader on the open segment of the market. These end users are also entitled to change traders and to switch back to the regulated segment of the market. According to the parties, although the legal status of MLCs and SCs is similar, those two end user categories differ by their consumption profiles and the commercial relationship with their electricity suppliers.
- (241) The parties define MLCs as end users having an average annual electricity consumption of more than 0.5 GWh whereas SCs are defined as non residential customers having an average annual consumption of less than 0.5 GWh. The parties submit that the group of customers described as MLCs includes all customers that receive electricity at high and medium voltage⁹⁸ and chain customers whereas the SCs purchase lesser amounts of electricity and are supplied at low voltage (0.4 kV).
- (242) With respect to consumption profiles, the parties submit that MLCs' consumption profile is in general more stable than SCs consumption profile over the year and over the day. SCs have in general a fluctuating demand within the day, with a lower consumption in the evening and the night.

⁹⁸ 10-120 kV for TITÁSZ customers for instance – Source: Parties replies to the Request for Information dated 18/07/05 (Question 15). The parties underline that large industrial companies are often supplied on middle voltage (10-20-35 kW), such as [...]*

- (243) MLCs and SCs also differ in their approach of electricity procurement. MLCs usually have professional staff and resources available to effectively negotiate and compare the various offers presented by the traders/RDCs. They usually open tenders for electricity procurement and seek offers from various market players. As a consequence, they usually receive individual offers tailored to their needs from their electricity suppliers. They are usually dealt with by so-called key-account managers by their commercial partners. On the contrary, SCs have limited resources to compare terms and conditions and are characterised by a mass marketing approach from electricity suppliers. As a result of these distinct procurement patterns, as of August 2005, more MLCs have switched supplier (on the open segment of the market) than SCs.
- (244) E.ON's internal presentations⁹⁹ [...]*. According to those documents, [...]*.
- (245) Hence, the market investigation has confirmed the market definition proposed by the parties and, under the current regulatory framework, the retail supply of electricity to MLCs and SCs constitute two distinct relevant product markets for the purposes of the present decision. Although these product markets do not constitute an affected product market under the meaning of the Merger Regulation, the analysis of their competitive dynamics and of the evolution of E.ON's market position are relevant for the assessment of the impact of the proposed operation.
- (246) Under the new regulatory framework, the public utility segment is expected to be terminated for MLCs and SCs, which will have an impact on the competitive conditions on the retail supply of electricity to MLCs and SCs. As residential customers will become eligible, they may also become part of the SCs market (see below).

Retail supply of electricity to residential customers

- (247) In the current regulatory framework, residential customers are currently not eligible to switch supplier and purchase their electricity needs from their local RDC in a regulated environment.
- (248) In view of this regulatory framework currently applicable to residential customers, the retail supply of electricity to residential customers constitutes a relevant product market not open to competition.
- (249) As regards the regulatory framework after the market opening, the market investigation has not provided clear-cut indications on whether residential customers and SCs will belong to the same relevant product market.
- (250) However, the question of whether residential customers and SCs will belong to the same relevant product market after the opening of the residential customers market segment can be left open for the purposes of this case as the competitive assessment is the same under each alternative.

⁹⁹ E.ON's reply to the Commission's request for information of July 18, 2005. Binder Supplement I, Reply to Question 122. « E.ON Energie, Capital Market Day », Munich, September 6, 2004.

(iv) *Relevant geographic markets*

- (251) The parties submit that the relevant product markets in the electricity sector are national or sub-national¹⁰⁰ in scope, essentially due to the regulatory framework in Hungary. This approach was confirmed by the market investigation.
- (252) Although some respondents to the market investigation argue that the electricity wholesale market could have a broader geographic dimension, the majority of market players highlighted the specificities of the Hungarian market and supported the views of the parties. In view of those comments and of the significant imports to Hungary, the Commission carefully assessed the relevance of a geographic market wider than Hungary for electricity wholesale but came finally to the conclusion that, under the current regulatory framework, the most appropriate geographic scope of this relevant product market was national.

a. Infrastructure

Transmission of electricity

- (253) The Hungarian electricity transmission grid is owned and operated by MAVIR at the national level. Therefore, the electricity transmission market is national in scope.

Distribution of electricity

- (254) The six Hungarian electricity distribution grids are owned and operated by the six RDCs. Therefore, the electricity distribution market is sub-national in scope and each of the distribution grid regions constitutes a distinct relevant geographic market.

b. Balancing power

- (255) Electricity used for system balancing cannot be imported as it needs to be produced in the country and controlled by the national Hungarian TSO in accordance with the UCTE regulation. In addition, import nominations/schedules are done for the next day and it is not possible to re-nominate them during the day. Therefore, the geographic scope of the market for balancing power is national.

c. Generation / Wholesale supply of electricity

Wholesale supply of electricity to traders

- (256) The parties submit that the relevant product market is national in scope due to the Hungarian regulatory framework. They claim that, according to the relevant provisions of the HEA, in order to obtain a Hungarian license for electricity trading

¹⁰⁰ The Parties take the view that the market for the supply of electricity to residential customers has a sub-national scope; all other markets have a national scope.

it is necessary that a company is established in Hungary. It is therefore not legally possible for an electricity trader based outside of Hungary to sell electricity in Hungary without establishing a subsidiary in Hungary beforehand. The parties also underline that it cannot be excluded that with the ongoing liberalisation electricity wholesale markets will in the future be wider than national markets.

- (257) In the market investigation, a few market respondents claimed that the geographic dimension of electricity wholesale market in the current regulatory framework was broader than national due to the significant role played by imports.
- (258) Due to its central position in Eastern Europe, Hungary is highly interconnected with its neighbouring countries, notably Austria, Slovakia, Ukraine, Romania, Serbia and Croatia. In 2003, Hungary imported 11.4 TWh and exported 4.5 TWh, resulting in 6.9 TWh of net imports. According to MVM, the potential technical import capacity is even larger as connectors with Southern countries are not used for imports (Serbia, Romania). As a result, 18.1%¹⁰¹ of the electricity used in Hungary in 2003 was imported. This share of import is relatively high in comparison to other European countries: Italy (15.9%), Austria (11%), Belgium (7.3%) and Portugal (6.5%). In 2005, the net import balance is expected to reach 8 TWh based on MAVIR estimates¹⁰².
- (259) Although electricity imports appear to represent a significant share of the national consumption (and have a predominant role in the open segment of the market), the competitive conditions for the wholesale supply of electricity differ significantly in Hungary and its neighbouring countries.
- (260) First, Hungary has a significant role as a transit country and exported quantities amounted to around 40% of imported quantities in 2003. Electricity is essentially imported from the North (Slovakia and Ukraine) and exported to the South (Croatia and Serbia). The only country with which electricity flows take place in both directions is Austria. The real size of electricity transit through Hungary is difficult to estimate since there is no differentiation between export and import and transit under the CBT regime and cross-border capacities are attributed irrespectively of the ultimate use.
- (261) This means that gross import figures and the interconnection capacities are not entirely relevant for the assessment of the geographic scope of the market. Net Import figures reflect more the competitive constraints exerted by imports and imports capacity with Southern countries should not be taken into account. Similarly, the fact that the vast majority of electricity sold on the Hungarian open segment of the wholesale market comes from import is essentially related to the very low domestic production capacity available on the open segment of the market due to the existence of the long-term PPAs.
- (262) Secondly, the electricity interconnectors with Austria and Slovakia are almost all the time congested according to the HEO, so that no additional imports are currently

¹⁰¹ UCTE Statistical Yearbook, 2003.

¹⁰² MAVIR's presentation: « Information on the Hungarian Power System and on the Hungarian Power System Operator Company », May 2005.

possible without any additional interconnection capacity. The HEO further underlines that domestic congestion and the cross-border allocation methodology limit the import capacities.

- (263) As a result, the influence of imports on the electricity wholesale prices in Hungary is limited, as reflected in the differing price levels between Hungary and its neighbouring countries. Although electricity wholesale prices levels are difficult to estimate as most electricity wholesale markets in Hungary's neighbouring countries (except Austria) are not yet liquid and transparent, the market investigation showed that Hungarian electricity wholesale prices are lower than prices in Austria, Germany and Croatia but higher than in Slovakia, Romanian, Ukraine and Serbia. As an example, according to the parties¹⁰³, electricity wholesale prices in Romania, Slovakia and Serbia are currently respectively [0-5]* EUR/ MWh, [0-5]* EUR/MWh and [0-5]* EUR/MWh lower than in Hungary.
- (264) The market investigation has also indicated¹⁰⁴ that limited interconnection capacity with countries in the North of Hungary – where electricity production costs are lower – entails that interconnection capacity allocated through auctions is expensive. As a result, electricity prices between Hungary and its Northern neighbouring countries do not converge as auction prices offset the electricity prices differences.
- (265) Thirdly, as presented by the parties, the Hungarian regulatory framework explicitly specify that electricity traders should set up a Hungarian trading company and obtain a Hungarian trading license to be active on the Hungarian market¹⁰⁵. A cross-border trading license is required to import electricity. These requirements clearly restrict the possibilities for any foreign company to pursue electricity trading and wholesale activities on the Hungarian market.
- (266) Fourthly, the Hungarian regulatory framework and market opening rules still remain substantially different from those of neighbouring countries. A market operator has underlined that the legal framework concerning power plants primary fuel (state aid for local coal and nuclear) differ between countries as well as environmental and other regulations affecting power generation. As a result the power generation mix of Hungary and its neighbouring country differ much, which has an impact on the electricity wholesale market homogeneity.
- (267) It cannot be excluded that, in the future, depending on future developments such as changes in the regulatory framework, additional interconnection capacity and potential price convergence, the market for the wholesale supply of electricity to traders in Hungary will acquire a broader geographic dimension.

¹⁰³ E.ON's submission dated 2 September 2005.

¹⁰⁴ *"The congestion is due to the higher demand than supply. The TSOs are holding auctions for the cross-border transit capacity on each congested border connection. The result of these auctions is to be paid to the TSOs and practically the TSOs are gaining the price differences between the markets."*

¹⁰⁵ Article 34 of the Executive Decree to the HEA.

Wholesale supply of electricity to MVM

- (268) Under the current Hungarian law, MVM has to procure electricity for public utility purposes in the framework of long term PPAs with the largest Hungarian power plants. The geographic scope of the market for wholesale supply of electricity to MVM for public utility purposes is therefore national in scope.
- (269) Under the new regulatory framework, MVM will have the ability to source electricity on the open segment of the market for the wholesale market depending on the reduction in the scope of the long-term PPAs. The market for wholesale supply of electricity to MVM will therefore remain national for the same reasons as the market for wholesale supply of electricity to traders.

Wholesale supply of electricity to RDCs

- (270) Under the current Hungarian law, the RDCs have to procure electricity for public utility purposes in the framework of supply agreements with MVM. The geographic scope of the market for wholesale supply of electricity to the RDCs for public utility purposes is therefore national in scope.
- (271) Under the new regulatory framework, the USPs will have the ability to source electricity on the open segment of the wholesale market. The market for wholesale supply of electricity to RDCs will therefore become part of the market for the wholesale supply of electricity to traders.

d. Retail supply of electricity to end users

Retail supply of electricity to MLCs and SCs

- (272) In previous decisions¹⁰⁶, the Commission highlighted that a local presence is required for all electricity retail activities, whether to small or large customers, as brand recognition, marketing, customer service, metering and billing were essential.
- (273) In their submission, the parties consider the supply of electricity to all eligible Hungarian customers as national in scope due to the homogeneous competitive conditions throughout the country. Eligible customers may procure electricity from their RDCs, active at a sub-national level, or from electricity traders which are active nationwide.
- (274) The market investigation has confirmed that under the current regulatory framework competition takes place at a national level for eligible customers. First, electricity traders may target specific customers (essentially large industrial users or other traders) but do not privilege any specific geographic area within Hungary. Secondly, electricity import and export figures clearly indicate that very few eligible customers import electricity directly, although they are entitled to do so. According to the

¹⁰⁶ Case COMP/M.3440 ENI / EDP / GDP.

HEO¹⁰⁷, Hungarian eligible customers imported [500-1,000] GWh of electricity in 2003 and [0-500] GWh in 2004, which account respectively for [0-5%] and [0-5%] of the net Hungarian imports in those years.

- (275) The geographic scope of the market for retail supply of electricity to MLCs and SCs is therefore national in scope.
- (276) As regards the new regulatory framework, neither the parties nor the market investigation did provide any indication that this geographic dimension of retail supply of electricity would become broader.

Retail supply of electricity to residential customers

- (277) Under Hungarian law, residential customers are obliged to procure electricity from their local RDCs and are not entitled to switch traders on the open segment of the market. Therefore, the geographic scope of the market for retail supply of electricity to residential customers is sub-national in scope and each of the distribution grid regions constitutes a distinct relevant geographic market.
- (278) Under the new regulatory framework, residential customers will be able to switch suppliers. The market for retail supply of electricity to residential customers will therefore acquire a national dimension for the same reasons as the other electricity retail markets.
- (279) To conclude, the Commission has assessed the impact of proposed transaction in the electricity sector based on the following market definitions:
- Electricity infrastructure operations:
 - (i) Transmission of electricity in Hungary,
 - (ii) Distribution of electricity in the Hungarian RDCs' areas,
 - (iii) Provision of balancing power in Hungary,
 - Generation/Wholesale supply of electricity:
 - (i) Wholesale supply of electricity to traders in Hungary,
 - (ii) Wholesale supply of electricity to MVM in Hungary,
 - (iii) Wholesale supply of electricity to RDCs in Hungary,
 - Retail supply of electricity to end users:
 - (i) Retail supply of electricity to medium and large commercial and industrial customers in Hungary,

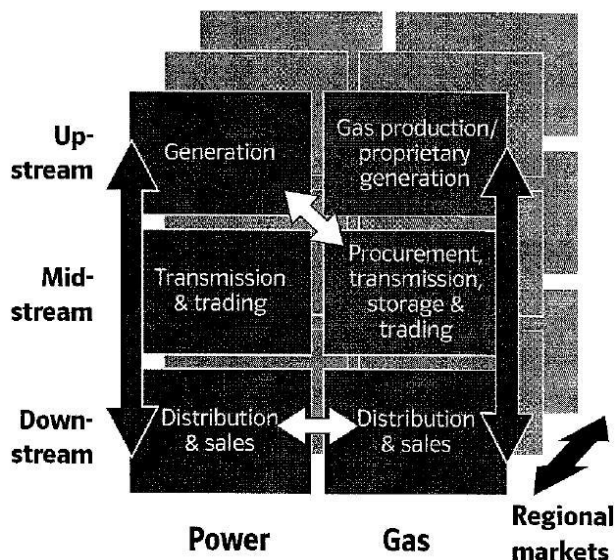

¹⁰⁷ HEO's presentation: "Hungarian Electricity Market", 26 July 2005.

- (ii) Retail supply of electricity to small commercial and industrial customers in Hungary,
- (iii) Retail supply of electricity to residential customers in the Hungarian RDCs' areas.

VI. COMPETITIVE ASSESSMENT

(280) Respondents to the Commission's market investigation have expressed concerns at all levels of the gas and electricity supply chains, from the upstream level of gas procurement to the downstream level of electricity production and supply. They underline that direct access to gas is essential for gas and electricity retail activities as well as for the production of electricity in Hungary. In view of these concerns, the Commission has carried out a detailed assessment of the impact of the proposed transaction on the gas and electricity markets defined in recitals 141 and 279, with the exception of five markets which are not affected by this transaction (the market for the distribution of gas in the Hungarian RDCs' areas, the market for the transmission of electricity in Hungary, the market for the distribution of electricity in the Hungarian RDCs' areas, the market for the provision of balancing power in Hungary, and the market for the wholesale supply of electricity to MVM in Hungary).

Gas and electricity supply chain (simplified flow chart):

Source: E.ON's reply to the Commission request for information dated 18 July 2005 – Binder Supplement I

(281) Prior to the transaction, MOL already has an almost exclusive control over the Hungarian gas infrastructures and supply contracts. The group also owns all the Hungarian gas storage facilities and has a quasi-monopoly on the gas wholesale markets. The essential change brought by the proposed transaction is that E.ON, unlike MOL, has strong market positions in the retail supply of gas through its majority and minority ownership in three gas RDCs, in the generation of electricity, and in the retail supply of electricity through its majority ownership in three electricity RDCs and its trading subsidiary E.ON EK.

(282) Therefore, the proposed merger will create a fully vertically integrated entity along the gas and electricity supply chains. The Commission has established on the basis

of its investigation and its economic assessment that such integration will directly result in the new entity having the ability and the incentive to significantly impede competition on the downstream gas and electricity markets by raising rivals' costs or by foreclosing their access to gas resources.

- (283) The Commission's competitive assessment of the transaction has been achieved both under the current regulatory framework and under the future regulatory framework. For the reasons developed below, competition concerns will arise in the gas and electricity sectors immediately after the transaction, already under the current regulatory framework. The concerns will be even greater when the regulatory framework will be modified, as expected by all market operators, in order to complete the liberalisation of the Hungarian gas and electricity sectors.

A. MOL WMT holds a dominant position in the wholesale supply of gas in Hungary

- (284) Prior to the liberalization of the Hungarian gas sector, MOL was the legal monopolist for the wholesale supply of gas in Hungary. On the regulated segment of the market which still coexists with the liberalized market in the Hungarian hybrid model, MOL WMT retains its former monopoly rights. On the open segment of the gas markets, MOL WMT is currently dominant on all the markets for the wholesale supply of gas in Hungary (gas traders and large power plants) and its dominant position is not likely to be threatened in the short to medium term by new entry for the following reasons.
- (285) In order to compete on the gas wholesale markets in Hungary, it is necessary to have: (i) access to a competitive source of gas in sufficient quantities¹⁰⁸; (ii) non-discriminatory access to the transmission network, in particular cross-border entry points (and to the distribution network, for customers connected to a distribution network); and (iii) access to storage (to respond mainly to seasonal variations in the gas consumption of customers). It is also necessary to obtain the relevant licenses from the HEO, although the investigation has not revealed any particular difficulties in this respect.
- (286) The market investigation has revealed the existence of significant barriers to entry on the Hungarian gas market. The main problem faced by new entrants in Hungary, including international energy operators, is the difficulty to access to competitive sources of gas, and the lack of liquidity¹⁰⁹ on the Hungarian gas wholesale markets. In addition, MOL WMT derives significant advantages from its incumbency position, notably in terms of balancing on the transmission network and storage costs (synchronicity).
- (287) There are basically two main possibilities to obtain natural gas for Hungary: domestic production and imports of gas. In 2004, gas imports accounted for around 80% of Hungary's total gas consumption and this share is expected to increase as

¹⁰⁸ See notably the response of EMFESZ to Questions to Question 23 d) and 25 d) of the request for information of 19 July 2005.

¹⁰⁹ Lack of market players and offers on the gas "secondary market" (sale of gas between gas traders).

domestic gas production gradually declines and gas consumption increases. Prior to the transaction, MOL WMT already controls almost all gas sources available for Hungary. Following the transaction, the new entity will continue to have an almost exclusive control over all competitive gas sources for the Hungarian gas market.

(i) *MOL WMT controls domestic gas resources*

(288) Access to Hungarian domestic gas production is relevant for the assessment of the transaction as it constitutes one of the potential gas sources for new entrants and as it is currently a competitive gas source. The following section will demonstrate that the new entity will have control over these gas resources for at least three years and that the quantities of gas available for third parties in the subsequent years will in all cases be limited.

(289) Hungarian gas is competitive compared to imported gas¹¹⁰:

	2004	
MOL	Gas total production cost	[25-35]* HUF/m ³ ¹¹¹
E&P	MOL WMT average purchase price	[25-35]* HUF/m ³ ¹¹²
Imports	MOL WMT average purchase price through the Beregovo pipeline	[25-35]* HUF/m ³
	MOL WMT average purchase price through the Baumgarten pipeline	[25-35]* HUF/m ³
	MOL WMT average purchase price	[25-35]* HUF/m ³

Hungarian domestic gas production

(290) The Hungarian domestic gas production is not negligible and amounted to approximately 3 bcm in 2004, accounting for about 20% of the total national gas consumption. This domestic production is however declining and is expected to decrease from around [1-4]* bcm in 2005 to [1-4]* in 2015. MOL E&P accounts for the vast majority of the Hungarian domestic production. Two US companies, El Paso and POGO (now Toreador), have acquired exploration blocks to carry out gas exploration activities. At the moment, however, only El Paso produces marginal quantities of gas (35 million m³ in 2004) sold to MOL.

The Supply Agreement

(291) As already indicated, MOL E&P is not being acquired by E.ON under the proposed transaction. Therefore the domestic gas resources belonging to MOL E&P will not be controlled by E.ON. However, MOL WMT and MOL E&P have signed, as part of the transaction, a long term supply agreement ([...]*) that entered into force on 1

¹¹⁰ See the Parties' submission dated 5 July 2005.

¹¹¹ MOL submission dated 8 September.

¹¹² In their reply to the SO, the parties claim that the lower average price of domestic gas is due to its lower calorific value. According to the parties, domestic gas and imported gas have the same price if calorific values are taken into account.

July 2005 (the “Supply Agreement”). The subject matter of the Supply Agreement is the delivery of domestic natural gas volumes produced by MOL E&P to MOL WMT.

- (292) The volumes of gas to be delivered by MOL E&P to MOL WMT under the Supply Agreement (Contracted Volumes) are set by reference to MOL E&P’s gas production forecasts. MOL’s current gas production forecasts are set out in Annex 7 of the Supply Agreement. MOL E&P has the obligation before 10 March every year to update its production forecasts for the remaining duration of the Supply Agreement.
- (293) The Supply Agreement foresees [...] to be contractually delivered for the [...] which correspond to MOL E&P gas production forecasts and are binding for those three years.
- (294) For the subsequent gas years, the Supply Agreement requires MOL E&P to provide by the 31st March preceding (e.g., by 31 March [...]) the contracted volumes which MOL E&P has the obligation to supply and MOL WMT the obligation to purchase. The Supply Agreement contains minimum delivery quantities of [0.5-2] bcm for the gas year [...] and [0.5-2] bcm for the gas year [...] and maximum quantities of [1-3] bcm from the gas year [...] to [...]. The Supply Agreement foresees a flexible system on the basis of which the actual yearly contracted volumes to be set by MOL E&P may deviate from its revised gas production forecasts, but by no more than 30%. In addition, the Supply Agreement states that MOL E&P has the obligation to make “reasonable efforts” in order to be able to set the gas production forecasts and the gas contracted quantities “as close to each other as possible”.
- (295) The Supply Agreement provides for a price formula, which takes into account a number of factors and is essentially linked to the [...] of natural gas in Hungary.

Availability of domestic gas for third parties

- (296) On the basis of the terms and conditions set by the Supply Agreement and of the Commission’s interpretation of the provisions relating to “Contracted Volume” in the Supply Agreement (including the [...] envisaged therein)¹¹³, the Commission has calculated the amounts that are likely to be delivered to MOL WMT in the gas years covered by the Supply Agreement. The results of these calculations are illustrated in the table below:

¹¹³ Response of E.ON of 6 July 2005 to Questions 5 and 6 of the Commission’s request for information of 29 June 2005.

Quantities in million m ³	MOL E&P Production Forecast		MOL WMT Contracted quantities	
	Total (1)	From existing fields (2)	Normal (3)	Min (4)
2005/2006	[1500-3000]*	[1000-2500]*	[1500-3000]*	[1000-2500]*
2006/2007	[1500-3000]*	[1000-2500]*	[1500-3000]*	[1000-2500]*
2007/2008	[1500-3000]*	[1000-2500]*	[1500-3000]*	[1000-2500]*
2008/2009	[1500-3000]*	[1000-2500]*		[1000-2500]*
2009/2010	[1500-3000]*	[1000-2500]*		[1000-2500]*
2010/2011	[1500-3000]*			[1000-2500]*
2011/2012	[1500-3000]*			[1000-2500]*
2012/2013	[1500-3000]*			[500-1500]*
2013/2014	[500-1000]*			[500-1500]*
2014/2015	[500-1000]*			[500-1500]*

- (297) Figures in column 1 reflect MOL E&P total production forecasts as indicated in Annex 7 of the Supply Agreement, including both expected production from existing fields and expected production from new fields, not yet exploited by MOL E&P.
- (298) Figures in column 2 reflect MOL E&P expected production of existing fields, already currently exploited. The Commission considers that these figures could represent a worst case scenario in case of difficult or unsuccessful exploitation of MOL E&P new gas fields.
- (299) Figures in columns 3 and 4 indicate the volumes of gas to be delivered by MOL E&P to MOL WMT under the Supply Agreement and on the basis of three scenarios (Normal and Min) taking into account the [...] foreseen by the Supply Agreement¹¹⁴.
- (300) Based on MOL's current production forecasts, the Commission has estimated the resulting gas volumes which may be available on the market for third parties in the three different scenarios:

¹¹⁴ The Agreement contains [...] for duration of the contract. Delivered quantities should also remain in a range of [...] around MOL E&P production forecast after the gas year [...].

Gas year	Quantities of MOL E&P production available for third parties (in million m ³)		
	Normal (1)-(3)	Worst case	Best case (1)-(4)
2005/2006	[0-500]*	[0-500]*	[0-500]*
2006/2007	[0-500]*	[0-500]*	[0-500]*
2007/2008	[0-500]*	[0-500]*	[0-500]*
2008/2009		[0-500]*	[500-1000]*
2009/2010		[0-500]*	[500-1000]*
2010/2011		[0-500]*	[500-1000]*
2011/2012		[0-500]*	[500-1000]*
2012/2013		[0-500]*	[500-1000]*
2013/2014		[0-500]*	[500-1000]*
2014/2015		[0-500]*	[0-500]*

- (301) The chart below (established by the Commission on the basis the Supply Agreement) gives a visual illustration of the very limited availability (if any) of domestic gas to third parties, even in the best case scenario:

Mol E&P's production available to third parties
(in million m³)

[...]*

Source: E.ON's reply to the Commission's request for information of 18 July 2005, Annex 21

Gas years [...]* to [...]*

- (302) The Commission has focused its assessment on the impact of the Supply Agreement on the [...]*, with the goal of assessing whether domestic gas produced by MOL E&P will be available on the market for third parties or not. As regards the subsequent years, the parties themselves acknowledge that [...]* it is difficult to predict which quantities of gas will actually be produced by MOL E&P, as it depends on its exploration activities, and which quantities will actually be delivered to MOL WMT on the basis of the Supply Agreement.
- (303) As shown clearly by the figures and the chart above, only marginal volumes of gas will be available on the market for [...]* and only in the best case scenario. These gas quantities, ranging between [200-600]* million m³, only represent [0-5%]* of the total expected Hungarian consumption needs.
- (304) The parties claim (also in their reply to the SO) that MOL WMT has no “*exclusivity rights*” over MOL E&P gas production, as no outright exclusivity clause is foreseen in the Supply Agreement. MOL E&P could theoretically sell gas produced from new fields and in excess of its production forecasts to third parties.

- (305) The Commission acknowledges that the Supply Agreement does not expressly provide MOL WMT with exclusivity purchasing rights over all of MOL E&P's domestic gas production. The Commission however considers that the most relevant figures to assess MOL E&P gas production quantities are MOL E&P's own current production forecasts. It should be pointed out that these figures already include expected production from new gas fields.
- (306) As the Supply Agreement explicitly indicates that the contracted gas quantities are MOL E&P's production forecasts [...]*, the Commission concludes that no domestic gas (at most minimal quantities due to [...]*) will be available for third parties during this period.
- (307) At any rate, most crucially, in their reply to the SO, the parties do not contest the Commission's finding that as a result of the Supply Agreement practically no quantities of domestic gas would be available for third parties on the market during the first three years. The parties state that "*already [...]* the agreement in fact allows MOL E&P significant discretion in deciding the amount of gas to be supplied to ERI/WMT*" while acknowledging that "*the forecast for [...]*) is binding*". Implicitly, they do not contest the Commission's finding that, as a result of the Supply Agreement, access to domestic gas will in practice be foreclosed to the new entity's gas and electricity competitors for at least [...]*.

Gas years [...] to [...]**

- (308) As regards the subsequent gas years, gas quantities potentially available to third parties increase to a maximum of [500-1300]* million m³ in [...]* in the best case, due to more flexible contracted volumes in the Supply Agreement. Although the Commission agrees with the parties that the quantities of domestic gas available to third parties after the [...]* period cannot be precisely evaluated, it should be noted that the Supply Agreement will in any case not allow third parties to have access to more than [25-35%]* of MOL E&P's gas production until 2014/2015 (slightly higher share taking into account the [...]*)).
- (309) The parties state, in their reply to the SO, that the figures elaborated by the Commission constitute a "*misrepresentation of the underlying agreement*" and that the Commission has made a "*significant factual error of assessment in its reading of the long-term supply agreement between MOL E&P and MOL MWT*"¹¹⁵. The parties however do not contest explicitly any of the figures presented in the tables in recitals 296 and 300. The Commission also underlines that this presentation is not only not misleading but even favourable to the parties as it only shows the figures for the "best case" scenario.
- (310) In their reply to the SO, the parties state that "*after the gas years [...]* and certainly after [...]*, a very significant if not all of the domestic production of MOL E&P will be available to be sold to third parties*" and that these quantities "*will continue to represent almost [15-25%]* of Hungarian gas consumption from 2008 to 2010*"¹¹⁶.

¹¹⁵ Parties' reply to the SO, II.4, page 17.

¹¹⁶ Parties' reply to the SO, II.4, page 17.

- (311) The Commission underlines that the [15-25%]* figure mentioned by the parties assumes that the entire domestic production would be available to be sold to third parties after the first three years of the contract, which seems at odds with the conclusion of a ten-year supply agreement between MOL E&P and MOL WMT. The Commission recognizes that MOL E&P's production forecasts beyond the gas years [...] is not binding. This gives MOL E&P some flexibility in its gas production activities, but not as regards the quantities that it is obliged to supply MOL WMT under the Supply Agreement which are based on MOL's production forecasts. The Commission notes that MOL E&P may not deviate by more than [...] from the production forecasts in setting the contracted quantities, and even has an obligation to make *reasonable efforts* to set the contracted quantities as close as possible to the gas production forecasts. In view of the figures presented above in recitals 296 and 300 (based on MOL E&P's current production forecasts and not contested by the parties), the Commission therefore estimates that the quantities will represent at most [5-15%]* of total expected Hungarian consumption needs. The quantities are in any case largely hypothetical and decline with the national gas production.
- (312) The parties also argue that "*the proposed transaction can only improve the potential for access to domestic gas production... [as it] creates the possibility of access by others, since the contracts with MOL exploration and production business falls short of either full ownership or exclusivity*"¹¹⁷.
- (313) The Commission acknowledges that the transaction, by which E.ON acquires MOL's gas wholesaling, marketing and trading business (MOL WMT) while MOL retains its gas production business (MOL E&P division), leads to an "ownership unbundling" of domestic gas resources by separating the supply and production activities of MOL. While prior to the transaction, MOL had no incentive to sell gas to any other third party that would have competed with its affiliate MOL WMT, MOL may as a result of the transaction have an incentive to also sell gas to unaffiliated parties.
- (314) However, in the Commission's view, this positive unbundling is strongly mitigated and offset by the ten-year supply agreement for domestic gas concluded, as part of the transaction, between MOL E&P and MOL WMT. To the extent of the volumes and duration of the Supply Agreement, MOL has already tied its "new freedom" to sell its domestic gas to whomever it pleases after the transaction. As demonstrated above, this agreement reserves most of MOL's future gas production for MOL WMT.
- (315) In addition, as MOL retains a 25%+1 shareholding in MOL WMT, the transaction does not remove all structural links between MOL E&P's domestic gas production and MOL WMT, contrary to what the parties claim. As a result of this structural link, MOL would still have the incentive to favour MOL WMT over third party traders in the sale of its domestic gas production¹¹⁸. MOL would naturally favour a

¹¹⁷ Parties' reply to the SO, Annex I, p. 11.

¹¹⁸ To avoid any potential confusion, the Commission does not state that MOL E&P's incentive to favour MOL WMT results from the proposed transaction. The Commission simply takes the view that the 25% minority shareholding that MOL will retain in MOL WMT will maintain MOL E&P's incentive to favour MOL WMT post transaction.

company in which it holds shares over any other company in view of its financial interest arising from the possibility to receive dividends and to obtain capital gains on the increase in value of its shareholding resulting from MOL WMT's greater profitability (even if no dividends were distributed). The [...] foreseen in the Supply Agreement may therefore lend themselves to being interpreted and resorted to so as to reduce the availability of gas to third parties.

- (316) The parties' argument that the Supply Agreement is necessary for MOL WMT to achieve [...], notably for its [...], does not appear convincing.
- (317) As a matter of fact, if gas suppliers other than MOL WMT were ever to purchase gas from MOL E&P, it would be by definition to serve customers in the liberalised sector. In view of the current "infancy" state of the liberalised sector in Hungary, these customers will have, in all likelihood, just exited the regulated segment of the market and signed a supply agreement with a gas trader. The amounts of gas previously needed by MOL WMT (or by any of the RDCs, which are, for the regulated segment of the market, exclusively supplied by WMT) to supply these customers will no longer be needed. Hence, MOL WMT will not need to retain gas resources to serve customers which are no longer in its portfolio.

Conclusion on access to domestic gas resources

- (318) The Commission believes that, even in the absence of a formal contractual exclusivity clause in the Supply Agreement (agreement between MOL and MOL WMT regarding MOL E&P domestic production), most (if not all) gas produced in Hungary by MOL E&P will be "captive" of MOL WMT, at the very least for the [...] of validity of the Supply Agreement and most likely also for the remainder of the contract¹¹⁹.
- (319) The Commission's market investigation has confirmed that the Supply Agreement will de facto provide the new entity with an exclusive control over the access to Hungarian domestic gas production and will prevent access to this resource by third parties during at least three years.
- (ii) *MOL WMT controls competitive import sources*
- (320) As indicated, there are only two entry points through which gas is imported into Hungary: Beregovo at the Ukrainian border and the HAG at the Austrian border.

¹¹⁹ To avoid any potential confusion, the Commission does not state that third parties' access to domestic production will be reduced as a result of the proposed transaction. The Commission however concludes from the new Supply Agreement concluded between MOL E&P and MOL WMT (as part of the transaction) that the new entity will have an almost exclusive access to domestic gas production during [...] (as MOL WMT before the transaction). This strongly offsets any pro-competitive effect that the (partial) unbundling realised by the proposed transaction between MOL E&P and MOL WMT may have had.

a. Competitive gas import sources in Hungary

- (321) With the exception of marginal quantities of Turkmen gas, all gas imported into Hungary is of Russian origin (i.e. Gazprom)¹²⁰. The market investigation has established that the only competitive source of gas in Hungary is coming from Russia, either Russian gas sourced from Gazprom or gas sourced from another country in the Commonwealth of Independent States (“CIS”)¹²¹, but which needs to be transported through Russia and Ukraine (via transit pipelines under the control of Gazprom).
- (322) Hungary is not geographically close to and/or connected through existing pipelines to other sources of gas in Europe, such as Norwegian gas, Dutch gas, Algerian gas or Middle East and Caspian gas. There is also no LNG (Liquefied Natural Gas) terminal close to Hungary. The HEO estimates that, due to the distance between Hungary and the gas sources and based on the current conditions of supply, the access to competitive alternative sources of gas is limited for Hungary. Due to the direction of gas flows and transportation costs, North African gas by pipeline or delivered as LNG to a North Adriatic port (e.g. Omisalj) is in any case more expensive than Russian gas. Due to North Sea gas flows directions, the only possible solution to source gas from this region is swapping, but the resulting gas price only matches the Russian import price in the best case scenario.
- (323) Alternative gas sources are not expected to be available in Hungary before 2011 with the completion of the Nabucco pipeline, through which gas from the Middle East (Egypt, Iraq, Iran) and the Caspian area could be imported. The other envisaged pipeline projects between Hungary and Slovakia and between Hungary and Romania, if ever constructed, would not bring additional sources of gas into Hungary as Slovakia is also supplied by Russian gas and as Romania initially only intends to import gas from Hungary due the decrease in its national production.
- (324) In their reply to the SO, the parties do not dispute that the only competitive sources of gas in Hungary are currently Russian and/or CIS gas.

b. MOL WMT’s gas sourcing portfolio

- (325) As indicated, prior to the market opening, MOL had a monopsonistic position on all gas procurement activities, with exclusive rights to purchase Hungarian gas and to import gas into Hungary. In order to secure its gas supply, MOL WMT has entered into long-term supply agreements with [...] to import gas through the Hungarian Western and Eastern entry points.

Overview of MOL WMT’s existing long-term gas import contracts

¹²⁰ Gazprom ultimately controls, directly or indirectly, also the access to Turkmen gas, as indicated by both EMFESZ and Centrex, the two trading companies importing (or planning to import) Turkmen gas into Hungary.

¹²¹ In particular gas from Turkmenistan.

- (326) As can be seen from the above table, MOL WMT has [...]* import contracts with [...]*, which account for the vast majority of its gas imports. MOL WMT purchases approximately [5-20]* bcm from Gazprom/Gazexport through Panrusgáz, its joint venture with Gazprom/Gazexport, which is delivered at the Beregovo (81.4%) and HAG (18.6%) entry points.
- (327) MOL WMT also purchase [0-2]* bcm of gas annually from EMFESZ, a Hungarian company affiliated with Eural Trans Gas. MOL initially concluded the contract with Bohlti Trade, a Swiss Company also affiliated to Eural Trans Gas to ensure Hungary's winter gas supply, at a price that is “*lower than the main market (dominant) PRG [Panrusgáz] price*”¹²³. Eural Trans Gas is a Hungarian-registered company which is the sole distributor of Turkmen gas “*with Gazprom and NAK Ukraine support*”¹²⁴. Bothli-Trade subsequently assigned its two gas supply contracts with MOL WMT to EMFESZ Kft.¹²⁵.
- (328) Finally, MOL WMT purchases [0-2]* bcm/year from E.ON and [0-2]* bcm/year from [...]* at the HAG entry point. This gas is approximately [...]* more expensive than the gas purchased from Gazprom/Gazexport via Panrusgáz or from EMFESZ. It is supplied from [...]* on the basis of their overall gas purchase portfolio, although physically it is Russian gas. This gas is clearly not competitive with the direct Russian gas supply from Gazprom/Gazexport.
- (329) In particular, gas imported through the Western entry point is less competitive due to the cost of transit through Slovakia and Austria, which is estimated at 4.0 HUF/m³ (or approximately [10-20%]* of MOL WMT's average gas purchasing price¹²⁶). A third party active in gas has stated that “*In theory, the minimum price difference for gas between Beregovo and Mosonmagyaróvár corresponds to the transport costs through Slovakia to Baumgarten, plus the transport costs through the HAG system, it can be estimated at around 1,3 - 1,6 €/MWh according to the conditions of delivery. In reality, this difference can be much higher as the prices at Baumgarten and at Beregovo are not linked. Indeed, the specialized press mentioned prices above 21 €/MWh at Baumgarten during the last Econgass' auctions, and prices below 15 €/MWh at the Ukrainian border.*”

¹²² The contract started [...]*; the normal annual quantity is [0-3]** bcm.

¹²³ [...]* ; and minutes of the meeting with EMFESZ on 28 July 2005, p. 2: “*Since 1 January 2005, EMFESZ is selling 1.2 bcm to MOL WMT. EMFESZ believes that it is selling to MOL WMT for its gas needs as a trader licensee (and not as a public utility wholesaler licensee). MOL WMT buys from EMFESZ the additional quantities it needs in winter, and buys a stable quantity throughout the year under its contract with Gazprom.*”

¹²⁴ [...]*.

¹²⁵ [...]*.

¹²⁶ Assuming a wholesale gas price of [25-35]* HUF / m³.

- (330) The parties indicated that the cost of transit of gas through the SPP network in Slovakia amounted to [0-2]* EUR/MWh under the presumption of 10 million m³/day, in addition to which customers have to contribute fuel gas in kind amounting to [0-5%]* of transported volumes¹²⁷. Assuming a cost of gas of approximately [28-32]* HUF/m³, the total cost of transportation through the SPP network is [2-4]* HUF/m³. Tariffs on the HAG pipeline were provided by OMV, owner of the pipeline, and amount to approximately [0-1]* HUF/m³ under the assumption of a 3 year capacity booking for 1 bcm/year.
- (331) As mentioned above in recital 40, the gas supply contracts with E.ON and GDF were entered into by MOL in order to diversify its gas sourcing portfolio, thereby increasing the country's security of supply, under the pressure of the Hungarian government.
- (332) It follows that anyone wishing to compete with MOL WMT on the market for the wholesale supply of gas in Hungary must have access to Russian gas (or gas from CIS countries transiting through Russia); and must preferably source a significant part of its gas portfolio through the Eastern entry point (the more competitive entry point)¹²⁸. The market investigation has clearly indicated that, until there are no alternative independent sources of gas (such as the Nabucco pipeline in 2011-2012¹²⁹), all gas sources will be controlled by Gazprom and no competition will be able to develop on the Hungarian wholesale gas markets.

c. Difficult access to Russian gas

- (333) The market investigation has shown that it is currently difficult for new entrants to get access to Russian gas in parallel to MOL WMT's existing contracts. It appears that there would be no incentive on the part of Gazprom to sell "more" gas for exports to Hungary, other than the gas necessary to meet the 2% yearly demand increase, to cover the "supply gap" between the future increase in the Hungarian demand and the demand already covered by the existing long-term import contracts of MOL WMT.

¹²⁷ Submission of the parties dated 14 October 2005.

¹²⁸ Response of Euro-Bridge to the request for information of 3 June 2005 (*"According to our experience, seeing the situation in the Hungarian gas industry and in particular with regard to E.ON's planned steps, we have doubts if there will ever be a real competitive market and competitive conditions in Hungary, as:*

- *The gas supply is practically dependent upon one gas source (the Russian Gazprom) coming through the Eastern cross-border pipelines. The Western pipeline has small capacity and only has a strategic role in case there is turmoil in the Eastern side. The gas coming from West (Russian as well) has a significantly higher price level, the Hungarian consumers could not afford purchasing exclusively this gas;*
- *The country's gas supply is practically in MOL's hands, the gas distribution companies buy gas from MOL, as there is no other more economic way. It is very obvious, that new market player cannot enter the market without the approval (interests) of MOL and Gazprom (an example of this is RoszUkrEnergo or EMFESZ)".*

¹²⁹ Although according to the HEO, due to the 3,000 kilometres pipeline planned, gas from the Middle East is not likely to be cheaper than the Russian gas.

- (334) Gazprom already supplies through Panrusgáz, its joint venture with MOL, gas quantities covering most of the needs of Hungary. The Commission believes that it is not possible to purchase gas from Gazprom to compete with MOL WMT: first, Gazprom has no incentive to sell gas to another gas trader at a cheaper price that would compete with the quantities it sells to MOL WMT through Panrusgáz and the quantities sold would simply displace the quantities it already sells for the Hungarian market¹³⁰; secondly, the only incentive would be if Gazprom could sell gas at a higher price. However, the gas Gazprom would sell at a more expensive price would not be competitive in Hungary unless the entrant was able to operate at a lower cost than MOL WMT, in spite of the latter's incumbency advantages, or if the price was not substantially higher.
- (335) In other words, it appears that Gazprom has no incentive to supply additional competitive gas to E.ON or any other operator(s) to the extent that it only risks displacing/out-pricing its current sales.
- (336) If anything, MOL WMT's privileged access to Russian gas (due to Gazprom's current lack of incentives to support independent entry of competitors of MOL WMT) will be strengthened due to the privileged relationship and strategic partnership between Gazprom and E.ON. In view of the fact that access to competitive gas (namely Russian gas or CIS gas transiting through Russia) is the main barrier faced by new entrants, the Commission believes that the new entity will be no less, or even more, dominant after the transaction, compared to MOL WMT prior to the transaction.
- (337) It is indeed even less likely that Gazprom would support the massive entry of a competitor of MOL WMT after the transaction in light of the close links and strategic partnership of Gazprom and E.ON. In particular, E.ON has a 6.5% ownership in Gazprom¹³¹ and has a representative at Gazprom's Board of Directors. The two groups have entered into various large scale and long-term supply agreements and intend to further expand their cooperation in various areas, as stated in [...]*. There also appears to be an agreement signed between Gazprom and E.ON to coordinate moves related to privatization of gas industry facilities, transit gas pipelines in Slovakia, Czech Republic and Hungary¹³².
- (338) In addition, the Hungarian press recently referred to plans of Gazprom to become a shareholder in MOL WMT or in other E.ON downstream subsidiaries¹³³. This is [...]*¹³⁴. E.ON has [...]*¹³⁵.

¹³⁰ A third party active in gas has stated that “*Supply in Hungary is dominated by Panrusgáz which buys from Gazprom. We do not think that a merger would change the situation as on the one hand long term supply contracts exist and on the other hand Gazexport has a stake in Panrusgáz. We do not think that Gazexport will create its own competition by supplying gas to new companies at lower prices.*”

¹³¹ E.ON has a 3.5% direct shareholding in Gazprom and a 3 % indirect shareholding through the Gerosgaz JV, an OOO Gazexport and Ruhrgas AG JV, created in 1999.

¹³² See Gazprom's website <http://www.gazprom.ru/eng/articles/article8925.shtml>, as of July 6, 2005.

¹³³ See, e.g. Agence France Presse of 1 April 2005 *Gazprom intéressé par 11,8% de MOL*.

(339) It is fair to say that E.ON (which will take over MOL WMT's position as Gazprom's partner in Hungary after the implementation of the transaction) is a more significant and valuable partner of Gazprom than MOL was prior to the transaction for several reasons. E.ON purchases greater volumes of gas from Gazprom in Europe and, given its extensive presence in European markets, is a more privileged partner than MOL to help Gazprom achieving its strategy to enter downstream European gas markets. Furthermore, as regards gas transportation, Germany, due its central position in Europe, is an essential transit country to reach significant gas markets, in particular France and the UK¹³⁶. Finally, E.ON (along with Wingas) will be a partner of Gazprom for the construction of major new pipeline between Russia and Western European markets (Baltic pipeline).

(340) In conclusion, no competitor of MOL WMT can enter the Hungarian gas market without the approval and support of Gazprom and E.ON/MOL and at most only for limited quantities corresponding to the future "supply gap" in Hungary. The table and charts below illustrate this "supply gap" and evidence the limited possibility for additional gas imports into Hungary:

<i>Data in million m³</i>	Total Hungarian gas demand	Hungarian domestic production	Total import quantities forecasted by E.ON/MOL under long-term contracts	"Supply gap"
2005	[13000-20000]*	[1000-3000]*	[11000-13000]*	[0-4000]*

Source: E.ON's reply to the Commission's request for information of 18 July 2005, Annex 21

¹³⁴ Niederschrift über die Sitzung des Vorstands der E.ON Ruhrgas International AG am 9. August 2004, per Telefonkonferenz, Vorlage für den Vorstand, p. 7, Annex 8 of Form CO.

¹³⁵ Response of E.ON of 10 May 2005 to question 19 on draft Form CO.

¹³⁶ See, e.g., article "Russian' energetic enigma" in The Economist of 6 October 2005: "Last month, Mr Putin and Gerhard Schröder, Germany's chancellor, presided over the launch of Gazprom's latest mega-project: a €4 billion (\$5 billion) pipeline that will run under the Baltic Sea to Germany, Gazprom's biggest foreign customer, and thence, eventually, to Britain. Mr Putin again extolled the scheme's importance at the EU-Russia summit this week. Almost half of the European Union's gas imports come from Russia. European demand is expected to double between 2000 and 2030. Gazprom and the Russian government say that the Baltic pipeline is a useful way to diversify supply routes to a growing market."

Hungarian gas supply

[...]*

Source: E.ON's reply to the Commission's request for information of 18 July 2005, Annex 21

(341) The difficulty/marginality of “independent” entry is evidenced by the entry of EMFESZ, the only entrant so far, and the planned entry of CENTREX, while other more established Western European market players also outlined the difficulty to enter the Hungarian gas market.

EMFESZ

(342) EMFESZ is the only new entrant on the Hungarian gas markets as of July 2005. The company purchases gas from Turkmenistan and has gained half of the customers that have switched to the open segment of the market. The gas supplier of EMFESZ is RosUkrEnergó (also referred to as RosUkrGazprom¹³⁷), a Swiss-registered company owned 50% by Gazprombank and 50% by Raiffeissen Investment AG, an Austrian investment company¹³⁸.

(343) The market investigation has suggested that EMFESZ' entry has been facilitated by Gazprom and MOL WMT. It depends on MOL for its access to customers and infrastructures (in particular it depends on a gas swap with MOL WMT to meet the 80/20 rule)¹³⁹. The main customers of EMFESZ are MOL WMT ([0-2]* bcm/year, see Bothli-Trade contracts in the table in recital 325) and Nitrogenmúvek, an industrial customer that is allegedly managed by former MOL executives ([0-2]* bcm/year)¹⁴⁰. According to some market respondents, the other customers targeted and quantities supplied by EMFESZ are not so significant¹⁴¹. EMFESZ itself planned to supply 0.3 bcm of gas in Hungary in the first year of its entry and up to 1 bcm in the long term¹⁴². The company currently supplies approximately 0.5 bcm to

¹³⁷ See the article in the issue of 23 August 2005 of *European Gas Markets* (published by Heren Energy) “RosUkrEnergó's activities scrutinised”.

¹³⁸ It is however unclear whether EMFESZ can become a long-term player on the Hungarian gas market as its supplier RosUkrEnergó is being investigated in the Ukraine. See, e.g., front page article in the *Financial Times* of 27 July 2005 “Probe into criminal link to Gazprom company”; article in the *European Gas Markets* (published by Heren Energy) of 23 August 2005 “RosUkrEnergó's activities scrutinised”. As a result, some multinational customers indicated that they would not purchase gas from EMFESZ due to concerns as to its reliability and bad reputation

¹³⁹ Response of EMFESZ to Question 42 of the request for information of 3 June 2005; minutes of meeting with EMFESZ on 28 July 2005.

¹⁴⁰ To avoid any potential confusion, the Commission does not state that MOL has an ownership interest or voting rights in EMFESZ or in Nitrogenmúvek.

¹⁴¹ Response of Euro-Bridge to the request for information of 3 June 2005; minutes of the teleconference with Centrex on 9 August 2005.

¹⁴² Response of EMFESZ to Question 13 k) of the Commission's request for information of 19 July 2005.

other customers. EMFESZ's dependency upon/cooperation with MOL is confirmed by [...]*

CENTREX

- (344) Centrex Hungary is a start up company, wholly-owned by Centrex Europe Energy and Gas AG, an Austrian group founded in April 2004. The Hungarian subsidiary was created in September 2004 to start activities on the Hungarian energy markets. CENTREX does not yet have any trading activities or customers but has already planned its entry on the Hungarian gas markets and to reach sales of approximately 0.5 bcm the first year of its entry and 2 bcm in the long-term¹⁴⁴.
- (345) CENTREX has privileged access to competitive gas sources through its cooperation with Gazprom. In particular, CENTREX executives claim to have close personal relationships with Gazprom executives¹⁴⁵. In Hungary, the company intends to import gas produced by the Centrex group through gas consortiums with Gazprom (in that case it depends on Gazprom to transport its gas to the European markets of Centrex) and gas procured from Gazprom. The company is currently negotiating its gas supply agreements with Gazprom.

Western European market players

- (346) The other European importers/wholesalers which already purchase gas from Gazprom at delivery points close to Hungary (such as GDF, OMV and ENI/Italgas in Baumgarten) do not appear to be potential competitors of MOL WMT¹⁴⁶. The main reason is that gas available at Baumgarten is not competitive in Hungary. To compete with MOL WMT, these operators would need a more competitive portfolio of gas, with a significant proportion sourced at the Eastern entry point, but Gazprom would most likely not allow these companies to enter the Hungarian gas market (with additional gas sourced at the Eastern border) at the detriment of Panrusgáz and MOL WMT, as explained above in recitals 333 to 340.
- (347) This is confirmed by MOL WMT's internal documents that [...] the risk of new entries in Hungary and [...] E.ON/MOL WMT essentially focuses on the access to gas of the new entrants on the Hungarian gas market when assessing their respective position and strengths, as evidenced by the table below¹⁴⁸:

¹⁴³ Minutes of the Executive Board of MOL of 6 April 2004.

¹⁴⁴ Minutes of the conference call with CENTREX of 9 August 2005 and response of CENTREX to Question 13 k) of the Commission's request for information of 19 July 2005.

¹⁴⁵ Minutes of the conference call with CENTREX of 9 August 2005.

¹⁴⁶ See, e.g., the response of FŐGÁZ to question 30 d) of the request for information of 19 July 2005 as regards E.ON's position as potential competitor of MOL WMT: *“Die EMFESZ Kft., CENTREX Rt. und eventuell andere Marktteilnehmer mit günstigen östlichen Bezugsquellen hätten bessere Chancen als die E.ON in einer Grosshändlerrolle gehabt.”*

¹⁴⁷ Report to the Supervisory Board of MOL of 2 June 2003, Budapest, “Gas Business Situation”, slide 6.

¹⁴⁸ Response of E.ON to Question 87 of the request for information of 18 July 2005 and Annex 87.

[...]*

- (348) Finally, even assuming that other operators could have access to sufficient quantities of gas at the Eastern entry point, the market investigation has clearly shown that MOL WMT controls and saturates the Eastern entry point¹⁴⁹. There are currently no available free capacities at the Beregovo entry point¹⁵⁰. As shown above in recital 34, almost all capacities are booked by MOL WMT, as well as by the Serbian company Nis and the Bosnian Herzegovinan company BHGas for transit.
- (349) Accordingly, the Commission believes that access to gas from Russia/CIS countries at Hungary's Eastern entry point is essential to compete on the Hungarian gas markets. These gas sources and/or their transport to Hungary is controlled by Gazprom, which supplies gas to MOL WMT, its partner in the country. As evidenced by the parties' internal document, access to competitive gas from Russia / CIS countries therefore constitutes a strong barrier to entry on the Hungarian gas markets.

d. The parties' reply to the SO as regards access to competitive gas imports

Gazprom incentives

- (350) In their reply to the SO¹⁵¹, the parties go a long way to try to “*demystify*” the “*special relationship*” between E.ON and Gazprom, as described by the Commission. The parties' argument is two-fold.
- (351) Firstly, it is argued that the Commission is mistaken in considering that the 6,4% shareholding and E.ON's having one representative in Gazprom's supervisory board do imply that the relationship between the two companies is “special”. To do so, the parties describe other allegedly “special” relationships that Gazprom would have with other Western companies.
- (352) However, what clearly emerges from the parties' line of argument is that none of the other Western companies has a shareholding in Gazprom and/or one representative

¹⁴⁹ See, e.g., the response of GDF to Question 29 g) of the request for information of 19 July 2005.

¹⁵⁰ Minutes of the meeting of 26 July 2005 with the HEO. According to the HEO, the Beregovo entry point is contractually congested (and physically congested in winter), as capacity is booked but not fully used. This contractual congestion is caused by transit. Transit flows to Serbia have seasonal variations because there is no storage capacity in Serbia, so that the transit capacity booked is not fully used during summer. The HEO wanted to force MOL Transmission to use the capacities booked for transit but not used for transit during the summer on the basis of use-it-or-lose-it principle but MOL Transmission brought the demonstration that under their long-term transit contract with the Serbian operator (the capacity is booked on a ship or pay firm basis and the Serbian operator paid for the cost of network development), MOL Transmission cannot use unused capacity for Hungarian transport needs.

¹⁵¹ Parties' reply to the SO, II.3.1, pages 11-13 and annex 1, pages 12-13.

in its supervisory board. These two elements, by themselves, suffice to qualify the E.ON/Gazprom relationship as “privileged” as compared to other allegedly “special” relationships.

- (353) Moreover, the parties have not even attempted to dismiss (and not even commented upon) the information contained in paragraph 341 of the SO as regards the possibility that E.ON and Gazprom may agree on Gazprom’s acquiring a [...]*.
- (354) To the Commission’s understanding, all this provides sufficient ground for considering the E.ON/Gazprom relationship as “privileged”, in spite of the parties’ arguments and attempts to dismiss such claims.
- (355) Secondly, and most importantly, still with the objective to “*demystify*” the E.ON/Gazprom relationship, the parties argue at length that, regardless of the nature of the relationship between the two companies and also in the absence of the transaction, Gazprom would have no financial incentives to “*undermine the price in existing contracts*”. The parties even quote, as confirmation of their analysis, the Commission’s statement that “*it is not possible to purchase gas from Gazprom to compete with MOL WMT: first, Gazprom has no incentive to sell gas to another gas trader at a cheaper price that would compete with the quantities it sells to MOL WMT through Panrusgáz and the quantities sold would simply displace the quantities it already sells for the Hungarian market*”¹⁵².
- (356) The parties’ argument is simple: “*if matters are so bleak, they cannot get any worse*”. Hence, it is argued that at any rate the “*special relationship cannot make matters worse*”.
- (357) The Commission believes that by developing this line of argument the parties have in fact blatantly supported the Commission’s assessment of MOL and E.ON relationship with Gazprom and the strategy and incentives of Gazprom for the supply of gas to Hungary.
- (358) As a matter of fact, even assuming (for the sake of the argument) that the E.ON/Gazprom relationship is not “privileged”, what really matters here is that the essential change brought by the proposed transaction is the creation of a fully vertically integrated entity along the gas and electricity supply chains.
- (359) While MOL WMT, even prior to the transaction, had the ability to exploit its dominant position in gas, it lacked any incentives to do so. In the pre-transaction scenario, Gazprom’s “financial incentives” not to sell gas to competitors of MOL WMT at lower prices than in existing contracts (as described by both the Commission and the parties) would not give rise to the risk of foreclosure. In the post-transaction scenario, the combination of Gazprom’s “financial incentives”, which would remain unchanged, and E.ON’s incentives, which would change, as compared to MOL’s, would directly result in the new entity having the ability and the incentive to significantly impede competition by foreclosing access to gas resources.

¹⁵² SO paragraph 338.

- (360) In conclusion, the Commission first notes that the parties' reply to the SO confirms the assessment in the SO on access to competitive gas for import into Hungary and Gazprom's lack of incentives in supplying gas to other companies in competition with the new entity. Secondly, the Commission does not state that E.ON's privileged relationship with Gazprom will dramatically change the possibilities to import competitive gas in Hungary but simply that it will further limit Gazprom's – already low – readiness to supply others competitors.

Availability of competitive gas in Baumgarten for import into Hungary

- (361) In their reply to the SO, the parties dispute the SO's conclusion that competitors of MOL WMT cannot enter the Hungarian wholesale gas market from Baumgarten. According to the parties, several large players in the European gas industry import gas via Baumgarten and could easily divert their imports to the Hungarian gas market. According to the parties, this will be made possible by the upcoming significant gas surpluses which these players will face and the upcoming removal of price regulation in the market to eligible customers in Hungary¹⁵³. According to the parties, Baumgarten (as the marginal entry point) will attract additional imports if Hungarian demand cannot be satisfied through imports made at the Eastern border.
- (362) The Commission first notes that the parties do not dispute that currently MOL WMT is more competitive due to its portfolio of existing long-term gas supply contracts¹⁵⁴, and arguably, that the new entity would immediately after the transaction have the ability to discriminate its downstream competitors. In addition, the parties do not dispute that the price of gas available in Baumgarten is higher than MOL WMT's gas prices under its portfolio of existing supply agreements.
- (363) The parties however take the view that, at a later stage, imports made through Baumgarten will become competitive. There appear to be three pre-requisites for the competitive scenario presented by the parties in their reply to the SO to unfold: (i) there must be significant gas surpluses that could be diverted to Baumgarten; (ii) there must be significant entry capacity available at Baumgarten; and (iii) there must be price and regulatory changes in Hungary.
- (364) The competitive scenario presented by the parties appears speculative and indirect at best and does not address convincingly any of three pre-requisites mentioned above in recital 363.

i) Gas surpluses that could be diverted to Baumgarten

- (365) The Commission has not found any compelling evidence as regards the existence or the development of significant gas surpluses that would corroborate the scenario presented by the parties' expert.

¹⁵³ Reply to the SO, II.1.1, page 6.

¹⁵⁴ MOL WMT's current gas sourcing portfolio is comprised at 90% of Russian and Turkmen gas at advantageous prices, which is for 81.4% imported through the Eastern entry point.

- (366) First, it is worth recalling that this scenario is in contradiction with MOL WMT's own internal documents quoted at paragraph 349 of the SO, that [...] ¹⁵⁵. The parties do not even try to explain this contradiction.
- (367) Secondly, as mentioned above in recitals 355 and 357, the parties do not dispute the argument developed in the SO that Gazprom has no financial incentives to supply at Baumgarten additional volumes of gas for the Hungarian market. This is because by doing so Gazprom would be undermining Baumgarten prices under existing contracts and supporting independent entries in competition with Panrusgáz/MOL WMT. The expert report provided by the parties even develops further the reasons why Gazprom has no financial incentives to sell gas to competitors at lower prices than in existing contracts and undermine Baumgarten prices:

“Assume that Gazprom signs a contract with MOL WMT at a high price, and then starts selling gas to a second importer at a low price because the relationship with MOL was not sufficiently special. The new importer could profitably reduce the gas price in Hungary. However, Gazprom would suffer as a result, as its low-priced sales to the second importer would displace the volumes that Gazprom previously sold to MOL. Gazprom would also risk facing demands by MOL to renegotiate the price. The standard European gas contract contains “price re-opener” provisions that protect buyers. The reduced price to the second importer would permit it to sell gas at a discount in Hungary. The discounts would prompt MOL WMT to complain that the market price in Hungary was falling, that the decrease lay beyond MOL's control, and that the gas price charged by Gazprom should fall to the level necessary to restore MOL's profitability. If Gazprom disagreed, MOL could have a neutral arbitrator evaluate the claim. (...)

[T]he discussion above suffices to establish Gazprom's incentives. If Gazprom starts selling gas at €1/MWh less than the price under existing contracts, then Gazprom will face two consequences. First, Gazprom will lose €1/MWh on every sale by the new importer who displaces the sale of high-priced gas by existing importers. Second, Gazprom will face the prospect of claims by the existing importers, to reduce the Baumgarten price by €1/MWh. Gazprom therefore opens up the prospect of selling gas to everyone in the market at €1/MWh less than previously. Gazprom's incentives are simple: sell as much gas as possible without undermining the price in existing contracts.”

- (368) As Gazprom is not willing to supply additional gas in competition for the volumes of gas it already supplies via Panrusgáz for the Hungarian market, only operators which *already* have access to competitive (Russian) gas at or near Baumgarten could be in a position to divert this gas to Baumgarten for supply in Hungary. Indeed, other operators with gas delivered far from Baumgarten would incur significant costs of transport to Hungary, which would make such imports non-competitive (assuming that the necessary transit capacity would be available and not fully booked under long-term capacity reservation agreements).
- (369) However, it appears that none of the operators having gas in Baumgarten has significant volumes of gas which it could divert to supply the Hungarian gas markets. In particular, earlier expectations of a gas bubble in Italy, on which the

¹⁵⁵ Report to the Supervisory Board of MOL of 2 June 2003, Budapest, “Gas Business Situation”, slide 6.

parties rely to a great extent in their reply to the SO, no longer appear likely, on the basis of the latest information from the Italian energy regulator¹⁵⁶. ENI has been able to renegotiate its gas supply agreement with Gazprom and to reduce the level of its take-or-pay obligations¹⁵⁷. It appears that gas volumes available to other gas market players in Baumgarten are fully committed under existing long-term supply agreements with other traders/customers, so that these operators would need to source additional volumes from Gazprom to be able to enter the Hungarian gas market¹⁵⁸.

- (370) Thirdly, the parties' arguments about surpluses of gas in Western Europe and their export to Hungary do not appear to rely on any solid evidence. The only figures provided to show the existence of gas surpluses are in another study¹⁵⁹ which the expert report refers to. The figures provided by the expert are either misinterpreted or irrelevant for the present case. For example, the report provides data on the capacities of LNG terminals in the South of France and discusses capacities of LNG terminals on the US Gulf Coast, which appear to the Commission of little relevance for the supply of gas in Hungary. In the same way, the graph presenting the balance between supply and demand in Italy (Figure 1, Page 8) clearly shows that TOP supplies are in line with the countries' projected demand, although the report uses it to show the (allegedly) excess of contracted gas over projected demand in Italy.
- (371) The expert report provided by the parties states (without any concrete evidence) that there are (will be) gas surpluses in various Western European countries, in particular Spain, Italy and the UK. This would result in gas companies diverting these surpluses to other European countries, in particular France, and would in turn create gas surpluses in France. ENI/Italgas and GDF would then use these surpluses for export into Hungary (Pages 1 to 9 of the Expert Report). As mentioned, this competitive scenario appears at best indirect, and presupposes that all the circumstances on these other European markets be met. The Commission notes that none of these circumstances or their causal relationship is demonstrated by the parties. All the relevant factors that would have to be assessed to support the parties' far-reaching conclusions are not mentioned (let alone analysed) in the report: evolution of gas demand in several European countries and their determining factors, evolution of the competitive environment of the gas sector in several European countries, development of new gas transport infrastructures, etc.
- (372) In addition, it appears speculative to assume that any excess volumes (assuming there will be gas surpluses) would be diverted specifically to Hungary and not to

¹⁵⁶ See e-mail of 24 October 2005 from the Italian regulator, Autorità Energia.

¹⁵⁷ See, inter alia, Financial Times article of 21 October 2005 "*Gazprom and Eni axe 'outdated' gas deal after contract dispute*": "*Eni will be anxious in any new agreement to preserve significant financial concessions that it won from Gazprom concerning the remainder of the gas that it purchases. Gazprom offered to extend the contract on the gas by 10 years to 2027 with its existing price-setting mechanisms and change a crucial "take-or-pay" clause that could save Eni millions of euros if the gas price fluctuates.*"

¹⁵⁸ [Confidential: Statements on gas quantities available in Baumgarten for a certain gas operator]

¹⁵⁹ Frisch, Carpenter and Lapuerta: "The Advent of US Gas Demand Destruction and its Likely Consequences for the pricing of Future European Gas Supplies", March 2005

other gas markets with a higher price level. For example, according to E-Control, the Austrian Energy Regulator, the largest part of the gas quantities sold in Econgass' auctions in 2005 was exported to Italy. The Commission therefore concludes that it is currently economically more interesting to export gas available in Austria to Italy than to Hungary. Finally, although it discusses the current and future developments of European gas markets, the other study to which the expert report refers does not even mention the possibility that these surpluses could be exported to Hungary¹⁶⁰.

- (373) In view of the above, it appears that the parties' allegations on potential gas surpluses that would be diverted to Hungary through Baumgarten are largely speculative. They are neither supported by any evidence brought forward by the parties nor by the information gathered by the Commission in the course of its extensive market investigation.

ii) Availability of entry capacity into Hungary

- (374) In Hungary, the Western entry point has only a 4.5 bcm/year import capacity while the Eastern entry point has approximately an 11 bcm annual capacity for imports into Hungary (4 bcm are reserved for transit). Therefore, in any event, the bulk of the gas used in Hungary will still be imported by MOL WMT (and other new entrants to the extent of Gazprom's support) through the Eastern entry point in the medium term.

- (375) In order to import gas from Baumgarten, potential new entrant would have, in addition to sourcing gas, (i) to book transport capacity on the HAG pipeline between Baumgarten and Hungary and (ii) to book cross-border transmission capacity at the Hungarian Western entry point. The market investigation showed that both of these capacities would be difficult to obtain due to the significant share of capacities already booked by MOL.

- (376) With respect to the HAG pipeline, the Commission believes that new entrants may face difficulties in obtaining access to transport capacity. As an example, E-Control, the Austrian regulator reported to the Commission:

“At present system access is on the basis of negotiated contracts, and is not regulated. Because of this no information is available as to how long-term transport rights on the transit pipeline are assigned, i.e. who has access to which second-level

¹⁶⁰ The above-mentioned study of Frisch, Carpenter and Lapuerta takes the view that the construction of planned LNG terminals will nevertheless proceed in the UK, and that, as surplus emerges, UK developers will try to re-export to continental markets through the Bacton-Zeebrugge Interconnector and the Bacton-Balgzand pipeline being constructed. The study also foresees the emergence of surplus in Italy, which Italy will try to avoid by reducing its imports and selling the excess gas via backhaul to countries located to its north and west, through which transit pipes serving Italy pass, namely Austria, Germany, France and Switzerland. The Spanish gas surplus could only be dealt with through onward sale of LNG cargoes (as Spain has limited pipeline capacity with France and therefore fewer opportunities to serve Northern European markets through the backhaul of pipeline gas). The Spanish oversupply (in the form of surplus LNG cargoes) could influence gas markets in North West Europe as well as Italy.

The disclaimer accompanying this study emphasizes that it only reflects a correct view of the current situation and future developments in US and European markets at the time of its drafting in late 2004 and early January 2005, that no representation or warranty is made as to the accuracy or completeness of the presentation and that no person is entitled to rely on its content.

wholesale markets (Germany, Italy, etc.). It is difficult for new entrants to obtain access to transit pipelines. No capacity is currently reserved for new customers on any of the cross-border pipelines."¹⁶¹

- (377) The Commission has analysed existing capacity bookings on the HAG provided by the OMV, the operator of the pipeline. [Confidential: Data on capacity bookings on the HAG pipeline].
- (378) The situation is similar for the cross-border capacity at Hungary's Western entry point. In this regard, the expert report fails to recognize that potential new entrants through the Western entry point would also face severe capacity constraints. The report indicates that "[u]nder the capacity allocation rule, the full 4.5 bcm could become available to competitors". This statement is misleading as MOL WMT has already booked a significant part of the cross-border capacities ([2-5]* bcm out of 4.5 bcm/year, or [5-15]* million m³/day out of 12.3 million m³/day) for its import contracts¹⁶². This situation is not expected to change in the medium term as Already Allocated Capacity has priority under the cross-border capacity allocation rules. MOL WMT requires in any case a significant part of the Western entry point capacity to perform its obligations under its gas import contracts and their related TOP obligations.
- (379) Finally, according to the parties, MOL WMT is also planning to conclude a [5-15]*-year cross-border capacity reservation agreement with MOL Transmission. Such long-term capacity bookings will have priority over new requests for capacity, and could prevent access by other market players to the necessary entry capacity on HAG.
- (380) In view of the above, the Commission concludes that only limited transmission capacities are available on the HAG pipeline and at the Hungarian Western entry point. It would therefore be difficult (and even impossible for large quantities) for a new entrant to obtain sufficient transmission capacities to import gas from Baumgarten into Hungary and become active on the Hungarian gas markets.

iii) Price and regulatory changes in Hungary

- (381) The expert report submitted by the parties introduces the concept of "*marginal entry point*" to explain that gas imported through the Baumgarten entry point would become competitive in Hungary when current price regulations are lifted. According to the expert report, Hungary has in any case to import gas from Baumgarten (as total demand is higher than the Eastern entry point capacity) and this gas will set gas prices in Hungary as the "*marginal gas*". According to the parties¹⁶³, current gas regulated prices in Hungary lead to a significant price differential between price

¹⁶¹ E-control, Press-briefing on the investigation of the Austrian gas industry under the Competition Act 2002, Vienna, 27 September 2005, page 6, "Access to interconnector capacity into Austria".

¹⁶² Paragraph 25 of the SO; see also response of E.ON to question 9 raised in the Commission's e-mail of 14 October 2005 which shows that MOL WMT has booked [5-15]* million m³/day at the HAG entry point for the gas year 2005/2006.

¹⁶³ Reply to the SO, Annex II, p. 2 (comment concerning paragraph 346 of the SO), and E.ON's submission of 21 October 2005, part III and Annex 12.

levels for gas available in Baumgarten and gas supplied within Hungary, which will disappear once regulated gas prices are terminated.

- (382) While the Commission agrees that gas will continue to be imported into Hungary through the Western entry point, it is clear that competitors that would import gas only from the Western entry point would be at a competitive disadvantage compared to MOL WMT, which would have a lower average cost of gas over its portfolio (due to its imports of Russian/Turkmen gas at cheap prices, and principally through the Eastern entry point). The Commission also refers to its previous analysis of transmission cost through Slovakia and on the HAG pipeline for gas imported through the Western entry point. Therefore, the fact that Baumgarten will constitute a “marginal entry point” does not mean that competitors having only access to this gas resource can compete effectively with MOL WMT in Hungary given their higher sourcing cost.
- (383) With respect to cross-border transmission tariffs, the parties claim that the current regulatory framework (equalised entry/exit tariff at the Western and Eastern entry points) penalizes imports of gas through the Western entry point as compared to imports through the Eastern entry point. According to the parties, this situation will change once a differentiated entry/exit tariff is introduced by the HEO. Such new entry/exit tariff would equalise gas prices (import prices plus entry/exit tariffs) at the Western and Eastern entry points. However, it would be difficult to equalise gas prices at the two entry points through differentiated tariffs given the significant price differential between import prices. In addition, there are currently no clear plans of the HEO to introduce differentiated entry/exit tariffs and this would in any event not take place before 2008¹⁶⁴.
- (384) In view of the above, the Commission believes that the price differential between gas imported through Hungary’s Western and Eastern entry point is essentially structural (cost of transmission through Slovakia and Austria) and it is not expected to be removed by upcoming changes in the regulatory framework in the medium term. As a consequence, even if Baumgarten were to act as “marginal entry point”, MOL WMT will continue to benefit from a significantly lower cost of gas as compared to any potential competitor importing gas from Baumgarten.

Existence of independent importers in the Hungarian wholesale gas market

- (385) In their reply to the SO¹⁶⁵ the parties argue that the Commission “*tries to belittle*” the “*significant entry*” of “*independent*” companies like EMFESZ and CENTREX.
- (386) To do so, the parties on the one hand contest the Commission’s argument that both companies are not truly “independent” from Gazprom and on the other hand claim that their market entry demonstrates that Gazprom has no intention to prevent “*at all cost independent market entry which reduces the margin earned by Panrusgáz*”.

¹⁶⁴ E-mail of the HEO of 20 October 2005.

¹⁶⁵ Parties’ reply to the SO, II.3.2, pages 13-16

- (387) However, the parties' argument as regards the entry of EMFESZ and CENTREX on the Hungarian market is not new to the Commission and has been factored in its assessment of the proposed transaction. As a matter of fact, the whole range of arguments and quotations put forward by the parties is rebutted by in paragraph 342 of the SO, where the Commission states that *"no competitor of MOL WMT can enter the Hungarian gas market without the approval and support of Gazprom and E.ON/MOL and at most only for limited quantities corresponding to the future "supply gap" in Hungary"* (emphasis added). As a matter of fact, the parties fail to acknowledge that the long term plans of expansion for both EMFESZ and CENTREX match very closely the figures as regards the "supply gap" highlighted by the Commission. If one adds the [0-3]* bcm, representing CENTREX' long-term sales plans¹⁶⁶, and the [0-3]* bcm of long-term forecast sales by EMFESZ¹⁶⁷, the result is approximately the long-term "supply gap" as elaborated by the parties.
- (388) Moreover, as regards EMFESZ, the parties fail to acknowledge that [0-3]* bcm of EMFESZ current sales are destined to MOL, as indicated in paragraph 339 of the SO. It therefore appears groundless for the parties to emphasize that EMFESZ *"was able to independently import more than [0-3]* bcm"*, that it has built up a *"significant position"* in less than 2 years and that this volumes represent *"20% of the Hungarian gas demand by industrial and commercial customers as well as power plants"*. The Commission also refers to the swap agreement between MOL and EMFESZ and the other elements (see above in recital 343) that call in question the *"independent"* character of EMFESZ's entry. As regards CENTREX, the Commission underline that the company is not active on the Hungarian gas market yet and that its 2-2.5 bcm long term sales plans should be taken for granted.
- (389) To conclude, the Commission estimates that the parties' remarks on Gazprom incentives, the availability of competitive gas in Baumgarten and the existence of independent new entrants are insufficiently supported by evidence and do not reflect accurately the current and future competitive situation of the gas sector in Hungary. Based on the information provided by the market investigation and its assessment thereof, the Commission therefore concludes that MOL WMT controls competitive import sources in Hungary prior to the transaction.
- (iii) *MOL WMT enjoys further significant incumbency advantages*
- (390) In addition to a privileged access to competitive gas sources, MOL WMT enjoys significant incumbency advantages in terms of security of supply, cost of transmission and storage of gas.
- (391) The market investigation has shown that to compete in Hungary, it is necessary to have access to gas and transmission capacity at both entry points, which only MOL WMT, the incumbent, has. This is necessary to ensure the security of supply of the clients. According to a third party active in gas, *"having only one point of importation is not enough to secure a satisfactory supply to clients in case of reduction or force majeure at [HAG], as it happened in 2004 for example"*. *"The*

¹⁶⁶ See report of teleconference with Centrex of August 2005, page 2

¹⁶⁷ See response of EMFESZ to Question 13 k) of the Commission's request for information of 19 July 2005

consequence of Force Majeure (i.e. any unpredictable event that makes the gas flow impossible or reduced) at [HAG] for a newcomer who is not allowed to contract through Beregovo because of saturation are important: (i) financial, as the newcomer will not be able to supply the gas quantities for its clients through another delivery point, he could be under strong penalties with MOL Transmission; (ii) commercial image will be deteriorated in front of the clients who will lose confidence.”¹⁶⁸

- (392) The expert report provided by the parties in their reply to the SO disputes the fact that simultaneous access to gas at both entry points is required for successful competition. According to the report, the Hungarian gas network code permits reliable participation in the market from just one entry point. In case of technical problem at the entry point, a gas supplier would not be penalised as “firm” transmission capacity implies that it is the TSO’s responsibility to deliver the gas injected at the Western entry point for example. If the TSO fails to do so, the Hungarian network code waives any imbalance penalties and it puts all customers on an equal footing with respect to potential curtailments of consumption in the event of a network failure. A supplier with access to gas from different sources would have the same likelihood of interruption as a competitor operating exclusively from Baumgarten in case of a problem on the transmission network.
- (393) The Commission agrees that the provisions of the Hungarian network code described in the expert report ensure that a supplier with access to only one entry point is not penalized in case of network failure. However, that supplier’s liability is not protected in case of problems with access to gas upstream of the Hungarian transmission network, which would not be the responsibility of the Hungarian TSO. It thus remains important for reliability and safety of supply to have access to gas at more than one entry point in the country (Hungary has only two entry points for gas, most countries have several entry points for gas). It remains true that a supplier which is not able to ensure back-up gas from an alternative entry point would face high imbalance penalties and damage to its reputation. Therefore, a supplier having access to gas at the two entry points benefits from a strong competitive advantage in term of security of supply, one of the most important criteria customers consider to select their gas supplier.
- (394) Similarly, due to its position as gas incumbent, MOL WMT is the only gas operator that has several gas supply contracts with delivery points at the Hungarian borders. This means that only MOL WMT can fully benefit from the advantages resulting from a diversified gas supply portfolio and optimize its sourcing in terms of prices and flexibility provisions notably.
- (395) Furthermore, as a direct result of its large size in Hungary and its incumbency position, the new entity has a competitive advantage in terms of costs of transmission and storage of gas vis-à-vis new entrants on the Hungarian gas markets. This constitute an additional barrier to entry on these markets. For example, it appears that balancing rules are biased in favour of the incumbent in Hungary: a gas

¹⁶⁸ Response of OMV to Question 17 of the request for information of 19 July 2005: “Due to the fact that E.ON/Ruhrgas will have gas and import capacity available at the Ukrainian and Austrian borders, it will be in the best position to use the 80-20 percent division of capacity stipulated in the grid and commercial code (cf. point 5.1.2.). This might at least put it in a favourable position to an outside competitor.”

trader licensee that can provide the TSO daily gas options can avoid paying a nomination penalty for deviations of up to +/- 8% from daily nominations. At this stage, only MOL WMT can provide such flexibility, thanks to its huge source portfolio. Other gas traders, which cannot offer such daily flexibility, have only a tolerance of +/- 2% for deviations and thus have to pay high imbalance penalties for any deviation exceeding 2%¹⁶⁹.

- (396) Similarly, MOL WMT benefits from a synchronicity effect for its transmission and storage capacity bookings due to its large portfolio of customers¹⁷⁰. A supplier with a large and diversified customer base needs lower transmission and storage capacities per customer than a supplier with a limited number of customers as the overall variation in demand of a large number of customers is lower on average than the sum of the variation in demand of each individual customer¹⁷¹. According to the HEO *“for daily balancing, it is necessary to have flexibility of sources and to be able to take import sources as needed. MOL WMT has a larger flexibility due to its huge customer base and because it has all the imports. The other traders have to buy their flexibility from MOL WMT in order to serve the specific needs of their new customers. (...) The Public Utility Wholesaler is well equipped to offer flexibility schemes for the remaining players, but this is done in a way in the least possible advantageous way for the small players.”*¹⁷²

Conclusion on the new entity’s dominant position in the wholesale supply of gas in Hungary

- (397) For the reasons set out above, already before the transaction, MOL WMT is dominant on the different Hungarian wholesale gas markets identified in the market definition section (the market for gas supply to RDCs, the market for gas supply to traders and the market for gas supply to large power plants). According to the Commission, MOL WMT’s dominance does not result from the transaction. However, the Commission disagrees with the parties’ view that *“the proposed transaction does not bring about any relevant change to this situation”*¹⁷³.

¹⁶⁹ See also minutes of the meeting of 26 July 2005 with the HEO (comments on slide 17 of the presentation entitled “The Hungarian Natural Gas Market: Storage and miscellaneous questions”): *“Furthermore the penalty for imbalance imposed by the TSO (MOL Transmission) is high. Although the penalty is lessened if the player can offer another flexibility tool, this system works obviously against the small players who cannot offer flexibility schemes for the TSO.”*

¹⁷⁰ A third party active in gas has stated that *“Being able to gain market share means not only to have competitive prices for importation, but also to be able to import enough quantities of gas to benefit from scale effects, and also to lower transportation and balancing costs by access to multiple delivery points.”*

¹⁷¹ This results directly from the fact that, in a large pool of customers, not every customer has its peak demand at the same point in time. The peak in demand of the aggregate demand of the pools (which is relevant for the transmission and storage capacity booking) is hence lower than the sum of the peak demands of each customer in the pool. More generally, the larger the number of customers in the pool, the lower is the relative fluctuation of the aggregate demand.

¹⁷² Minutes of the meeting of 26 July 2005 with the HEO (comments on slide 17 of the presentation entitled “The Hungarian Natural Gas Market: Storage and miscellaneous questions”).

¹⁷³ Reply to the SO, page 2.

B. Impact of the transaction on the gas markets

(398) The following recitals will focus on the effects of the proposed transaction on competition on the Hungarian gas markets.

(i) Supply of gas

(399) The new entity, like MOL WMT prior to the transaction, will enjoy a dominant position in the upstream markets for the supply of gas to RDCs and to traders. MOL WMT controls, through long-term procurement contracts and structural links the two existing competitive sources of gas, namely domestic production and imports from Gazprom. The essential change brought by the transaction is that E.ON, unlike MOL, is active in the retail supply of gas, through the two RDCs it controls and its participation in a third one.. Thus, the proposed merger will result in a vertically integrated company active across all stages of the gas supply chain and controlling access to gas volumes and part of the infrastructure.

(400) While, prior to the transaction, MOL WMT had the ability to act, to an appreciable extent, independently of its customers (i.e., RDCs and traders) in the wholesale supply of gas in Hungary, it lacked any economic incentives to act to their detriment as it was not present on the downstream gas retail markets and was not, therefore, competing with them. Conversely, E.ON had no presence in the upstream market and thus no power to act to the detriment of its downstream rivals. For the reasons stated below, the Commission considers that the vertical integration created by the transaction is likely to result in the new entity having the ability *and* the incentive to foreclose its actual and potential competitors on the downstream markets for the supply of gas so as to significantly impede competition thereon.

a. The new entity will have the ability and incentive to foreclose access to wholesale gas to its competitors (RDCs and traders) in gas retail on the market for the supply of gas to small industrial and commercial customers

(401) The Commission's analysis indicates that, as a result of and immediately after the transaction, the new entity will have the ability and incentive to foreclose access to gas to its current downstream competitors supplying retail gas to small industrial and commercial customers¹⁷⁴, thereby significantly impeding effective competition on these markets. Emerging entrants in the open segment of the market, including the trading arm of independent RDCs, would be obliged to rely on their strongest competitor to procure their wholesale gas, thus placing them at a competitive disadvantage. Further, the Commission is concerned that by deterring or delaying entry, the transaction will also prevent the effective opening of the market to competition despite its full liberalisation since 1 July 2004¹⁷⁵.

¹⁷⁴ Owing to different competitive and regulatory circumstances input foreclosure to gas-fired power plants is analysed separately.

¹⁷⁵ Pursuant to Directive 2003/55/EC and to the implementing provisions under Hungarian law (Article 36 of the HGA and Article 1(1) of the Eligibility Decree), all non-residential customers have become eligible and, accordingly, are free to choose their supplier.

- (402) Several market participants have pointed out the likelihood and the negative effects of such input foreclosure on effective competition and potential new entries. As stated by a third party active in the gas sector, as a result of the merger, “*E.ON would become monopoly wholesaler*” and “*through its vertical integration, would be able to control the upstream gas market and – thanks to its existing position on the retail gas market would be in a unique position to control the whole gas supply chain*”.

Ability to foreclose access to wholesale gas thereby raising the costs of competitors in the market for the supply of gas to small industrial and commercial customers

- (403) Input foreclosure here refers to the strategy of raising the costs of wholesale gas procurement to rival RDCs in the regulated segment and traders in the open segment of the market for the supply of gas to small industrial and commercial customers. Higher costs will reduce rivals’ profit margins and tend to reduce their ability to compete effectively in this retail market with the new entity. As a result, the new entity’s downstream rivals are likely to be marginalised and effective competition to be significantly impeded, allowing the new entity to gain increased market power and raise retail prices to the detriment of final small industrial and commercial customers.
- (404) Following the merger, the merged entity will have the ability to foreclose access to gas and raise its rivals’ costs in various ways. According to the Commission’s market investigation post-merger the new entity will first have the ability to deny access to gas resources and infrastructures to its downstream competitors on the market for the supply of gas to small industrial and commercial customers. A third party active in the gas sector points out for example that “*E.ON will be the only gas retailer who will have access to the TOP import contracts of MOL WMT and the domestic production of MOL E&P, so they will be able to control the gas resources in Hungary*”.
- (405) The dependence of gas traders affiliated with the RDCs on MOL WMT for their access to gas is evidenced by [...] ¹⁷⁶. This table (extracted from a table presented above in recital 347) shows that these traders have already asked for a bid of MOL WMT trader for their access to gas for the liberalised segment of the market (on the regulated segment of the market, MOL WMT Public Utility Wholesaler has for the time being the obligation to supply them):

[...]*

- (406) In the open segment of the market, the new entity could directly increase the wholesale price of gas to traders and/or engage in non-price discrimination. Non-price discrimination includes a whole range of actions intended to increase the costs of wholesale gas procurement to rivals, such as intentional delays in supply and in processing orders, reductions in the quality of service, lack of flexibility, reduced

¹⁷⁶ [...]*

transparency, unwillingness to renegotiate, etc. Non-price discrimination provides ways to raise rivals' costs even in the regulated segment of the market, where prices are regulated.

(407) The Commission's investigation has indeed revealed that safety of supply, flexibility and service guarantees are of significant importance for a small industrial and commercial customer in choosing its gas supplier. In turn retailers must ensure that they can receive the corresponding quality of service and supply guarantees from their respective wholesaler. Nomination penalty risk is also important for gas retailers.

(408) A number of market players have outlined the risk of non-price discrimination and have indicated the broad range of parameters on which the new entity would have the ability to discriminate its competitors. A third party active in the gas sector stated for instance:

“Besides the prices set in the supply contracts other contractual conditions may provide room for discrimination (e.g. terms of payments, capacity booking, synchronicity of customers' capacity needs, etc)”¹⁷⁷.

(409) E.ON would thus have the ability post-merger to influence the above-mentioned parameters of competition and to limit the ability of targeted retailers to compete on the downstream market for the supply of gas to small industrial and commercial customers.

Incentive to foreclose access to wholesale gas thereby raising the costs of competitors in gas retail markets

(410) Prior to the transaction, MOL WMT has no economic motive to discriminate among downstream gas players (i.e. RDCs and traders) active on the market for gas supply to small industrial and commercial customers as it has no gas retail activities. However, as a result of its vertical integration into gas retailing, the new entity will have the incentive, post-merger, to engage in input foreclosure strategies on the downstream market for the supply of gas to small industrial and commercial customers where E.ON is present, so as to favour its downstream affiliates and marginalise its rivals.

(411) The table below summarizes the current market shares of the existing RDCs on the market for gas supply to small industrial and commercial customers. No trader is active on this market so far.

¹⁷⁷ Submission of [...] dated [...].

Suppliers	Supply of gas to small commercial and industrial customers in 2004	
	In million m ³	In %
KÖGÁZ	[0-500]*	[10-15%]
DDGÁZ	[0-500]*	[5-10%]
Total E.ON	[0-500]*	[15-20%]
FÖGÁZ	[500-1000]	[20-30%]
ÉGÁZ	[0-500]	[0-10%]
DÉGÁZ	[0-500]	[10-20%]
TIGÁZ	[500-1000]	[30-40%]
MOL WMT	0	0%
Total Market	[2000-3000]	100%

- (412) E.ON has sole control of two RDCs (KÖGÁZ and DDGÁZ), which together represented nearly [15-25%]* of the sales on the market for the supply of gas to small commercial and industrial customers (< 500 m³/h) in 2004. Such market presence already gives the new entity a strong incentive to raise its current competitors' costs.
- (413) In addition, E.ON holds a 16.4% participation in FÖGÁZ, an RDC exclusively controlled by the municipality of Budapest, which represents more than 20% of the sales of gas on the market for the supply of gas to small commercial and industrial customers. If one also takes into account FÖGÁZ's sales, because of E.ON's financial interest therein, the merged entity's position on the retail market for gas supply to small commercial and industrial customers is even stronger (around [35-45%]*).
- (414) It is likely that, by pursuing an input foreclosure strategy as a result of which competing RDCs and traders will be marginalised because of higher gas costs, the merged entity will enhance its market position and gain increased market power on the market for the supply of gas to small commercial and industrial customers.
- (415) The market investigation has confirmed that the transaction would change MOL WMT's incentives in this way. In that respect, EDF has stated that: "*We believe that MOL/E.ON, in a quasi-monopoly sourcing situation, could easily provide a wide and tailor-made range of products (blocks, peak, off peak...) favourable to their own downstream subsidiaries, for instance especially during peak hours*"¹⁷⁸.
- (416) The new entity's incentives to foreclose are all the more likely in view of the specificities of the Hungarian gas retail market for the supply of gas to small industrial and commercial customers. As described above in recitals 55 to 59, the Hungarian gas sector is characterized by a hybrid model, with the coexistence of a regulated segment of the market and a liberalized market (or "open segment of the market"). Eligible customers have the right but not the obligation to switch suppliers to enter the open segment of the market. Customers who have switched to the open segment of the market are allowed to switch back to the regulated segment of the market (albeit this takes one year instead of 4 months).

¹⁷⁸ Response of EDF of 10 August 2005 to Question 27 of the request for information of 19 July 2005.

- (417) Customers that choose to stay under the regulated regime are supplied by their local RDC at regulated prices. In turn the RDC has an exclusive right and obligation to purchase gas from MOL WMT also at regulated prices. MOL WMT is the sole public utility wholesaler licensee. It has the obligation, by law, to cover the full natural gas demand for public utility purposes of the RDCs. To fulfil this obligation, the gas RDCs and MOL WMT have entered into long-term framework supply contracts, with duration from [...]* years. In contrast with the public utility contracts, the relationship between the eligible customers who switched suppliers and traders is largely subject to the principle of contractual freedom.
- (418) According to the parties, switching does not entail any significant costs or time investment on the side of the eligible customer. A customer that switches to the open segment of the market remains entitled to the cross-border, transmission, distribution and storage capacities allocated to him under the regulated regime. Therefore retail competition for eligible customers is based largely on price. This in turn implies that access to wholesale gas at competitive prices is the only way to attract customers from the regulated segment and increase market share. The integration with MOL WMT will give E.ON's downstream affiliates such competitive advantage over all other emerging and potential rivals on the market for the supply of gas to small industrial and commercial customers.
- (419) The Commission's analysis indicates that E.ON/MOL WMT's incentives to raise the costs of rivals on the market for the supply of gas to small industrial and commercial customers and its optimal foreclosure strategy is likely to evolve with the regulatory environment. One can distinguish two stages:
- i) Immediately after the transaction: as long as both retail prices to small industrial and commercial customers and wholesale gas prices are regulated, the new entity will have an incentive to raise the costs to rivals RDCs through non-price discrimination. Simultaneously, it is likely to increase the price of wholesale gas to independent traders to capture customers that switch to the open segment of the market.
 - ii) In July 2007: regulated prices are expected to be suppressed. At that point all eligible customers will have to switch to the open segment of the market. It is then likely that the new entity will have an incentive to foreclose all its downstream rivals on the market for the supply of gas to small industrial and commercial customers either by increasing the cost of gas or by reducing the quality of supply, whatever is optimal.

Current regulatory framework

- (420) Immediately after the transaction, the new entity will be in a position to increase the wholesale price to rival traders in the open segment of the market for the supply of supply to small industrial and commercial customers. This would tend to reduce their demand for wholesale gas but also it would reduce their ability to supply gas at competitive prices in the open segment of the market, thus losing market share to E.ON's trading affiliates. Given that the retail margin is high due to limited and

incipient competition, the lost profits upstream from reduced sales would likely be more than offset by increase profits in the open segment of the market¹⁷⁹.

- (421) In contrast, under the current framework, the merged entity cannot raise the costs of rival gas RDCs by unilaterally increasing the wholesale price, at least in the short-run¹⁸⁰. However, as the sole wholesale public utility supplier, MOL WMT has the ability to influence the profitability of RDCs. At the same time it increases wholesale gas prices to rival traders on the free segment of the market for the supply of gas to small industrial and commercial customers, the merged entity will have an incentive to raise the costs of rival gas RDCs by deteriorating the quality or flexibility of wholesale supply. It is also likely to deliberately reallocate costs associated with the supply to traders in the open segment of the market to the public utility segment¹⁸¹. In either case this would negatively affect the overall cost structure of RDCs, discouraging their expansion and limiting their ability to refinance their operations. This reduction in profitability would also affect the ability and incentive of rival RDCs to create and support trading arms to compete in the open segment of the market. As a result, competition would be significantly impeded to the detriment of consumer choice and the success of the ongoing liberalisation process.
- (422) Furthermore, a strategy of raising rivals' costs through non-price discrimination can be reflected in higher regulated prices.
- (423) Pursuant to Article 48(2) of the HGA the regulated price is based on the so-called cost-plus principle. The regulated purchase price that has to be paid to the public wholesaler contains both the gas fee and the fee for using the facilities (transport network and storage). The regulated price also includes the costs of the justified investments, as well as the profit necessary for long-term operation. The principle is that maximum prices shall be set so as to cover the costs of an efficient entrepreneur and the necessary profits for operation. Within the four-year revision cycle there are two built-in price correction elements: a regular price correction, proposed by the HEO with respect to annual changes e.g. in the import prices of natural gas, and an extraordinary price correction proposed in case events on the natural gas market make it obviously necessary.

¹⁷⁹ E.ON's strong presence in the downstream market for the supply of gas to small industrial and commercial customers through its control of DDGÁZ and KÖGÁZ and participation in FÖGÁZ would raise no concerns if these markets were intensely competitive. This is because the merged entity could appropriate all monopoly rents through its choice of the input price. Hence, in these circumstances it would not matter whether the upstream monopolist participates downstream. However, in the present case this retail market is oligopolistic and in the process of liberalisation. As a result, in a free market, the downstream equilibrium price will likely exceed marginal cost.

¹⁸⁰ But note that in the regulated segment the merger will not lead to the elimination of the double margin, even if that is possible in practice. Double marginalization occurs when downstream firms mark up over their marginal cost, which because of market power upstream exceeds the marginal cost of the upstream producer. Hence there is a mark-up on a mark-up or double marginalization.

¹⁸¹ According to economic analysis it is likely the merged entity will have an incentive to raise its rivals' costs all the way up to the point that revenues at regulated prices fail to cover costs thus forcing the rival RDC to push for an increase in the retail price, sell the company to the merged entity, or give up its own customers and focus on protecting its distribution profits.

- (424) Pursuant to Article 49 (3) of the HGA the HEO is obliged to undertake a price revision procedure on the basis of the request of any interested party, and shall publish the result thereof. The merged entity and independent RDCs have the right for such a price revision. Thus, if increased gas procurement costs lead to reduced margins, RDCs may choose to request a revision of the retail gas prices in order to maintain their profit margins¹⁸². Unfortunately, higher regulated retail prices would also have negative consequences on the liberalisation process since they would induce end-customers to switch to the open segment of the market, most likely to E.ON's trading arm given that its rival traders would pay a higher price for wholesale gas to MOL WMT and would not be competitive at the retail level. Not only would RDCs lose customers but may be unable to meet their TOP obligations (due to lower sales than expected), which would entail an additional cost.

Future regulatory framework

- (425) With respect to the medium term (after 2007), if customers were obliged to switch to the open segment of the market, this would only further strengthen the new entity's ability and incentive to foreclose access to wholesale gas. First, the new entity could increase prices in a fully open market unconstrained by the regulated price. Second, it could raise rivals' costs by increasing the wholesale gas price, which is likely to result in higher revenues than a reduction in the quality of supply – for an equivalent revenue loss from reduced demand for wholesale gas.
- (426) All market participants consulted by the Commission expect the hybrid model to disappear shortly after July 2007, when all residential customers will become eligible. Small industrial and commercial customers that have not yet switched to the open segment of the market will be forced to do so. According to current HEO plans, a USP appointed through an open competitive tender shall supply the small industrial and commercial customers¹⁸³ that have not concluded a supply contract with a specific supplier.
- (427) The market investigation has also revealed that most market players active in gas retail consider that the anti-competitive effects of input foreclosure are likely to be more immediate in such case. In particular, they have expressed the concern that *“post-transaction, E.ON's complete vertical integration on the gas supply chain will discourage new entries at the gas retail level, as it is likely to make it significantly harder for new operators to have access to competitive supplies and possibly storage service”*. Respondents also point to the mutually reinforcing effect of controlling access to wholesale gas and storage of gas, by arguing that, as a result of the merger *“E.ON would become de facto the exclusive supplier of its competitors in the Hungarian retail market. In addition through the control of storages, it could make significantly harder for third parties to supply fluctuating retail demand”*, and that *“there is significant space for E.ON as supplier (or storage service provider) to*

¹⁸² It is unlikely the regulator can monitor and oblige WMT to increase its efficiency with respect to supply to RDCs.

¹⁸³ The proposal for a new electricity market model foresees this for small industrial customers with fewer than 50 employees (see minutes of the meeting of 26 July 2005 with the HEO). It could be expected that the future proposal for a new gas market model will use the same reference.

apply to its competitors terms and conditions de facto different from those utilised by E.ON itself for its downstream activities in the Hungarian market”.

Factors relevant for raising rivals' costs strategies

- (428) In addition, several empirical factors relevant to determine the magnitude of the incentives to raise rivals' costs are present in this case.
- (429) First, there is little differentiation in the retail supply of gas. Despite small differences in calorific content, natural gas can be regarded as largely homogenous. When the downstream products are viewed by consumers as very similar, then the vertically integrated firm can readily supplant the sales its rivals lose due to discrimination with its own sales, thereby mitigating the effects of lost input sales.
- (430) Second, given contractual completeness, non-price discrimination may not only increase the costs of downstream rivals on the market for the supply of gas to small industrial and commercial customers but also reduce the costs of MOL WMT. By depressing quality and flexibility of supply and reducing customer service, MOL WMT avoids additional costs. When it is inexpensive for the upstream firm to non-price discriminate vis-à-vis its rivals then, other things equal, the upstream firm will have greater incentive to pursue non-price discrimination. Thus the merged entity benefits not only from the increased market share in the retail market for gas supply to small industrial and commercial customers but also from increased margins in the supply of wholesale gas to rival RDCs and traders.
- (431) Third, when the marginal cost of downstream gas supply is increasing, then it becomes progressively more costly for the integrated firm to replace its rivals' sales with its own. Hence the integrated firm may find it profitable to engage in some non-price discrimination, but not to raise its rivals' costs so high that they exit the market. An extreme form of this occurs when the integrated firm has a capacity constraint on its downstream production. In contrast, in this case, it appears that there exist economies of scale in the retail supply of gas to small industrial and commercial customers. This is due to fixed costs in developing a sales network able to induce consumers under the regulated segment to switch to the open segment of the market. Furthermore the integrated firm faces no capacity constraint in its ability to procure gas from upstream sources to supply.
- (432) Fourth, the incentive to raise rivals' costs also depends on the existence of a positive margin (price above cost) in the downstream market. If there is a high margin downstream the merged entity benefits from expanding market share at the expense of its foreclosed rivals. Profit margins are in general positively related to the intensity of competition. If competition is weak, margins are likely to be high. In this case, competition in the retail gas markets is limited. In part, this is because the open segment of the market is still incipient and RDCs have a strong incumbency position in their respective regions. It follows that, other things being equal, the new entity would have an incentive to raise its rivals' costs so as to obtain the profit margin from acquiring its rivals' customers on the market for the supply of gas to small industrial and commercial customers¹⁸⁴.

¹⁸⁴ The relative efficiency of downstream producers can also affect the incentive to raise rivals' costs. When the integrated firm has lower downstream production costs than its rivals, then the profit it can generate by

(433) It should be recognised that such discriminatory conduct is unlikely to be detected or penalised by the regulator. First, neither supply contracts nor the relevant regulation cover all scenarios and contingencies that may arise. As a result, MOL WMT enjoys certain discretion to worsen conditions of supply in ways that are difficult to verify by third parties. E.ON would enjoy the same discretion following the merger. Second, market players would not be likely to submit complaints to the regulator or competition authority in view of the dependence from the new entity for their gas supply. The likelihood of such input foreclosure strategy against downstream competitors would thus be increased, in the absence of sufficiently strong “regulatory” deterrence.

The parties’ reply to the SO

(434) In their reply to the SO, the parties generally argue that the Commission’s competition concerns do not go beyond the expression of “doubts” and, therefore, fail to meet the relevant standard of proof¹⁸⁵.

(435) However, the Commission’s competition concerns identified in its SO and in the present decision rely, as required by the case-law¹⁸⁶, on a prospective analysis of the events which, in its view, “*are the most likely*” to occur in the future, should the merger as notified take place. Contrary to the parties’ assertion, the Commission’s competition concerns set out in its SO are not based on mere speculations, but on a close examination of all the relevant evidence available as well as on a thorough economic analysis thereof, showing that the development envisaged is particularly “*plausible*”¹⁸⁷ and thus, likely to occur post-merger. In particular, the Commission examined whether, in view of both the ability and the likely incentives of the merged entity, the merger would be likely to result in an input foreclosure strategy and, thereby, significantly impede effective competition on the downstream gas markets in the foreseeable future. Consequently, the Commission did not limit itself to consider possible strategies, but also considered whether such outcome would be more likely than not to take place.

(436) As to the competition concerns identified by the Commission, the parties, in their reply to the SO, do not specifically dispute that effective competition would indeed be significantly impeded on the market for the supply of gas to small industrial and commercial customers, should an input foreclosure strategy take place as a result of the merger. Nor do they dispute the timing envisaged by the Commission as regards the likely effects of the merger on the market. However, they argue that, in any event, input foreclosure of downstream gas competitors would not be likely to occur post-merger.

(437) In the parties’ opinion, the new entity would not have the *ability* and the *incentive* to discriminate its downstream rivals because significant gas surpluses could be

selling retail gas downstream is greater than the profit (gross of input charges) its rivals can generate by selling that quantity of gas.

¹⁸⁵ Reply to the SO, I.2, pages 4-5.

¹⁸⁶ See Case 12/03 P, Commission / Tetra Laval, paragraphs 42-43.

¹⁸⁷ See Case 12/03 P, Commission / Tetra Laval, paragraph 44.

diverted to the Baumgarten entry point for onward supply into Hungary, following the removal of price regulation¹⁸⁸.

- (438) However, this argument ignores that the Commission's competition concern is essentially based on the fact that, should gas supplies be available in sufficient quantities at the Western entry point, such supplies would not be made, in any event, at competitive prices. In that regard, the parties do not dispute that a substantial price difference exists with the cost of gas imported by MOL WMT, which purchases most of its gas from Gazprom and other operators at the Eastern entry point, and that, as a consequence, foreclosed competitors would not be in a position to rely on competitive gas should their input costs increase post-merger.
- (439) The parties also dispute the likelihood of foreclosure by E.ON of its downstream competitors, arguing that the Commission's analysis is too pessimistic as it ignores the high level and effectiveness of Hungarian energy regulation and the sophistication of other market participants.
- (440) While the Commission does not dispute the existence of regulations, it should be pointed out that the regulation mostly concerns the activities of transmission and storage rather than gas supply (with the exception of the hybrid model until July 2007). In addition, as pointed out by the HEO itself, regulations may not consider and address all possible scenarios of discrimination:

*“There is an ongoing polishing of the existing rules in the Grid Code, which is modified every year to give more chance to the free market. There are no stable rules in the market.”*¹⁸⁹

- (441) The parties also submit that the Commission's analysis relies on a purely speculative analysis of which type of “*abusive behaviour*” the merged entity might adopt in the future, which fails to satisfy a test of “high probability”¹⁹⁰. In that respect, the parties essentially argue that the merged entity would have no *incentive* to adopt an abusive behaviour because, in light of the relative simplicity of gas market contracts, such a conduct would be detected by competitors and by the regulator, and would be penalised accordingly following complaints¹⁹¹. In addition, according to the parties, the various discrimination scenarios have not been identified by market respondents and are not typical of E.ON's conduct (or of other energy companies)¹⁹².
- (442) The parties' suggestion that the Commission's competition concerns rely on a list of “*abusive behaviour*” is based on a wrong reading of the SO. Contrary to what is argued by the parties, the Commission did not take a position as to whether the various strategies likely to be adopted by the merged entity as a result of the merger

¹⁹⁰ Reply to the SO, II.1.2 and II.1.3, pages 6-8.

¹⁹¹ Reply to the SO, II.1.3, II.1.4 and II.1.5, pages 9-10. and Annex 1 thereto

¹⁹² Reply to the SO, II.1.2 and II.1.3, pages 7-9.

would necessarily fall within the scope of Article 82 EC and would be penalised as such. As recently held by the Court of Justice, it is not necessary for the Commission, when assessing the likely effects of a merger, to determine whether a specific conduct likely to be adopted by the merged entity would constitute an infringement of Article 82 EC and would be sanctioned as such in the relevant national order. Indeed, an exhaustive and detailed examination of the rules of the various legal orders which might be applicable and of the enforcement policy practised in them would call for a high probability of the occurrence of the acts envisaged as capable of giving rise to objections on the ground that they are part of anti-competitive conduct.¹⁹³ However, it would run counter to the Regulation's purpose of prevention to require the Commission to examine, for each proposed merger, the extent to which the incentives to adopt anti-competitive conduct would be reduced, or even eliminated, as a result of the unlawfulness of the conduct in question, the likelihood of its detection, the action taken by the competent authorities, both at Community and national level, and the financial penalties which could ensue¹⁹⁴. Moreover, as stated by the Court of Justice, "*at the stage of assessing a proposed merger, an assessment intended to establish whether an infringement of Article 82 EC is likely and to ascertain that it will be penalised in several legal orders would be too speculative and would not allow the Commission to base its assessment on all of the relevant facts with a view to establishing whether they support an economic scenario in which a development such as leveraging will occur*"¹⁹⁵. In that context, the Court of First Instance recently concluded, citing paragraph 74 of the Court of Justice's judgment in *Tetra Laval*, that "*where the Commission, without undertaking a specific and detailed investigation into the matter, can identify the unlawful nature of the conduct in question, in the light of Article 82 EC or of other provisions of Community law which it is competent to enforce, it is its responsibility to make a finding to that effect and take account of it in its assessment of the likelihood that the merged entity will engage in such conduct*".¹⁹⁶

- (443) In the present case, it would be all the more difficult to consider *ab initio* that the various foreclosure strategies likely to be adopted post-merger would necessarily be considered by the national authorities as discriminatory practices within the meaning of Article 82 EC given that, contrary to what the parties claim, gas supply contracts with traders are generally complex and contain specific clauses adapted to the needs of each negotiating party.
- (444) Even if such discriminatory practices were ultimately considered as an abuse of a dominant position, it is nonetheless highly likely that, in the future market context, the merged entity would have strong incentives to act in such a manner. Indeed, there is generally no transparency as regards the price formulae applicable in gas supply contracts since such information is crucial for the competitive operation of

¹⁹³ Case C-12/03 P, *Commission v Tetra Laval* [2005] ECR I-987, paragraph 76.

¹⁹⁴ Case C-12/03 P, *Commission v Tetra Laval* [2005] ECR I-987, paragraph 75.

¹⁹⁵ See Case 12/03 P, *Commission / Tetra Laval*, para.77.

¹⁹⁶ Case T-210/01, *General Electric v Commission*, judgment of 14 December 2005, not yet recorded, paragraph 74.

traders. For these reasons, it is very unlikely that a rival trader would be in a position, at any given time, to effectively compare the terms of its contract with those applicable in E.ON's affiliates' contracts.

(445) This is also true as regards the energy regulator, since it may not detect such differences in due time. In that regard, the HEO itself acknowledged, with respect to possible discriminative practices in access to storage (which is even more regulated than the market for the supply of gas to RDCs and traders) that they are “*very hard to prove using administrative methods (as it is indicated from time to time, the market player which is at a disadvantage fears for its future position on the market, and will rather not submit a complaint at the regulatory or competition authority)*”¹⁹⁷.

(446) As regards gas supply contracts, although the HEO has indicated that it has the right to control and to force market players to act without discrimination¹⁹⁸, it has also indicated several times, concerning different issues, that it did not have good information on the commercial contracts concluded by operators, nor could it request access to this information:

*“The HEO is not familiar with the free market prices, as few players provide information to the HEO on the prices on the free market (and only average prices).”*¹⁹⁹

*“In the Hungarian regulatory framework, confirmed customer demand is required to book capacity. Every year, every market player is required to show the demand of its customers for the next ten years (the demand relating to the 9 years after is based on their hopes, not on facts!). The problem is that it is not clear who is responsible for checking this, as the law does not say how it is checked. The HEO takes the view that this should be checked by the TSO, but the TSO claims that they have no tools to do so, because the agreements signed between third parties are confidential. (...) The HEO can check the licensees and their books, but not the commercial contracts.”*²⁰⁰

*“The HEO does not know which companies were offered such a long-term contract and which have signed a long-term contract and for which volumes of gas.”*²⁰¹

¹⁹⁹ Minutes of the meeting of 26 July 2005 with the HEO, p. 6 (comments on slide 27 of the Presentation entitled “Introduction of the Hungarian Natural Gas Market”).

²⁰⁰ Minutes of the meeting of 26 July 2005 with the HEO, p. 7 (comments on slide 18 of the Presentation entitled “Hungarian Natural Gas Market: Transmission and Distribution”).

²⁰¹ Minutes of the meeting of 26 July 2005 with the HEO, p. 10 (comments on slide 20 of the Presentation entitled “Hungarian Natural Gas Market: Storage and miscellaneous questions”).

- (447) As to the argument that the various ways in which input foreclosure strategies may take place have not been precisely identified by market respondents, it ignores the fact that, nevertheless, market players have clearly identified the risk of input foreclosure as a likely effect of the merger. Similarly, the argument that discriminatory practices are not typical of E.ON's conduct in other jurisdictions does not demonstrate that such outcome is unlikely in Hungary as it relies on the wrong assumption that comparable market conditions exist in other jurisdictions and/or that such practices could have been easily detected and penalised under Article 82 of the Treaty.
- (448) Last, the parties argue that it is pure speculation for the Commission to consider that market players would not be likely to submit complaints in view of their dependence on the new entity for their gas supply other market participants. According to the parties, this did not prevent Hungarian energy companies from expressing their opinion freely on the merger in the course of the Commission's market investigation. The parties disregard the fact that many respondents requested a confidential treatment of their responses, precisely to avoid possible future retaliation by the new entity on which they depend for their operations in the Hungarian energy markets.

Conclusion

- (449) On the basis of the evidence available and the analysis developed above, the Commission considers that, as a result of the merger, the new entity is likely to have the ability and the incentive to foreclose access to gas resources to its downstream competitors on the market for the supply of gas to small industrial and commercial customers, starting immediately after the transaction.
- (450) In view of the new entity's dominant position on the upstream markets for the wholesale supply, and the storage, of gas in Hungary and because of its presence in the downstream gas market for the supply of gas to small industrial and commercial customers (owing to its controlled RDCs) the merged entity will have, already in the current regulatory scenario and at the current stage of market liberalisation, the ability and the incentive to foreclose access to gas to a) its competitors in the current free market, thereby reducing the scope for the development of a competitive free market; and b) its competitors in the regulated market by engaging in non-price discrimination with a view to raising their input costs. As a result, actual competitors are likely to be marginalised, thereby allowing the new entity to gain increased market power on the downstream gas market for the supply of gas to small industrial and commercial customers.
- (451) Furthermore, this vertical effect of the transaction (i.e. input foreclosure) will, in all likelihood, discourage new entries in the market as potential entrants will not expect to be in a position to contract gas supplies with the new entity under terms and conditions similar to those applicable to E.ON's affiliates.
- (452) Furthermore, the Commission considers that the above-described foreclosure strategy will be all the more effective and easier to implement in the framework of an increasingly liberalised market, whose next developments are expected to occur in the near future (as from 1 July 2007).
- (453) For all these reasons, the Commission is of the view that, by allowing the merged entity to raise its rivals' costs and deter new entry on the retail market for the supply

of gas to small industrial and commercial customers, the merger as notified will significantly impede effective competition in a substantial part of the common market within the meaning of Article 2 of the Merger Regulation.

b. The new entity will have the ability and incentive to foreclose its competitors in gas retail on the market for the supply of gas to residential customers

(454) Currently, the market positions of the various retailers (RDCs and traders) on the Hungarian market for the supply of gas to residential customers are as follows:

Suppliers	Supply of gas to residential customers in 2004	
	In million m ³	In %
KÖGÁZ	[0-500]*	[5-10%]
DDGÁZ	[0-500]*	[5-10%]
Total E.ON	[0-500]*	[15-20%]
FŐGÁZ	[500-1000]	[20-30%]
ÉGÁZ	[0-500]	[0-10%]
DÉGÁZ	[500-1000]	[10-20%]
TIGÁZ	[1000-2000]	[30-40%]
MOL WMT	0	0%
Total Market	[4000-5000]	100%

(455) As for the supply of gas to small industrial and commercial customers, the fundamental change brought about by the transaction is that E.ON, unlike MOL, is active on the market for the supply of gas to residential customers through its solely controlled affiliates, KÖGÁZ and DDGÁZ, and through FŐGÁZ, in which it holds a minority shareholding. Thus, whereas prior to the transaction MOL WMT had no incentives to act to the detriment of its customers as it was not competing with them downstream, the merger is likely to result in the new entity now having the ability *and* the incentive to foreclose competitors on the downstream market for the supply of gas to residential customers, so as to significantly impede competition thereon.

(456) In that regard, the analysis developed in section a) above (recitals 401 to 453) with regard to the likely effects of the merger on the market for the supply of gas to small industrial and commercial customers applies to the effects of the merger on the market for the supply of gas to residential customers. However, with respect to the timing of such effects, the Commission considers that a distinction should be drawn due to the different regulatory situations of both markets.

(457) Indeed, by contrast with the market for the supply of gas to small industrial and commercial customers, the market for the supply of gas to residential customers is not yet open to competition as, pursuant to Directive 2003/55/EC, residential customers will only become eligible as of July 2007. For the time being, residential customers are supplied within a public utility contract by their local RDC, which in turn is supplied by the public utility wholesaler, MOL WMT.

- (458) When the market is open to competition, i.e. at the latest in July 2007, Hungarian players expect that the current system of public utility supply will be replaced with a Universal Service Provider (“USP”) concept for residential customers which have not concluded a supply contract with a specific supplier. Such USP shall be a gas trader licensee appointed through a competitive tender and shall be entrusted with the supply of residential customers throughout Hungary at regulated prices.
- (459) Although the parties have not raised any specific argument with respect to the impact of the regulatory situation on the competitive assessment²⁰², the Commission has carefully considered whether the absence of competition on the market for residential customers on the expected date of the decision could, by itself, dispel the concern that the merger will significantly impede effective competition within the meaning of Article 2(3) of the Merger Regulation.
- (460) It follows from the case-law that, where markets are due to be open to competition in the future by virtue of Community legislation, the Commission must not limit itself to assessing only the future effects of the concentration as from the date of their opening to competition, but should also take into account the immediate effects of the concentration on these markets²⁰³. Indeed, according to the Court of First Instance, although the Commission “*may, where appropriate, take into account the effects of a concentration in the near future...or indeed base its prohibition decision of a concentration on such future effects...that does not allow it to refrain from analysing the immediate effects of such a transaction if they exist and from taking them into account in its overall assessment of the transaction*”²⁰⁴. On the other hand, it would run counter to the “*Regulation’s purpose of prevention*”²⁰⁵ and to the prospective analysis of the kind necessary in merger control²⁰⁶ to focus exclusively on such immediate effects (if they exist) as it would lead the Commission to ignore that a merger may have the effect of pre-empting the introduction of effective competition - and thus significantly impede it - in markets not yet liberalized, contrary to the intention of the Community legislature.
- (461) In the present case, since residential customers will become eligible in July 2007, i.e. only 18 months after the adoption of the present decision, the Commission considers that the main anticompetitive effects resulting from the merger will occur as from that date. Indeed, in view of the new entity’s dominant position on the upstream markets for the wholesale supply, and the storage, of gas in Hungary and because of its presence in the downstream market for the supply of gas to residential customers (owing to its controlled RDCs), the merged entity will have – for the same

²⁰² It is not argued, in particular, that the Commission is not entitled to assess the effects of the merger on that market, due to be opened to competition shortly.

²⁰³ Case T-87/05, *EDP – Energias de Portugal / Commission*, [2005] ECR II-0000 para. 123.

²⁰⁴ Case T-87/05, *EDP – Energias de Portugal / Commission*, [2005] ECR II-0000 para. 124.

²⁰⁵ Case 12/03 P, *P Commission v Tetra Laval* [2005] ECR I-0000, para. 75.

²⁰⁶ According to the Court of Justice, such a prospective analysis entails “*a prediction of events which are more or less likely to occur in future if a decision prohibiting the planned concentration or laying down the conditions for it is not adopted*” (Case 12/03 P, *P Commission v Tetra Laval* [2005] ECR I-0000, paragraph 42).

reasons as for the market for the supply of gas to small industrial and commercial customers - the ability and the incentive to foreclose access to gas to its actual and potential competitors in the market for the supply of gas to residential customers, thereby a) reducing the scope for the development of a competitive free segment of the market for the supply of gas to residential customers (where residential customers would conclude a gas supply contract with the supplier of their choice); and/or b) its actual and potential competitors in the regulated segment of the market for the supply of gas to residential customers (USPs) which are in competition with E.ON's affiliates to be appointed as USPs in a competitive tender while having to source their gas from the new entity (at prices and conditions freely negotiated). As a result of this likely behaviour, actual competitors are likely to be marginalised, thereby allowing the new entity to gain increased market power on the downstream gas market for the supply of gas to residential customers when they become eligible in July 2007.

- (462) Furthermore, the Commission considers that, in addition to these future anticompetitive effects, the merger is also likely to produce immediate effects. First, given that the merger is likely to immediately and significantly impede effective competition on the neighbouring and closely related market for the supply of gas to small industrial and commercial customers, existing rival retailers will be weakened. Since those retailers are the same as those likely to compete for residential customers when they become eligible, the merger will therefore produce an immediate spill-over effect. Secondly, the likely vertical effects of the transaction (i.e. input foreclosure) is likely to already discourage potential new entrants to prepare their entry on the market for the supply of gas to residential customers as they will not expect to be in a position to contract gas supplies with the new entity under terms and conditions similar to those applicable to E.ON's affiliates. In particular, it is worth recalling that gas supply contracts for the gas sourcing of the suppliers are often concluded well in advance and that market entry has to be planned well before the actual opening of the market. From that perspective, the merger will thus also produce immediate effects by further deterring possible entries on the market.
- (463) Finally, it should be noted that the Commission's competitive assessment would be the same, should the markets for gas supply to residential customers and for gas supply to small industrial and commercial customers become one same market immediately after July 2007. The only change in July 2007 in that case would then be the size of the market of gas supply to small customers (residential and non-residential), which would increase from 2-3 bcm to 6-8 bcm (when residential customers are added).

Conclusion

- (464) On the basis of the evidence available and the analysis developed above, the Commission considers that, as a result of the merger, the new entity will have the ability and the incentive to foreclose access to gas resources to its downstream competitors on the market for the supply of gas to residential customers.
- (465) In their reply to the SO, the parties raise the same arguments with regard to both the market for the supply of gas to small industrial and commercial customers and the market for the supply of gas to residential customers, without putting forward considerations specific to the latter market. Consequently, it is sufficient to refer, in

that respect, to the Commission's analysis already set out in the previous section relating to the market for the supply of gas to small industrial and commercial customers.

- (466) For all these reasons, the Commission is of the view that, by allowing the merged entity to raise its rivals' costs and deter new entry on the retail market for the supply of gas to residential customers, the merger as notified will significantly impede effective competition in a substantial part of the common market within the meaning of Article 2 of the Merger Regulation.

c. The new entity will acquire a dominant position in the supply of gas to large industrial customers

- (467) On the market for the supply of gas to large industrial customers, MOL WMT directly supplies natural gas to approximately [10-20]* industrial customers connected to the high pressure pipeline and, therefore, competes - to some extent - with the RDCs which also supply some large industrial customers through the distribution network. The customers supplied by MOL WMT (both as public utility wholesaler on the regulated segment of the market and as a trader on the open segment of the market) accounted for approximately [0-2]* bcm in 2004, that is [30-40%] of the market. The table below summarizes the market shares of the various suppliers of large industrial customers (both on the regulated segment of the market through RDCs and MOL WMT public utility wholesaler and on the open segment of the market through MOL WMT and the only new entrant so far, EMFESZ).

Suppliers	Supply of gas to large industrial customers in 2004	
	In million m ³	In %
KÖGÁZ	[0-500]*	[5-10%]
DDGÁZ	[0-500]*	[5-10%]
Total E.ON	[0-500]*	[10-15%]
MOL WMT	[500-1000]*	[30-35%]
FÖGÁZ	[0-500]	[10-20%]
ÉGÁZ	[0-500]	[10-20%]
DÉGÁZ	[0-500]	[0-10%]
TIGÁZ	[500-1000]	[10-20%]
EMFESZ	[0-500]	[0-10%]
New entity	[1000-2000]*	[45-50%]
Total Market	[3000-4000]	100%

- (468) It should be underlined that, up to now, MOL WMT and RDCs have only been indirect competitors on that market. On the regulated segment of the market, MOL WMT can only supply customers directly connected to the transmission network that are listed in its license as public utility wholesaler, whereas customers connected to the distribution network can only purchase gas from their local RDCs. In addition, despite being both supplying large industrial customers, MOL WMT and RDCs are in a vertical relationship as RDCs are obliged to source their gas from MOL WMT on the regulated segment of the market.
- (469) Up to now, few customers have been able to obtain better offers on the open segment of the market from traders such as EMFESZ because regulated prices have so far remained quite low.

- (470) As of July 2007, the hybrid model and regulated prices will disappear for large industrial customers. It is likely that, absent the merger, MOL WMT would have been able, in its position of gas trader licensee, to gain more customers connected to a distribution network by proposing to supply them directly. Therefore, the Commission acknowledges that, irrespective of the merger, MOL WMT would already have the ability and the incentive to increase its position on the market for gas supply to large industrial customers.
- (471) Nevertheless, the change brought about by the merger results from the addition of E.ON's significant customer portfolio of its controlled RDCs (KÖGÁZ, DDGÁZ) and, arguably, of FŐGÁZ, about which it has privileged information. This overlap will grant an additional competitive advantage to the merged entity by enabling it, as opposed to its current competitor EMFESZ and to potential entrants, to immediately gain access to a significant customer base.
- (472) In addition, the Commission believes that, for the same reasons as in section a) above (recitals 401 to 453), the new entity will have the ability and incentive to foreclose access to its competitors downstream in the market for the supply of gas to large industrial customers in Hungary. Moreover, such foreclosure strategy would likely be reinforced as MOL Transmission would have an incentive to discriminate vis-à-vis MOL WMT's rivals for the supply of gas to large industrial customers, with a view to increase MOL WMT's profits.
- (473) In their reply to the SO²⁰⁷, the parties argue that the Commission has not sufficiently developed its reasoning as regards the creation of a dominant position in this market and "*has not engaged into an analysis of the countervailing competitive forces emanating from the other five significant*" competitors.
- (474) It appears that four out of the "*other five significant competitors*" referred to by the parties are RDCs not connected to E.ON. However, as explained in the SO, on the market for the supply of gas to large industrial customers, MOL WMT competes with RDCs, whilst, at the same time, the latter are obliged to source their gas from MOL WMT for their supply activities on the regulated segment of the market, and do not have any alternatives to sourcing from MOL WMT on the liberalised segment of the market. The parties have not even attempted to explain how RDCs would be in a position to exert a "significant" competitive constraint on the new entity while, at the same time, sourcing their gas from the latter, and have limited their rebuttal to alleging that the Commission has not developed its analysis in full. Consequently, in addition to the significant horizontal effects brought about by the merger, the new entity will have the ability and the incentive to foreclose these competitors on the market for gas supply to large industrial customers in the same manner as in other retail gas markets. Hence, the foreclosure scenario described in detail in the previous sections applies, mutatis mutandis, to this market as well.
- (475) As to the parties' argument that the Commission has not made up its mind on whether the competition concerns on this market would be of horizontal or vertical nature, it is worth recalling, as indicated in the SO, that the concerns arising on this market are due mainly to the horizontal effects of the merger, which result not only from the overlap leading to a combined market share indicative of dominance ([40-

²⁰⁷ Page 11

50%]* market share resulting from the combination of the market shares of MOL WMT and of E.ON's RDCs KÖGÁZ and DDGÁZ), but also from the addition of the significant customer portfolio of E.ON's RDCs, and arguably, of FÖGÁZ, about which the new entity will have privileged information.

(476) For these reasons, the Commission is of the view that the merger will significantly impede effective competition in a substantial part of the common market within the meaning of Article 2 of the Merger Regulation, through the creation of a dominant position on the market for gas supply to large industrial customers.

(ii) Storage of gas

(477) Any gas supplier needs to have access to storage facilities to be active on the gas retail markets, essentially in order to manage the seasonal fluctuations in the demand of its customers. Depending on the type and the number of customers, a gas supplier has to deal with daily, weekly and seasonal fluctuations so that access to efficient storage facilities at good economic conditions is an absolutely necessary condition for any supplier.

(478) It is interesting to note that suppliers with a very large and diversified customer base may need to reserve lower storage capacities as the overall variation of demand of their customers is lower due to synchronicity (when using storage for balancing) than suppliers with a limited number of customers with a fluctuating demand. This provides large gas suppliers and other gas suppliers whose customers have a stable demand with a competitive advantage over smaller competitors.

a. MOL Storage holds a dominant position in the storage of gas in Hungary

(479) MOL Storage is the only company owning gas storage facilities in Hungary and therefore the only one able to offer gas storage services.

(480) MOL Storage will be acquired by E.ON as part of the transaction. The Share Purchase Agreement also foresees that MOL will retain a 25%+1 shareholding in MOL Storage. A structural link between MOL and MOL Storage will thus be maintained. An additional commercial link arises from the Supply Agreement concluded between MOL (MOL E&P) and MOL WMT for the sale of domestic gas.

(481) All Hungarian gas storage capacities are currently fully booked, essentially by MOL WMT as public utility supplier ([2-4]* bcm or [40-50]* million m³/day, accounting for [90-100%]* of storage capacities). The rest of the storage capacity is booked by EMFESZ for [0-1]* bcm and by MOL WMT as trader (MOL's trading licensee on the open segment of the market) for [0-1]* bcm.

(482) It is worth noting that, similarly as for the access to the transmission network, as the public utility wholesaler and supplier, MOL WMT has privileged access to storage facilities (for residential and "communal" customers), as specified in Article 30(2) of the HGA. Like any other operator, MOL WMT is entitled to book capacity only on the basis of confirmed customer demand.

(483) The remaining capacity can be allocated to operators on the open segment of the market (i.e. serving customers in the open segment of the market). Pursuant to the

HGA, access to storage in the open segment of the market is negotiated and not regulated (i.e. tariffs are not set by the regulator but through commercial negotiations with the storage operator). It is however foreseen that the system will change and become fully regulated for all operators (regardless of the status of their customers), pursuant to the conditions attached to the HEO resolution approving the E.ON/MOL transaction.

- (484) As mentioned on 27 June 2005, the HEO adopted a resolution approving the E.ON/MOL transaction, subject to legally binding conditions.
- (485) Some of these conditions are related to Storage, most notably Condition 5 (Implementation of a gas storage development scheme for 2005-2009 approved by the HEO); and Condition 6 (MOL Storage commit to apply a regulated access for all system users, i.e. also in the open segment of the market, until real competitive market situation between natural gas storages takes place, and to comply with the GGPSSO).

b. The new entity will have the ability and incentive to discriminate against its competitors in granting access to storage

Discriminatory behaviour in granting access to storage

- (486) The Commission believes that, as the result of the merger, E.ON will have the ability and the incentive to adopt discriminatory behaviour with respect to access to storage with a view to reinforce the gas input foreclosure strategy as described above to the detriment of E.ON's competitors downstream.
- (487) In their reply to the SO the parties argue that, as regards storage, "*MOL currently has the same power and incentive to discriminate*" and claim that "*the change in ownership in MOL Storage will not result in the emergence of a new discriminatory element or increase the chance or willingness for such discrimination*"²⁰⁸.
- (488) The Commission disagrees with the parties' argument that the incentive to discriminate will remain unchanged further to the transaction. As a matter of fact, the vertical integration of E.ON downstream (notably through its majority and minority participation in three gas RDCs) represents the fundamental difference vis-à-vis the situation pre-transaction, as MOL is not active in the downstream gas markets, and will create the incentive for the new entity to exploit its dominant position in storage to reinforce its strategy of foreclosure of competing operators in the gas downstream markets, by raising (directly or indirectly) the cost of storage services for those competitors.
- (489) While the incentive to discriminate would change with the transaction, the ability to discriminate would not in spite of the conditions attached to the HEO resolution. The parties have stressed in particular the importance of condition 6 of the resolution, by emphasising that MOL Storage will be forced to apply the regulated segment of the market conditions also to all operators in the open segment of the market, thereby eliminating the possibility of discriminating against E.ON's competitors with the aim of raising rivals' costs.

²⁰⁸ Reply to the SO, p. 18.

- (490) However, the Commission understands that MOL Storage will have to submit a proposal for the new “fully” regulated regime by 31 May 2006. The HEO would then review and possibly approve MOL Storage’s proposal. This approval process may take some time, as the HEO may request certain amendments to the proposal.
- (491) This means that the fully regulated regime may enter into force well into the second semester 2006 if not later. Whilst the Commission acknowledges that the coming into force of a fully regulated storage regime may at least alleviate concerns regarding the discriminatory behaviour on the part of MOL Storage against E.ON’ competitors, and that therefore the full and timely implementation of the conditions attached to the resolution of the HEO may reduce the ability to discriminate, it has to be stressed that during the period running up to the final approval by the HEO of the new fully regulated regime, MOL Storage would still have margin for manoeuvre for applying discriminatory pricing terms and conditions. In a scenario of growing liberalised market (as also stressed by the parties), the scope and the incentive for potential discrimination should be taken into account, as such discriminatory behaviour could be particularly harmful at the beginning of the liberalisation process.
- (492) The parties argue in their reply to the SO that the Commission has not duly taken into account that “*under the approval decision of the HEO, the present transaction can only be consummated if E.ON/ERI submitted an irrevocable guarantee in respect of the fulfilment of the conditions*”.
- (493) The Commission however stresses that the new entity’s obligation is, in this respect, limited to elaborating “*the conditions of regulated storage access in its General Terms of Business*” by 31 May 2006 and applying for the HEO’s approval. It is only following the HEO’s approval – which may take some time – that “*MOL Storage obeys the amended provisions thereof in the c[o]urse of applying regulated storage access*”.
- (494) Moreover, the parties also argue that the Commission “*should not be worried about the interim period of the first half year of 2006*” as “*this represents the second half of the current gas year for which all agreements relevant to storage access have already been concluded and those agreement cannot be changed post closing*”.
- (495) The Commission considers that this argument fails to acknowledge the possibility that other third parties may need access to storage services during the second half of 2006, for which new contracts would have to be negotiated during the first half of 2006. The storage injection season does not correspond to the gas year, as it runs from 1 April until 30 September, and the withdrawal season starts from mid-October after a few weeks of maintenance. Furthermore, the parties may also engage in non-price discriminatory behaviour even in the framework of existing contracts, as further explained below. Finally, the parties put forward their argument as regards the first semester of 2006, while not contesting the Commission’s assessment that “*the fully regulated regime may enter into force well into the second semester 2006 if not later*.”
- (496) Moreover, since the regulated prices are established by the HEO on the basis of inputs, estimates and information provided by the operator of the storage facilities, E.ON may have the ability and the incentive to cross-subsidise its activities in the gas downstream open segment of the markets through its near-monopolistic

activities (in gas storage) by providing information according to which the HEO would set regulated prices above real costs.

- (497) The parties argue in their reply to the SO (Annex 2, page 3) that the HEO is currently reviewing the “*storage costs*” with the objective of “*calculating the new regulated storage tariffs, which will be in effect from 1 January 2006 for four years*”. This review should be finalised before the expected completion of the transaction. The parties conclude, on this basis, that “*E.ON can have no effect on the newly accepted cost regime for the period 2006-2009*”.
- (498) However, the parties fail to mention that price reviews are possible, at the request of the storage operator. The HEO foresees a specific procedure for such reviews, to be concluded with HEO resolutions. In this light, the argument of the parties appears to be moot.
- (499) Secondly, MOL WMT may still exploit its priority position for the allocation of storage capacity by over-nominating its capacity needs of storage. This appears to be a concrete possibility, in spite of the requirement that capacity only be booked on the basis of confirmed consumption/customer demand. As a matter of fact a third party indicated that the system’s “*technical capacity*” is 20-30% higher than “*regulatory capacity*”²⁰⁹, meaning that most if not all operators tend to book more capacity than actually needed. This has the effect of congesting the system and the objective/effect of raising barriers to entry for new suppliers.
- (500) By overbooking its priority storage capacity, MOL WMT would increase the system’s congestion. As a result, the “*lower priority*” capacity would become scarcer, thus raising, in the period up to the full implementation of the HEO resolution, the non-regulated price of storage services and creating an additional barrier to entry on the open segment of the market.
- (501) The parties have argued²¹⁰ that it would not be “*in the interest of the owner of MOL WMT to overbook storage capacities as this would be costly*”. However, the Commission considers that the cost of overbooking incurred by MOL WMT may well be (more than) compensated by the extra revenues accruing to MOL Storage due to the higher price of storage services, now become scarcer due to their reduced availability, and by the revenues accruing to MOL WMT through preventing and/or raising barriers to the entry of competitors.
- (502) Thirdly, as already indicated, the HGA provides for Third Party Access to storage, whose principles are the same as for the booking of transmission capacities. Once a new supplier has acquired an eligible customer, the Already Allocated Capacity required to supply this customer should be automatically transferred to the new supplier.
- (503) However, the customer-based capacity allocation regime may leave some margin for discriminatory behaviour. As a matter of fact, MOL Storage may engage in a whole

²⁰⁹ Minutes of meeting with EMFESZ of 28 July 2005: “Better control of compliance with the rules should be secured, e.g. regarding the customer-based capacity allocation regime”.

²¹⁰ Reply to the SO, annex 2, pp. 3-4.

range of actions intended to increase the costs to E.ON's downstream competitors, such as designing storage services that are more suited to the needs of an incumbent than those of new entrants (as regards injection and withdrawal rates and volumes of gas stored), delays in allocation of storage capacity, reductions in the quality of service, mistakes in processing orders, lack of flexibility and so on, thereby significantly increasing the operational costs of competitors of the merged entity in the downstream markets.

- (504) Finally, even in the scenario of fully regulated prices for storage services, MOL Storage may have the ability and the incentive to discriminate against E.ON competitors by means of more onerous/less flexible contractual terms as compared to those negotiated with intra-group companies (e.g. the trading branch of MOL WMT active on the open segment of the market).
- (505) Moreover, it may be argued, as an aggravating factor, that any discriminatory behaviour may also prove difficult to detect considering that market players would not be likely to submit complaints to the regulator or competition authority in view of the monopolistic position of E.ON in the market for storage. In addition, as MOL WMT will remain by far the biggest client of MOL Storage, E.ON may argue that contractual terms and conditions would differ for "objective" reasons. The likelihood of the anticompetitive behaviour aimed at reinforcing the gas foreclosing strategy vis-à-vis downstream competitors would thus be increased, in the absence of sufficiently strong "regulatory" deterrence.
- (506) In their reply to the SO²¹¹ the parties argue that *"there is no reason to believe that in the future, the customers of MOL Storage would be deterred from submitting complaints against the business conduct of MOL Storage"*.
- (507) Nonetheless, the Commission stresses that even the HEO, the body which is responsible for overseeing the fair, transparent and non discriminatory functioning of the gas sector in Hungary, has stated that *"[p]ossible discriminative rules applied regarding storage access is a behaviour that is very hard to prove using administrative methods. (...) The market player which is at a disadvantage fears for its future position on the market, and will rather not submit a complaint at the regulatory or competition authority"*²¹². In this light, the argument of the parties appears to be moot.

The development of storage capacity and the possibility of increased competition

- (508) Finally, E.ON will be able to control the development of new storage capacities in Hungary. This is due to the combination of two elements: a) the call option foreseen in paragraph 10.10 of the Share Purchase Agreement for MOL Storage to purchase depleted fields from MOL E&P; and b) the 25%+1 shareholding to be retained by MOL into MOL Storage.

²¹¹ Page 18

²¹² Reply of the HEO to the Hungarian Competition Authority's questions regarding the E.ON/MOL transaction, 11 April 2005, page 4.

- (509) There are around 50 empty underground reservoirs in Hungary, owned by MOL E&P, which have the potential to be converted into storage facilities. The parties have stated that [...] of these 50 depleted fields can be converted into storage facilities within a 3 to 10 years period. The capacity of these potential storage facilities is between 100 million m³ and 3 bcm each.
- (510) Out of these ten “best” depleted fields, three may be converted within a period of 2 years for a total capacity of 350 million m³²¹³. Another two may be converted within 3-4 years for a total capacity of 850 million m³.
- (511) Paragraph [...] of the Storage Shareholder Agreement (“SSA”) between MOL and E.ON grants the [...]. The call option has a validity of [...] years. Schedule 7 attached to the SSA foresees that [...].
- (512) As mentioned, the call option grants MOL Storage the right to purchase depleted fields for a total capacity of up to 1 bcm. As a result, by exercising the call option E.ON will be in a position to prevent new entry into the storage market for a number of years, as the most readily available fields (i.e. convertible in a period of [0-5]* years) amount to a capacity of only [1-2]* bcm, thus leaving no scope for entry for at least [0-5]* years and only marginal scope, if any, for [2-5]* years.
- (513) Furthermore, in view of the minority shareholding of MOL into MOL Storage and the commercial relationship between MOL (MOL E&P) and the new entity as regards the sale of domestic gas, MOL will have an economic interest to discourage potential new entrants into the storage market by refusing to sell depleted fields or by applying unfavourable terms and conditions as compared to those applied to MOL Storage. MOL’s financial interest arises from the possibility to receive dividends from MOL Storage’s profits corresponding to its shareholding and to obtain capital gain on the increase in value of its shareholding resulting from the company’s greater profitability (even if no dividends are distributed). Such discrimination strategy is not expected to induce a decrease in MOL E&P’s revenues deriving from the sale of depleted gas fields (as it would favour MOL Storage to the detriment of its potential competitors) and would strengthen MOL Storage’s gas storage services input foreclosure strategy mentioned above.
- (514) In addition, due to the structural links between MOL and MOL Storage, MOL Transmission will have the incentive to favour the development of MOL Storage’s new storage facilities as compared to its competitors, in terms of connection to its gas transmission network. In their reply to the SO²¹⁴, the parties argue that “*the transaction reduces the incentive of MOL E&P to sell sites exclusively to MOL Storage, because the transaction weakens the relationship between MOL E&P and MOL Storage*”.
- (515) While the Commission acknowledges that the ownership unbundling of gas supply activities (MOL WMT) on the one hand, and gas production activities (MOL E&P), future storage sites (MOL E&P) and transmission activities (MOL Transmission) on

²¹³ See the MOL Plc document “Opportunities for UGS capacity expansion”, submitted by the parties in reply to question 71 in the Commission’s request for information.

²¹⁴ Annex 1 page 26.

the other hand brings, in principle, positive effects, the Commission nonetheless is of the opinion that that the cross-shareholdings, the existence of the put option for MOL Transmission, the Supply Agreement with MOL E&P and the call option for MOL Storage to purchase depleted fields from MOL E&P impair the “effectiveness” of the unbundling of those activities and, by maintaining a structural link between MOL and the new entity, significantly limit the scope of the positive effects described by the parties.

- (516) At any rate, even in the absence of this structural link, the Commission stresses that the parties have, as a matter of fact, negotiated a call option which grants MOL Storage a right of “first choice” on the best fields to be developed into storage facilities and which will, in all likelihood, act as a barrier to entry into the gas storage market for the foreseeable future.
- (517) To conclude, the Commission believes that, following the transaction, the new entity will have the ability and the incentive to discriminate against its competitors in the downstream gas markets for their access to storage capacity. MOL Storage already had the ability to exploit its dominance on the market for the storage of gas in Hungary prior to the transaction, but the transaction strengthens its incentives to do so by creating a fully vertically-integrated undertaking along the gas supply chain.
- (518) Moreover, owing to the call option foreseen in the SSA, E.ON will have the ability and the incentive to make new entry into the storage market impossible, at least in the short-medium term.
- (519) Finally, owing to the structural link between MOL and MOL Storage, MOL will have the ability and the incentive to contribute to raising barriers to entry into the storage market.
- (520) For these reasons, the Commission is of the view that the merger will significantly impede effective competition in a substantial part of the common market within the meaning of Article 2 of the Merger Regulation, as the new entity is likely to discriminate against its competitors in the downstream gas markets for their access to storage capacity and is likely to make new entry into the storage market impossible.

(iii) Transmission of gas

- (521) MOL Transmission owns and manages the gas high pressure grid in Hungary including the two entry points for imports. MOL Transmission also acts as system operator, in charge of the continuous and transparent operation and balance of the integrated natural gas system.
- (522) MOL Transmission is not part of the proposed transaction. However, as already mentioned, the parties have concluded an agreement whereby MOL is granted a “put option” under which MOL may sell to E.ON either a 25 % plus 1 share or a 75 % minus 1 share interest in MOL Transmission during the next two years. E.ON has stressed that it has no influence to request MOL to exercise this put option.

a. Nabucco pipeline

- (523) Respondents to the Commission's investigation have argued that the mere existence of this put option may provide E.ON with a strong influence over MOL Transmission, which means that the market for the transmission of gas may also be affected by the merger, even prior to the exercise of the put option.
- (524) In particular, respondents to the market investigation have expressed the concern that the new entity may be able to influence MOL Transmission's strategy post-merger and to have an impact on the transit options to other European countries. Market participants have reported to the Commission that E.ON already had de facto a decisive influence on new pipeline projects going through Hungary.
- (525) Serious concerns have been raised in relation to the Nabucco project dealing with a new pipeline going from Turkey to Austria, crossing Bulgaria, Romania, and Hungary to bring Caspian and Middle Eastern gas to European markets. The pipeline's operation phase is expected to start in 2011/2012 and its yearly capacity will be either [25-30] bcm (base case scenario) or [30-35] bcm (high case scenario). Around [10-20] bcm are expected to be available at the Baumgarten Austrian hub for further transmission and distribution in Europe. The project has received the support of the European Union (TEN Programme) and plays a key role in diversifying the European Union's gas sourcing.
- (526) Two respondents to the market investigation directly involved in the project have claimed that the project had already been delayed by the proposed transaction. According to these third parties, while all other partners were about to sign the JV agreement in March 2005, MOL Transmission indicated that it would first need to obtain the approval of E.ON Ruhrgas.
- (527) More importantly, these companies have also raised the concern that MOL Transmission could be unwilling or unable to contribute to the development of the project over the duration of the put option. Any such development could have an impact not only on the availability of alternative sources of gas for new entrants in Hungary but also on the security of supply and sourcing policy of Hungary and the rest of the European Union.
- (528) E.ON's incentives would be two-fold. First, according to these third parties, the Nabucco pipeline, which offers a chance to bring significant quantities of non-Russian gas to Europe, could interfere with Gazprom's commercial strategy in Europe. In the opinion of the parties involved in Nabucco, this gas could even be competitive on the Polish, Czech, Ukrainian and Belarusian markets, which are currently essentially supplied by Gazprom. In view of the strategic relationship between Gazprom and E.ON, Gazprom may therefore influence E.ON's position in order to delay or impede the success of the project. Secondly, E.ON would also have an incentive not to favour new pipelines entering Hungary to prevent new competitors from entering the Hungarian gas markets.
- (529) The Commission has carefully assessed the concerns raised by these third parties but could however not come to the conclusion that the proposed transaction was likely to impede or delay significantly the construction of the Nabucco pipeline.

- (530) The Commission first notes the company involved in the Nabucco joint venture is no longer MOL Transmission but its parent company MOL (MOL Rt.)²¹⁵. The joint venture agreement was signed by the five Nabucco partners in July 2005. E.ON is thus not in a position to have a decisive influence on the project development and MOL is likely to continue to support the construction pipeline if the further economic analysis and the project financing confirm that it will be profitable for its joint owners.
- (531) Moreover, the Commission's investigation did not provide indications that E.ON had strong incentives to oppose the new pipeline project. While the strategic relationship with Gazprom may have a bearing on E.ON's position²¹⁶, E.ON is also certainly interested in diversifying its gas sourcing portfolio in Europe and the Nabucco project could bring E.ON significant advantages in this respect.
- (532) For these reasons, the Commission has concluded that the proposed transaction is not likely to impede or significantly delay the Nabucco pipeline project, as the result of which competition could be significantly impeded in a substantial part of the common market.

b. Transmission of gas in Hungary

- (533) With respect to the impact of the proposed transaction on gas transmission within Hungary, respondents to the market investigation have argued that MOL Transmission will be in a position to favour E.ON in the allocation of cross-border or national capacities, although such behaviour would be subject to monitoring by the HEO. Moreover, it has been argued by some respondents that the existence of the put option may lead MOL Transmission to "freeze" the development of its network (e.g. new entry capacity) during the period up to the deadline for the put option, while waiting to decide whether the option will be exercised or not.
- (534) As MOL Transmission is not part of the notified transaction, the full effect of the contemplated put option, which would further strengthen the vertical integration of E.ON, is not assessed in this document. However, the Commission acknowledges that the mere existence of the put option is likely to have an impact on the functioning of the markets and the management of the gas infrastructure in Hungary.
- (535) Furthermore, as already indicated, according to the Share Purchase Agreement signed by the parties, MOL (which will continue to control MOL Transmission) will retain a 25%+1 shareholding in MOL WMT, which will be controlled by E.ON, thereby creating a structural link between MOL and the merged entity. An additional commercial link arises from the Supply Agreement concluded between MOL (MOL E&P) and MOL WMT for the sale of domestic gas. This commercial relationship between MOL and MOL WMT is likely to reinforce the structural link.
- (536) The 25%+1 minority shareholding that MOL would retain in MOL WMT and the above-mentioned commercial relationship give MOL Transmission an incentive to discriminate against E.ON's downstream competitors when granting access to the

²¹⁵ Parties' reply to the Commission request for information dated 19 July 2005 – Question 101.

²¹⁶ In particular in light of E.ON's participation in the Baltic pipeline project led by Gazprom.

transmission network. MOL's financial interest arises from the possibility to receive dividends from MOL WMT's profits corresponding to its shareholding and to obtain capital gain on the increase in value of its shareholding resulting from the integrated new entity and MOL WMT's greater profitability (even if no dividends are distributed) owing to MOL Transmission granting it a favourable treatment. As for the gas input foreclosure, such non-price discrimination strategy is not expected to induce a decrease in MOL Transmission's revenues (as it would favour MOL WMT to the detriment of its competitors) and would strengthen MOL WMT's gas input foreclosure mentioned above.

- (537) As a matter of fact the vertical integration of E.ON downstream (notably through its majority and minority participation in three gas RDCs) represents the fundamental difference vis-à-vis the situation pre-transaction, as MOL is/was not active in the downstream gas market. The incentive therefore exists to reinforce the gas input foreclosure strategy to the detriment of E.ON's competitors downstream through discriminatory behaviour in granting access to the transmission network.
- (538) Whilst it has to be stressed and acknowledged that the operation of the transmission grid is highly regulated by the HEO, MOL Transmission is still likely to have the ability and incentive to favour MOL WMT for the access to the transmission network.
- (539) Moreover, as already mentioned, the Network Code contains the detailed technical rules for the operation of the gas system. The Network Code is drafted by the Network Code Committee.
- (540) It has to be highlighted that E.ON may, post transaction, directly or indirectly control the majority of the 9 members of the Committee, who are either representatives of or elected by the various licensees active in the gas sector²¹⁷. Since changes to the Network Code are decided by simple majority, E.ON is therefore likely to be in a position to influence the way in which the Network Code may be re-drafted/updated in the future with the objective/effects of discriminating against E.ON's competitors in the allocation of capacity along the grid and to favour MOL WMT over new entrants.
- (541) Furthermore, as described, capacities along the transmission (and storage) chain are crucially divided into Already Allocated Capacity (AAC) and Free Capacity (FC) in accordance with Article 1(30) of the Executive Decree.
- (542) Generally, MOL WMT will be in a position to exploit its priority position for the allocation of transmission capacity by over-nominating its capacity needs, in spite of the requirement that capacity only be booked on the basis of confirmed consumption/customer demand. As a matter of fact a third party indicated that the system's "*technical capacity*" is 20-30% higher than "*regulatory capacity*"²¹⁸, meaning that most if not all operators tend to book more capacity than actually needed. This has the effect of congesting the system and the objective/effect of raising barriers to entry for new suppliers.

²¹⁷ See Chapter 3.1 of the Network Code.

²¹⁸ See minutes of meeting with EMFESZ of 28 July 2005.

- (543) By overbooking its priority transmission capacity, MOL WMT would increase the system's congestion. As a result, the "lower priority" capacity would become scarcer, thus raising additional barrier to entry on the open segment of the market.
- (544) Moreover, Free Capacities ("FC") are measured by the TSO (i.e. MOL Transmission) according to a methodology which has to be approved by the HEO. Capacities are allocated by the TSO to market players within a maximum of three months subsequent to their application.
- (545) In case of "overbooking" of FC, the procedure for allocation foresees an "auction", pursuant to point 5.1.3.1(g) of the Network Code. The Network Code however does not specify how these auctions should take place and within which timeframe. The parties have argued that this auction process "*usually takes two weeks to complete*".
- (546) Arguably, in the presence of the MOL Transmission's incentive to discriminate in favour of the new entity, this auction processes could be managed in a non-transparent, discriminatory manner, or with undue delay, to the detriment of third parties. In the expectation that the liberalised market may grow after 2007, instances of discriminatory behaviour are still likely to occur in the allocation of FC to market operators. This discriminatory behaviour would be particularly harmful during the initial phase of liberalisation.
- (547) In their reply to the SO, the parties underline that the transaction will bring about the ownership unbundling between gas wholesale and gas transmission. Although the ownership unbundling of gas wholesale and transmission activities brings in principle positive effects, the Commission notes that the cross-shareholdings, the existence of the put option for MOL Transmission and the Supply Agreement with MOL E&P do not achieve a full unbundling of those activities and significantly limit the scope of the positive effects described by the parties.
- (548) In their reply to the SO, the parties contest that the "*timing and degree of [the transmission network] development*" may be negatively impacted by the transaction. On the contrary, the parties claim that it "*depends totally on consumer demand and the approval of the Hungarian regulator*"²¹⁹. While this assertion may be verified in normal business conditions, the Commission estimates that the uncertainties about MOL Transmission's ownership are likely to negatively impact the company's ability to carry out and plan long term projects.
- (549) To conclude, the Commission believes that MOL Transmission is likely to have the ability and the incentive to discriminate against E.ON's competitors in granting access to the gas transmission network, owing to the structural link resulting from the 25%+1 minority shareholding of MOL into MOL WMT. MOL Transmission already had the ability to exploit its dominance on the gas transmission market in Hungary prior to the transaction. The structural link created by the transaction will strengthen its incentives to do so in view of the vertical integration of the new entity along the gas supply chain.
- (550) Moreover, the Commission is also concerned that, pending the exercise of the put option, the development of the network (for instance additional entry point capacity)

²¹⁹ Reply to the SO, Page 22.

may be put on hold while waiting to see who the “final” owner of such projects would be.

- (551) For these reasons, the Commission is of the view that the merger will significantly impede effective competition in a substantial part of the common market within the meaning of Article 2 of the Merger Regulation, as the new entity is likely to discriminate against its competitors in the downstream gas markets for their access to transmission capacity.

C. Impact of the transaction on the electricity markets

- (552) In addition to the concerns related to the gas sector presented in section B above, the Commission’s market investigation has identified competition concerns on various electricity markets, as a result of the vertical integration of MOL WMT’s activities in the upstream market of gas supply to large power plants with E.ON’s activities in the downstream markets of electricity generation/wholesale and electricity retail.
- (553) Prior to the transaction, MOL WMT is dominant on the market for the supply of gas to large power plants, whereas it is not active in the electricity markets. On the contrary, E.ON already has a strong position on the electricity retail markets in Hungary and is likely to become significantly active on the generation/wholesale electricity markets.
- (554) The Commission’s market investigation has revealed that, following the merger, the new entity will have the ability and the incentive to raise the costs of future and existing gas-fired power plants in Hungary. The Commission is also concerned that the new entity will have the ability and the incentive to supply competitive gas to future and existing gas-fired power plants under the condition that they sell their electricity production to E.ON’s RDCs or trading subsidiary at favourable conditions (“tolling strategy”).
- (555) The economic interest to pursue these strategies will increase with the further liberalization of the electricity sector in Hungary and the increase in E.ON’s share in electricity generation. These two likely strategies would also prevent existing and future rival electricity generators/wholesalers from competing effectively in the markets for the wholesale supply of electricity to traders²²⁰.
- (556) The new entity’s strategy in electricity generation / wholesale would lead to a restriction of new electricity generation capacities in Hungary and would therefore have an impact on electricity wholesale prices in the country. The “tolling agreements” strategy would restrict E.ON’s electricity retail competitors’ ability to get competitive supplies of electricity, thereby significantly impeding effective competition on electricity retail markets. In addition, the transaction will give E.ON the ability and incentive to prevent its electricity retail competitors from developing dual offers (electricity and gas) in Hungary. This would further increase E.ON’s market power on the electricity retail markets in Hungary.

²²⁰ In addition, third parties have indicated that, since 80% of heat production in Hungary is gas-fired, E.ON will have the same ability and incentive as regards heat production as for electricity. Therefore the transaction will lead to similar anticompetitive effect in the district heating sector.

(557) The Commission's assessment of the effects of the transaction on the electricity markets in Hungary has been carried out both under current market conditions and within the foreseeable future, taking account of the most likely scenario following the implementation of the New Electricity Model in Hungary.

(558) The position of E.ON and other market players in the electricity sector is first presented before setting out in detail the competition concerns resulting from the transaction at the electricity generation / wholesale and electricity retail level.

(i) *Market players in the electricity sector in Hungary*²²¹

(559) Besides E.ON, MVM and several large European electricity groups are active in Hungary at the generation, the wholesale or the retail level. Smaller electricity trading companies have also developed more recently.

a. E.ON

(560) E.ON has made significant investment in the electricity sector in Hungary since 1995/96. The group is currently active at the generation level with a gas-fired power plant in Debrecen, and at the wholesale and retail supply level with ownership of three out of the six electricity RDCs and the electricity trading company E.ON EK. In addition, E.ON controls various companies involved in electricity retail supply in Hungary's neighbouring countries.

Electricity generation

(561) E.ON owns a medium size gas-fired power plant and several smaller generation facilities in Hungary which produce both electricity and heat (for district heating purposes). These facilities had a total production of [0-2]* TWh in 2004, accounting for [5-15]*% of Hungarian gas-fired electricity and [0-5]* % of Hungarian electricity generation. It should be noted that E.ON has plans to expand significantly its generation capacity.

(562) In 2004, E.ON's largest power plant (Debrecen) sold almost²²² its entire electricity production ([500-1,000]* GWh) on the regulated segment of the market, in the frame of a long-term PPA with TITÁSZ²²³. Most of E.ON's plants are also used for heat production. E.ON is the sole heat generator/supplier for the district heating of two large cities (Debrecen and Nyíregyháza). However, at the national level, E.ON's share in heat production amounts to [5-10]*%.

(563) The assessment of E.ON's position in electricity generation in Hungary should also take into account the importance of gas-fired power plants in the Hungarian electricity markets, as explained by most market players. For instance, a third party active in the electricity sector has highlighted that:

221 None of the companies controlled by MOL is active in the production or supply of electricity in Hungary. MOL only indirectly owns minority interests in TVK-Erőmű, a 50 MW gas-fired cogeneration plant.

222 DKCE sold in 2004 minor quantities of electricity to [...] on the free market ([0-500]* MWh).

223 TITÁSZ is wholly owned by E.ON.

“The fact that E.ON currently only owns 2.8% of electricity generation capacity may be misleading. First, as regards electricity produced from gas for system balancing, suppliers with even a small percentage have market power because it is not possible to live without this electricity.”

- (564) Finally, E.ON is also active in power generation in Austria, through its interests in Donau Kraftwerk Jochensten AG (“DKJ”) and Österreichisch-Bayerischen Kraftwerk AG (“OBK”). DKJ and OBK have respectively power generation capacity of [0-200]* MW and [200-500]* MW and produced [500-1,000]* GWh and [1,000-2,000]* GWh in 2003.

Electricity wholesale

- (565) E.ON EK started its activities as electricity trader in Hungary in March 2003. In 2003, E.ON EK traded [0-5]* TWh of electricity and this quantity increased to [0-5]* TWh in 2004. The company sells electricity exclusively to MLCs and not to electricity traders. E.ON EK is one of the three major Hungarian electricity traders, with the ATEL group and MVM.
- (566) In 2004, the company sourced the large majority of its electricity from imports ([0-5]* GWh), essentially from the group’s German electricity trading subsidiary (“EST”) ([35-45]*% of E.ON EK’s imports) and through the Slovak interconnection ([85-95]*% of E.ON EK’s imports). Domestic sources ([0-2]* GWh) were MVM auctions ([0-500]* MWh) and Electrabel ([0-500]* MWh).

Electricity RDCs

- (567) E.ON has sole control of three of the six RDCs: TITÁSZ, ÉDÁSZ and DÉDÁSZ. In 2004, those three RDCs supplied respectively [0-5]* TWh, [5-10]* TWh and [0-5]* TWh of electricity to residential customers, SCs and MLCs in their respective regions and in the public utility segment.

Electricity retail in neighbouring countries

- (568) E.ON is also active on the electricity retail markets in Hungary’s neighbouring countries. In Slovakia, the group has a 49% interest in Zapadoslovenska Energetika a.s. (“ZSE”), active in retail supply of electricity. In 2003, ZSE had total electricity sales of [5-10]* TWh, accounting for [30-40]*% of the overall Slovak market. In Romania, E.ON acquired recently 51% in Electrica Moldova S.A (“Moldova”), also active in the retail supply of electricity. In 2003, Moldova had total electricity sales of [0-5]* TWh, accounting for [0-10]*% of the overall Romanian market.
- (569) E.ON acquired in 2003 the control of three Czech electricity regional distribution companies, ZCE, JCE and JME. Together, these three companies supplied [10-15]* TWh in 2003, accounting for [20-30]*% of the overall Czech electricity market. It is worth mentioning that ZCE’s, JCE’s and JME’s in the Czech Republic, ZSE’s in Slovakia and ÉDÁSZ’s and DÉDÁSZ’s geographic areas in Hungary have contiguous borders. Finally, E.ON also has a majority interest in the electricity distribution companies Varna and Gorna in Bulgaria, which together accounted for [15-25]*% of total Bulgarian electricity market in 2003 with sales of [0-5]* TWh.

(570) Although there is currently no relationship between E.ON's electricity retail assets in Eastern Europe, E.ON's presence in several of Hungary's neighbouring countries allows E.ON to import electricity into Hungary. In addition, E.ON may enjoy an additional competitive advantage in terms of brand recognition, reputation and ability to supply large chain customers with branches in several countries.

b. MVM

(571) MVM is the former monopoly electricity wholesaler and electricity transmission grid operator in Hungary. During the energy sector privatization in 1995/1996, Hungarian power plants and RDCs were sold to private investors while MVM remained a state owned company, owning the electricity transmission network and retaining the ownership of the Paks nuclear power plant and other power plants. Since the opening of the market to competition in 2003, MVM has maintained a leading role in electricity wholesale, as public utility wholesaler and as trader on the open segment of the market.

- Generation

(572) MVM owns the Paks nuclear power plant, the Hungarian largest power plant, and several medium-size gas-fired or coal-fired power plants. The Paks nuclear power plant produced [10-12.5] TWh in 2004, entirely sold in the public utility segment. The company owns a 25% stake in the gas-fired Dunamenti power plant, the second largest power producer in Hungary.

- Electricity wholesale

(573) As the licensee for public utility wholesale, MVM has long-term contractual relationships with the majority of large electricity generators on the one hand and the electricity RDCs on the other hand. In 2004, the company sold [25-27.5] TWh in the public utility segment, to be compared to a total electricity consumption of [37.5-40] TWh in Hungary. The company organises auctions every six months to sell its surplus power to traders.

- Electricity retail

(574) MVM fully owns MVM Partner Rt. ("MVM Partner"), active in the Hungarian free electricity market. In 2004, the company sold [2.5-5] TWh on the open segment of the market and was the second largest electricity trader.

c. MAVIR

(575) MAVIR is the current transmission system operator in Hungary. The company started its operations in January 2001 according to a "Base contract" with MVM. Initially, MAVIR was part of the MVM group, but after the adoption of the HEA in December 2001, MAVIR's ownership was transferred to the MET in December 2002. MAVIR obtained the licence for System Operation in January 2003.

- (576) Following a recent government decree²²⁴ of July 2005, the ownership of MAVIR has been transferred to MVM. The ownership of the Hungarian electricity transmission grid has been transferred from MVM (parent company) to MAVIR.
- (577) Due to the long-term PPAs contracted by MVM, MAVIR procures the electricity needed for system balancing mainly from MVM.

d. International groups

RWE

- (578) RWE is active at the generation level, with a majority stake in the Mátra lignite power plant²²⁵, at the retail supply level (public utility segment), with majority stakes in two electricity RDCs (ELMŰ and ÉMÁSZ) and at the wholesale and retail level with the electricity trader MÁSZ, a 50/50% joint venture between ELMŰ and ÉMÁSZ. In 2004, ELMŰ, ÉMÁSZ and MÁSZ had respective electricity sales of [7.5-10] TWh, [2.5-5] TWh and [0-2.5] TWh.

EDF

- (579) In Hungary, EDF is present through its subsidiaries BERT, active in cogeneration and the electricity RDC DÉMÁSZ. BERT owns three medium size CCGTs with a total generation capacity of [250-500] MW. BERT's electricity production amounted to [0-2.5] TWh in 2004 and was entirely sold in the public utility segment.
- (580) DÉMÁSZ supplies electricity in the public utility segment and sold [2.5-5] TWh in 2004. The company has established an electricity trading subsidiary named D-Energia. The latter sold [0-250] GWh and [250-500] GWh on the liberalized market in 2003 and 2004 respectively.

Electrabel

- (581) Electrabel-Suez is a French/Belgian group active on several European electricity and gas markets. The group owns the second largest electricity production facility in the country, Dunamenti Erőmű (gas-fired), with a total capacity of [1,500-1,750] MW²²⁶. In 2004, the power plant produced [2.5-5] TWh and [...] of this capacity was sold to MVM in the public utility segment. Electrabel-Suez is not active in electricity retail in Hungary.

ATEL

- (582) The Swiss group ATEL owns the gas-fired Csepeli power plant. It has a [250-500] MW generation capacity and produced [0-2.5] TWh in 2004, which were entirely sold in the public utility segment. The Csepeli power plant is the most recent large power plant in Hungary and started its operations in November 2000.

²²⁴ Government decision 1070/2005 of 8 July 2005

²²⁵ RWE holds a 50.9% stake in Mátra. Lignite is produced in Mátra-owned mines.

²²⁶ Additional generation units installed in the 60's (530 MW capacity) are currently being mothballed.

(583) The group is also active at the retail level through the two electricity traders ATEL Energia Kft. (“ATEL Energia”) and Entrade Hungary Kereskedelmi Kft.²²⁷ (“Entrade Hungary”), which respectively sold [0-2.5] TWh and [0-2.5] TWh on the open segment of the market in 2004. Combined, the two trading companies constitute the largest electricity trader in Hungary. The Csepeli plant does not have commercial relationship with ATEL Energia nor with Entrade Kft.

Others

(584) The other major market players in electricity generation are the AES group, which owns the AES Tisza gas-fired power plant and the Borsod coal power plant, and the group PannonPower Holding Rt. (“Pannon Power”) which owns the Pannon Hőerőmű gas power plant in Pécs.

(585) Several electricity traders are active on the open electricity markets in Hungary, the largest being System Consulting²²⁸, Sempra Energy Europe and Energy Financing Team Budapest. Elektra Energia and ETC Hungary started their activity more recently and the trading company Energy Capital is planning to enter in the short term.

(586) The table below provides an overview of the main market player’ position in electricity generation²²⁹ and retail supply level in Hungary.

	MVM	E.ON	RWE	EDF	Electrabel	ATEL	Others	TOTAL
Electricity generated in 2004 (GWh)	[10000-12500]	[0-2500]*	[5000-7500]	[0-2500]	[2500-5000]	[0-2500]	[5000-7500]	[30000-35000]
2004 - %	[30-40%]	[0-5%]	[10-20%]	[0-10%]	[10-20%]	[0-10%]	[20-30%]	100%
Electricity sales to final users in 2004 (GWh)	[2500-5000]	[12500-15000]*	[12500 - 15000]	[2500-5000]	0	[2500-5000]	[0-2500]	[35000-40000]
2004 - %	[0-10%]	[40-45%]	[30-40%]	[10-20%]	[0-10%]	[0-10%]	[0-10%]	100%

²²⁷ ATEL acquired at the beginning of 2005 the company Entrade GmbH, the owner of Entrade Hungary.

²²⁸ System Consulting is an independent company that imports electricity from Ukraine to Hungary for resale to traders in Hungary and for exports. System Consulting is only active at the wholesale level and does not sell electricity to any final customer.

²²⁹ As explained above, electricity generation does not constitute a relevant product market for the assessment of this transaction but is part of the generation/wholesale product market. “Electricity sales to final users” include sales in all retail electricity markets.

(587) As reflected in the above table, E.ON is the main player in the Hungarian electricity retail markets, with a market share in excess of 40%, due to its strong position both in the public utility segment and as an electricity trader.

(ii) *Electricity generation/wholesale*

(588) MOL already has the ability to exploit its position of gatekeeper of gas resources in Hungary prior to the transaction. The fundamental change brought about by the transaction is that the new entity will now also have the incentive to do so owing to the creation of a fully vertically-integrated undertaking along the gas and electricity supply chain.

(589) The Commission believes that, as the result of the proposed transaction, E.ON will have the ability and the incentive to foreclose access to gas to its competitors in electricity generation due its dominant position in the wholesale supply of gas to power plants. E.ON will also have the ability and incentive to discriminate against gas-fired power plant that do not supply its subsidiaries active in electricity retail and to engage in “tolling agreements” with new gas-fired power plants.

(590) E.ON is likely to pursue these strategies in view of its strategic plans to significantly develop its electricity generation capacity and its economic interest in obtaining competitive electricity supplies. These strategies would result in a restriction of new electricity generation capacities by other / independent market players and would strengthen E.ON’s market power and lead to an increase in electricity wholesale prices.

(591) In their reply to the SO, the parties claim that the proposed transaction will not bring about any change in MOL WMT’s strategy vis-à-vis power plants and contest the new entity’s economic interest in engaging in foreclosure strategies. The Expert Report submitted by the parties states²³⁰ that this “*would be equally likely in the absence of the proposed transaction, because the existing power stations of E.ON/ERI do not provide any head-start in the long road to monopolizing the power market*”. On the contrary, the Commission believes that the proposed transaction brings about significant changes in MOL WMT’s incentives in view of E.ON’s strategic focus on building/acquiring additional generation capacity in Hungary and of its strong position in the electricity retail supply markets.

(592) The parties also insist on E.ON’s currently limited generation capacities and argue that “*E.ON will remain a small player [in the market for electricity generation] without significant market power*”.²³¹ However, post transaction, E.ON will be dominant upstream from electricity generation / wholesale (wholesale supply of gas to power plants) and will have a very strong position in the downstream markets (electricity retail). This position will confer E.ON with unrivalled advantages to further increase its market power along the electricity supply chain.

(593) The following recitals will first present the current structure of electricity generation in Hungary and its likely evolution. The new entity’s ability to foreclose access to

²³⁰ Expert Report, Page 22/23.

²³¹ Reply to the SO, Page 24.

gas to its competitors in electricity generation will then be assessed and E.ON's focus on developing new generation capacities will be presented. The new entity's incentives to engage in the strategies mentioned above in recital 589 both in the current and in the future regulatory framework will finally be analysed.

a. The structure of electricity generation in Hungary

(594) The following recitals will present the current structure of electricity generation in Hungary and its likely evolution, based on information on new power plants and power plants decommissioning gathered by the Commission in its in-depth market investigation. The importance of gas-fired power plants in the current regulatory framework as well as in new generation capacities will be underlined.

Current generation structure

(595) Total generation capacity in Hungary is approximately 8,000 MW in 2005, to be compared with the country's peak load of 6,350 MW (in 2004). The Hungarian electricity generation is split between nuclear energy (1,800 MW installed capacity) and lignite, gas and coal power plants (5,700 MW installed capacity). Almost 40% of electricity consumed in Hungary is generated by the Paks nuclear power plant, the remaining 60% is mainly generated by power plants burning hydrocarbons (lignite, gas and coal) and by imports.

(596) In 2005, 19 power plants had a generation capacity exceeding 50 MW:

Large power plants in Hungary²³²:

Name of power plant	Owner	Fuel	Official production capacity in 2003 (MW)	Official production in 2003 (GWh)	Market investigation: current production capacity (MW)	Market investigation: production in 2004 (GWh)

PPAs

(597) The major part of the large power plants' capacity is booked under long-term PPA with MVM. The market investigation has established that the total capacity booked under those PPAs amounted to [4,000-5,000 MW] in 2005, compared to the total national generation capacity of approximately 8,000 MW. The table below indicates the existing long term PPAs with MVM and their end-date.

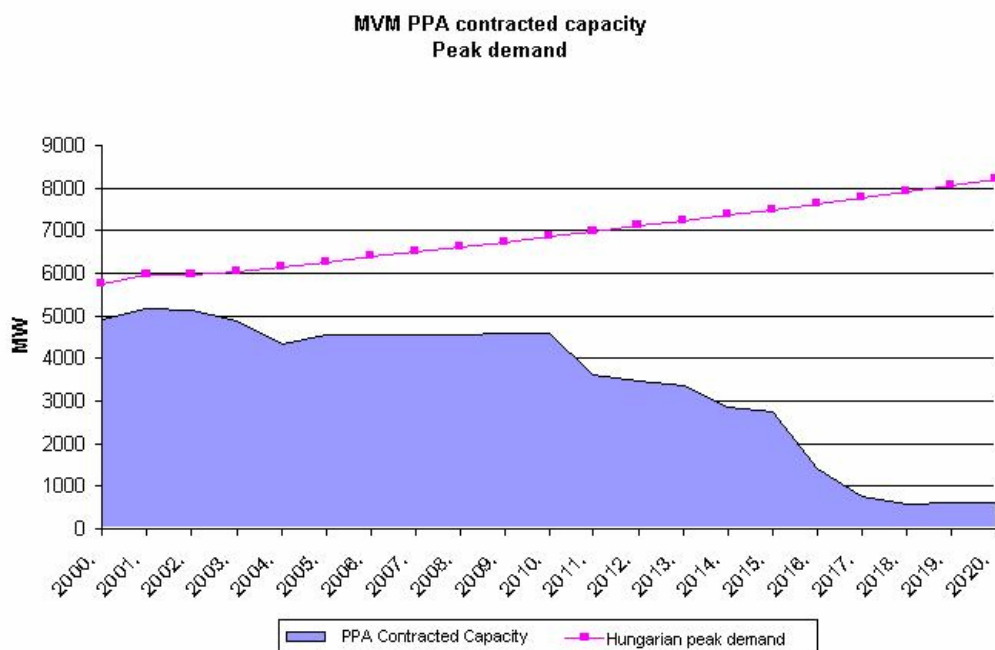

Existing long-term PPAs:²³³

Power plant	Owner	Fuel	Official production capacity in 2003 (MW)	Official production in 2003 (GWh)	PPA: Reserved capacity	PPA: End date

(598) Competition on the market for the wholesale supply of electricity to traders is therefore limited to large power plants to the extent of their non-reserved capacity and smaller power plants. Generation capacities booked under those long-term PPAs are expected to decrease progressively as PPAs are renegotiated or come to expiry. In addition, new power plant are, in principle, not expected to enter into such long-term PPAs with MVM and will therefore play a significant role on the market for the wholesale supply of electricity to traders. The table below illustrates the progressive reduction in the scope of the PPAs.

Evolution of the capacity reserved under long term PPAs:

Source: HEO

New power plants projects

(599) As mentioned above in recitals 150 and 151, it is estimated that large electricity generation capacities will be needed in Hungary in the coming years. New generation capacity of approximately 5,000 MW has to be built until 2020 to replace old power plants²³⁴ (3,500 MW) and to satisfy the increase in demand. This figure accounts for roughly 60% of the total production capacity currently installed in Hungary. Accordingly, the Hungarian electricity generation capacity should increase from 8,000 MW to approximately 10,500 MW.

(600) The market investigation has indicated that, as of December 2005, around [1,000-1,500] MW of new generation capacity is planned to be constructed by 2010, both in new power plants and in capacity replacement / expansion in existing power plants. All these projects relate to gas-fired power plants or units, which will play an

²³⁴ The old coal-fired power plants are expected to be closed down for environmental reasons. Another possibility is to use new technologies, with lower impact on the environment and higher efficiency.

important role in the market for the supply of gas to traders, in particular in view of their ranking in the Hungarian electricity generation merit curve²³⁵. As regards the 2010-2015 period, the market investigation has shown that approximately 2,000 MW of additional generation capacity is envisaged although the degree of uncertainty is higher. The majority of projects are gas-fired, as evidenced by the following pie chart:

Breakdown of new capacity generation by type of fuel (new projects and capacity extensions until 2015):

- (601) According to this investigation, the main projects to build new large power plants in Hungary will be carried out by E.ON. All other new power plant projects which are considered with a sufficient degree of certainty by other market players are of smaller size than those of E.ON.
- (602) According to the HEO, power plant construction licenses have been granted for a total generation capacity of [0-500] MW until now. In addition, the HEO has received informal information about additional plans to build [1,000-1,500] MW generation capacity. Among those new power plant projects, [500-1,000]* MW are planned by E.ON. According to MAVIR²³⁶, E.ON intends to build either a 500 MW coal-fired power plant or a 2 x 400 MW gas-fired power plant.
- (603) E.ON has confirmed that it is considering [...] but noted that these [...] power plant projects are at an early planning stage and have not yet received all the required internal approvals. E.ON's internal documents submitted to the Commission²³⁷ [...]*. In addition, while MAVIR and another market player mentions a 2x400 MW power plant project in Gönyű, E.ON's internal documents [...]*.

²³⁵ See section above on the Electricity sector in Hungary and the graph of the Hungarian electricity generation merit curve.

²³⁶ MAVIR network planning realized in the spring of 2005. E.ON contributed to the realization of this analysis and requested MAVIR to take the two power plant projects into consideration.

²³⁷ E.ON internal documents submitted in the Reply to the Commission's questionnaires dated 18/07/2005 (Question 122).

- (604) As regards other market players, [Confidential: Overview of E.ON's competitors new power plants projects].
- (605) [Confidential: Overview of E.ON's competitors new power plants projects]
- (606) [Confidential: Overview of E.ON's competitors new power plants projects]
- (607) The tables below summarize the new power plants or power plant capacity expansions planned by 2015, with a capacity above 50 MW. Only projects that were confirmed by the relevant companies have been reported.

New power plants projects (gas-fired):

Location	Company / Group	Fuel	Capacity (MW)	Schedule

[...]*	E.ON	Coal	[250-500]*	Planned – [...]*
[...]	[...]	[...]	[250-500]	[...]

Capacity expansion (gas-fired):

Location	Company / Group	Fuel	Capacity (MW)	Schedule
[...]	[...]	Gas	[0-250]	[...]

²³⁸ According to E.ON internal documents submitted in reply to the Commission's questionnaire dated 18 July 2005 (Question 121).

²³⁹ According to various market players.

[...]	[...]	Gas	[250-500]	[...]
-------	-------	-----	-----------	-------

Capacity expansion (other fuels):

Location	Company / Group	Fuel	Capacity (MW)	Schedule
[...]	[...]	Nuclear	[0-250]	[...]

- (608) E.ON is also currently refurbishing its power plant in Nyíregyháza with a 49 MW CCGT, which should be commissioned in [...]*.
- (609) As regard other market players, MVM currently conducts a programme to increase the Paksi nuclear power plant lifetime by 10-15 years and to increase the reactors efficiency (from 430 MW to 460 MW). Several old gas or coal power plants are also undergoing modernization and efficiency improvement programmes.

Limited potential for non gas-fired power plants

- (610) The Expert Report submitted by the parties explains that the new entity's gas foreclosure strategies' would not be successful²⁴⁰ as competitors may invest in non-gas fired power plants. Although the parties claim that competitors could develop non gas-fired power plants, they fail to indicate on which alternative fuel new power plants would rely and do not provide any analysis on the competitiveness of those alternative fuels.
- (611) The Commission refers to the above market investigation on existing new power plants projects in Hungary and on the statements made by all the major market players in the electricity sector related to the predominance of gas as fuel for new power plants. The market investigation has clearly indicated that gas-fired power plants would represent the largest part of new generation capacities in Hungary. For example, the HEO considers that the proportion of gas-fired power plant in new generation capacity could reach 60%.
- (612) As a matter of fact, this analysis is not disputed by the parties. In a presentation held by MOL gas division²⁴¹, the strong increase in new gas-fired electricity generation capacity is also cited as a key driver of the Hungarian gas demand:

MOL: "[...]."*

- (613) The Commission and market players estimate that none of the alternative fuels (nuclear, lignite, coal, hydro, etc.) does offer the same advantages as gas for power generation.

²⁴⁰ Expert Report, Page 4.

²⁴¹ "MOL Gas, Management presentation", March 2004. Annex 27 to Form CO.

- (614) Nuclear power plants require a very large upfront investment compared to any other type of power plant and the process to expand or build a new nuclear reactor is subject to extremely long studies and involves political considerations. There is currently no indication that a new nuclear reactor could be built and become operational before 2015.
- (615) There is only one lignite power plant in Hungary, the Mátra power plant, and it is closely linked to the exploitation of Hungary's only lignite mine. While lignite may be an efficient fuel for new power plants, [...].
- (616) Coal production is marginal in Hungary and is decreasing. Coal has to be imported with high transportation costs. In addition, old coal power plants have the highest variable generation cost in Hungary and require substantial investment to meet the stringent Community environmental standards. As evidenced by the market investigation, the large majority of power plants expected to be decommissioned by 2015 are old coal-fired power plants.
- (617) While new coal power plants may have a higher efficiency, they still emit carbon dioxide and need expensive carbon dioxide emission permits. The only project to build a new coal-fired power plant is [...]*.
- (618) A strong increase in renewable (biomass, wind, solar, etc.) generation capacities in Hungary is projected due to the favourable feed-in tariffs set by the regulation. However, these new capacities are usually not competitive and subsidized by these high tariffs. They are not expected to account for a significant part of Hungary's generation capacity before 2015.

Power plants decommissioning

- (619) The market investigation carried out by the Commission has identified projected power plants decommissioning and capacity reductions. According to the investigation, around [0-500] MW of generation capacity should be decommissioned by 2010. As regards the 2010-2015 period, approximately 1,500 MW of additional generation capacity should be decommissioned. The vast majority of power plants that are expected to close or to reduce their capacity are coal-fired; some of the oldest gas-fired units are also expected to be shut down and/or replaced.

Power plant decommissioning:

Location	Company / Group	Fuel	Capacity (MW)	Schedule
[...]	[...]	Gas	[0-250]	[...]
[...]	[...]	Gas	[500-750]	[...]
[...]	[...]	Gas	[0-250]	[...]
[...]	[...]	Coal	[0-250]	[...]
[...]	[...]	Coal	[0-250]	[...]
[...]	[...]	Coal	[0-250]	[...]

[...]	[...]	Coal	[0-250]	[...]
[...]	[...]	Coal	[0-250]	[...]
[...]	[...]	Coal	[0-250]	[...]
[...]	[...]	Coal	[0-250]	[...]

Importance of gas-fired power plants

- (620) Gas-fired power plants account for 40% of the total generation capacity installed in Hungary but represent only 25% of the total electricity produced in Hungary²⁴². The large gas-fired power plants are supplied either by MOL WMT directly through the gas transmission network or by the RDCs through their gas distribution network. The total gas consumption of gas-fired power plants amounted to approximately [3-3.5] bcm in 2004.

Name of power plant	Owner	Official capacity in 2003 (MW)	Gas supplier	Gas consumption in 2004 (million m ³)
Dunamenti	Electrabel	2,126	MOL WMT	[1,000-1,500]
Tisza II	AES	860	MOL WMT	[0-500] ²⁴³
Csepeli GT	ATEL	389	MOL WMT	[0-500]
Kispest	EDF	116	FŐGÁZ	[500-1,000]
Újpest	EDF	110	FŐGÁZ	
Kelenföld GT II	EDF	136	FŐGÁZ	
Sajószöged	MVM	120	TIGÁZ	[0-500]
Lítér	MVM	120	KÖGÁZ	[0-500]
Debrecen	E.ON	95	TIGÁZ	[0-500]*
Others				[500-1,000]
TOTAL		4,072		[3,000-3,500]

- (621) According to the parties, a 500 MW gas-fired power plant (CCGT) with a 56% thermal efficiency factor has an annual electricity output of approximately 3.5 TWh and an annual gas consumption of approximately 600 million m³, **based on a 80%**

²⁴² It is MVM that decides which power plants should produce electricity based on the marginal costs of production of the respective plants. Gas-fired power plants have a higher marginal cost of production than the nuclear and lignite plants and are therefore used to satisfy peak demand.

²⁴³ Excluding [0-250]* million m³ of inert gas. (E.ON's reply dated 29 August 2005 to various request for information from the Commission).

load factor²⁴⁴. Accordingly, the gas consumption of new gas-fired power plants planned until 2010 could be in the range of [1-2] bcm, depending on their efficiency and their load factor.

- (622) As indicated by the market investigation, gas-fired power plants play a critical role in the functioning of electricity markets as they usually provide balancing energy and set electricity wholesale prices due their ranking in the national merit order. This is also the case in Hungary.
- (623) First, due to their technical characteristics and load profile, gas-fired power plants play an essential role in the provision of balancing electricity in Hungary (mainly the Electrabel, AES and ATEL power plants). This is because Hungary has practically no hydro-power capacity, all the system balancing must be provided either by gas-fired or coal-fired power plants.
- (624) Second, gas power plants are at [...] of the merit order ranking in Hungary, after the nuclear and [...]*. This means that they are used partially for base load and for peak load and supply the fluctuation of the total demand. In countries where an organized day-ahead market²⁴⁵ (or a pool structure) exists, an essential consequence is that gas power plants determine the electricity prices as they balance supply and demand. Any change in the costs of gas-fired power plants, such as an increase in the price of gas, therefore has an impact on the price of all electricity sold on the organized market.

b. The structure of electricity imports in Hungary

Current electricity imports

- (625) Imports are essentially made by electricity traders for transit or to supply medium and large customers in Hungary²⁴⁶. MVM, the public utility wholesaler, accounted for 35% of electricity imports in 2003, while E.ON was the second importer, ahead of other electricity traders, with [10-20]*% of imports. Under interconnection capacity allocation rules, it is not possible to know the country of origin of the electricity imported (only the cross-border entry point is known) nor whether market players import electricity for their own needs or for resale.

Evolution of electricity imports

- (626) A recent and in depth study on the evolution of Hungarian electricity imports has been carried out by MAVIR in 2005²⁴⁷. According to this study, Hungarian electricity imports are expected to decline over the next ten years compared to the

²⁴⁴ E.ON's submission dated 28 October 2005.

²⁴⁵ Such a market is expected to be introduced in 2007 in Hungary.

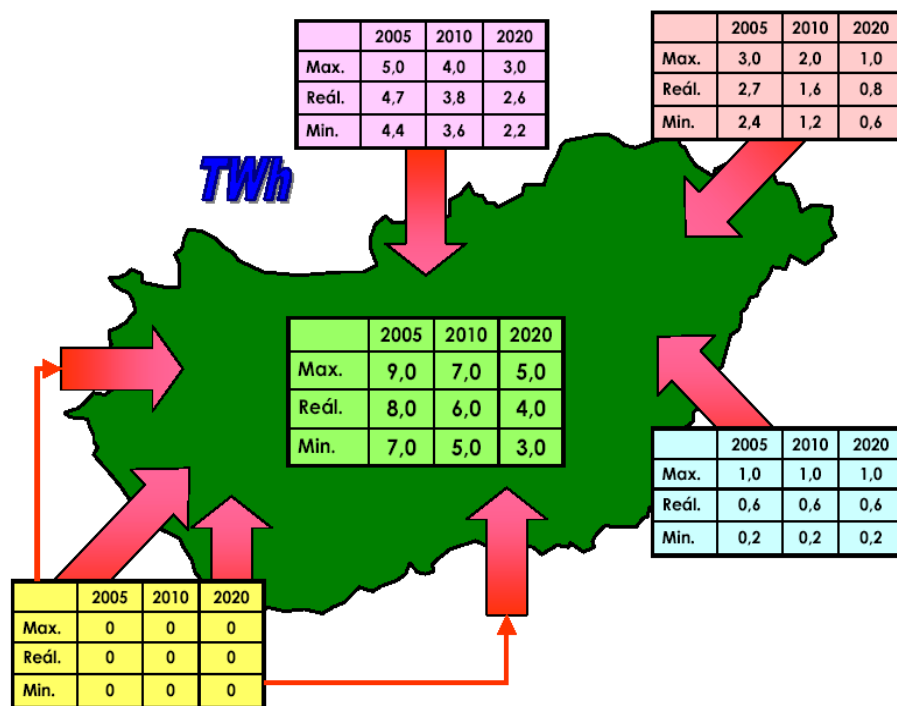

²⁴⁶ E.ON's reply to the Commission's request for information dated 18 July 2005. Electricity binder.

²⁴⁷ See:
[http://www.mavir.hu/domino/html/www/mavirwww.nsf/vAllPages/78D623653362C24FC1256FFF003D9E22/\\$FILE/korzeti_forraselemzes20050512.pdf](http://www.mavir.hu/domino/html/www/mavirwww.nsf/vAllPages/78D623653362C24FC1256FFF003D9E22/$FILE/korzeti_forraselemzes20050512.pdf)

current level, while the total electricity demand will continue to increase in Hungary. The share of electricity imports in the total electricity demand would therefore decline while the share of domestic production would increase.

- (627) The MAVIR study adopts a two-step approach; the countries which may export electricity to Hungary are first defined and then the evolution of electricity production is analyzed for each of these countries.
- (628) As a result of this study, MAVIR estimates that the current surplus in electricity generation capacities in countries that may export to Hungary will gradually decrease until 2010. As a consequence, Hungary's net electricity import balance will certainly decrease from 1200-1300 MW today to around 700-800 MW (daily peak). The chart below clearly shows that even in the best case scenario, Hungarian net electricity imports will decrease in 2010 and 2020.

Net electricity import flows and forecasts in 2005, 2010 and 2020 by country of origin:

c. The new entity will have the ability to foreclose access to gas to its competitors' gas-fired power plants

- (629) Prior to the merger, MOL WMT has a dominant position in the market for the supply of gas to large power plants. As a consequence, the Commission considers that post-merger, the new entity will have the ability to determine its competitors' power plants gas supply conditions (prices, rules for nomination, take-or-pay penalties, interruptibility, etc.) and to discriminate power generators in several ways.
- (630) Pre-transaction, as demonstrated above in section A, MOL WMT is dominant on the market for the supply of gas to large power plants, with a market share of almost 70%. Furthermore, large power plants connected to a distribution network may only be supplied by the RDCs on the regulated segment of the market (as MOL WMT can

only supply customers directly connected to the transmission network on the regulated segment of the market). RDCs are in turn obliged to procure gas for their public utility needs from MOL WMT. No trader is active on this market, as reflected in the table below:

Suppliers	Supply of gas to power plants in 2004	
	In million m ³	In %
KÖGÁZ	[0-500]*	[0-5%]
DDGÁZ	[0-500]*	[0-5%]
Total E.ON	[0-500]*	[0-5%]
MOL WMT	[2000-3000]*	[65-70%]
New entity	[2000-3000]*	[70-75%]
FÖGÁZ	[500-1000]	[10-20%]
ÉGÁZ	[0-500]	[0-10%]
DÉGÁZ	[0-500]	[0-10%]
TIGÁZ	[0-500]	[10-20%]
EMFESZ	[0-500]	[0-10%]
Total Market	[3000-4000]	100%

- (631) The market investigation has also confirmed the current and expected lack of alternative sources of supply for power plants. No other gas supplier (except the gas RDCs, which are dependent upon MOL WMT for their gas sourcing) is able to supply large power plants in view of their large consumption volume and of their requirements for high flexibility²⁴⁸ and security of supply.
- (632) The market investigation has shown that the new entity may discriminate against power plants: (i) by altering gas delivery conditions even without having to change the gas supply contracts, (ii) by increasing gas prices in July 2007 (iii) by altering gas delivery conditions in the context of a price renegotiation in 2007, (iv) by deteriorating gas supply conditions and prices at the expiry of the supply contracts and /or (v) by not offering more favourable gas supply conditions and prices on the open segment of the market.
- (633) As a direct supplier of gas-fired power plants supplied through the gas transmission network, MOL WMT has long-term gas supply agreements with those power plants. These contracts are generally long-term contracts (20 year duration for instance) that were established at the power plant construction. Therefore, the new entity is not able to unilaterally change the conditions of the contracts immediately after the merger.
- (634) As regards gas prices, at the moment, these supply contracts are public utility contracts subject to regulated prices, defined by governmental decrees. Therefore, the MOL WMT does not have the ability to increase prices under these contracts. However, as of July 1st 2007, it is expected that gas prices will be deregulated for all non residential customers. This means that the prices of public utility gas supply contracts will have to be renegotiated by the new entity and the power plants. Due to the lack of alternative supplier and the incipient stage of competition on the market for the supply of gas to power plants, the new entity will hence be able to increase gas supply prices to the power plants it will directly supply in 2007.

²⁴⁸ Because the operation of power plants depends on decisions by MVM, the single buyer, their gas consumption is extremely variable.

- (635) This risk of price increases has been highlighted by the market investigation. In particular, a third party has stated that:

“Although we have a long-term gas supply agreement with MOL WMT, the price is not defined in this contract, instead it contains a reference to the public utility prices set out in the applicable regulation. In 2007, when the market has to be fully opened, large customers will probably be forced on to the free market, and they will have to have a serious negotiation on prices with their gas supplier (the reference to public utility prices in the long-term gas supply agreement will not be relevant any more once the market is totally liberalized).”

- (636) Current prices paid by power plants for gas can also to some extent be renegotiated each year. As explained by a third party, gas prices do not always cover the entire gas quantities actually needed by power plants, leaving additional room for negotiation:

“Although the power plants have long-term contracts with MOL, their contracts only cover minimum quantities, and a new contract is signed each year to cover the needs of the coming year, in which the prices are renegotiated each time.”

- (637) As regards other supply conditions, no unilateral contractual changes are in principle possible before the contract expiry. However, following the merger, the new entity may have an influence over gas supply conditions in at least three ways.

- (638) First, the new entity could alter the gas supply conditions of power plants it directly supplies without any change in the contractual supply conditions. As explained in the gas section, the gas supplier may alter the power plants gas supply conditions in various ways. The vast majority of market players confirm the new entity’s ability to play with a broad range of supply conditions to discriminate power plants:

“E.ON can influence not only the pricing, but also the various conditions under which the plants take their gas in terms of minimum and maximum off take, balancing, nomination, cost of scheduling nominations (which is very important for “balancing” power plants)”

“E.ON/MOL can discriminate against its competitors not only through prices, but also by interrupting more competing power plants (even though the contracts with E.ON power plants and with competing power plants would formally provide for the same amount of firm and interruptible supplies), thereby forcing them to resort to alternative fuels and raising their costs. This behaviour cannot be regulated.”

“There are many possibilities for E.ON to discriminate between customers, not only as regards prices, but also as regards other important supply conditions such as gas nominations, penalties for breaching nominations, take-or-pay limits, interruption of gas supply, etc.”

“The gas supply to power plants can be influenced (legally and within the terms of the existing contracts) in such a way to support the energy market interests of E.ON and in a way that may damage the interests of non E.ON market players”.

- (639) As a concrete example (brought to the Commission’s attention by a power generator during the market investigation), in a scenario in which the new entity is contractually allowed to interrupt the gas supply to gas-fired power plants, the new

entity will have the possibility to arbitrarily decide to which power plant to interrupt supply, thereby increasing its cost of operation.

- (640) In their reply to the SO, the parties argue that “*possible interruptions of supply by MOL WMT to its customers would be contained and possibly penalized by the transmission operator*”.²⁴⁹ As evidenced by the market investigation, the Commission underlines that MOL WMT has the ability to foreclose gas-fired power plants in the various ways presented above in recitals 630 to 637, in particular as regards the interruptible gas supply to power plants.
- (641) It is worth noting that such behaviour (alteration of gas supply conditions) would not be costly for the new entity as it would not result in lower gas sales. As it would not be reflected in a contractual increase in gas prices, it would simply result in higher generation costs for these power generators and therefore lower margins as their electricity sales prices are fixed in the PPAs.
- (642) Second, the new entity could renegotiate part or all of the supply conditions in 2007 at the same time as the gas prices are renegotiated with power plants. The rules for setting the yearly, monthly and daily gas consumptions, their adjustment and the penalties for deviating for the fixed amounts also play an important role in a power plant’s gas supply contract and are relatively complex. The new entity would thus have the possibility to influence various parameters to reduce the competitiveness of its competitors’ gas-fired power plants: minimum and maximum yearly and monthly tolerance rate, maximum percentage of the yearly gas amount than can be nominated for one month, dates for providing gas nominations, penalties in case of over / under usage, rules for billing and payments, planning of maintenance operations, quantities of interruptible and uninterruptible gas, etc. The new entity could for instance impose higher penalties in case of non respect of the power plants’ daily gas nominations for instance or lower tolerance ranges for daily nominations
- (643) Finally, another way to discriminate power plants would be to offer more favourable gas supply contracts on the open segment of the market to certain gas-fired power plants. As large power plants are already eligible customers (although none of them has switched so far), they may change supplier and revert to the new entity as gas trader on the open segment of the market. Again, due to the absence of competition on the open segment of the gas market, power plants would not be able to switch to another market player on the open segment of the market.
- (644) The new entity’s ability to discriminate against the remaining power plants it does not supply directly with gas is more limited before 2007. While E.ON will not be in a position to modify the gas supply conditions to those power plants, it will still have the ability to discriminate amongst them by not offering them more favourable gas supply conditions and prices on the open segment of the market. As an example, E.ON may wish to offer more (or less) advantageous gas supply conditions to certain gas-fired power plants depending on their commercial relationships (or lack thereof) with E.ON electricity retail subsidiaries²⁵⁰.

²⁴⁹ Reply to the SO, Page 9.

²⁵⁰ E.ON’s incentives to engage in such input foreclosure / discrimination is discussed in sections d) and e) below.

d. E.ON plans to expand significantly its electricity generation capacities in Hungary

- (645) The essential change brought about by the transaction is that, contrary to MOL, E.ON has a strong presence in electricity retail in Hungary and has therefore a strategic interest in developing new electricity generation capacities.
- (646) The Commission's investigation has established that E.ON's strategy is to expand its electricity generation capacity with a view to balance its strong existing position in electricity retail. This point is essential as it constitutes the essential change brought about by the proposed transaction in the electricity sector and it modifies MOL WMT's set of incentives vis-à-vis existing and future gas-fired power plants.
- (647) As explained in recitals 150-151 and 599, due to the growth of domestic consumption and the closure of old power plants, a substantial part of the Hungarian electricity generation capacity will need to be renewed in the coming years. This large nation-wide need for additional generation capacity offers market players the opportunity to significantly increase their generation capacity in Hungary.
- (648) E.ON is strongly focused on the electricity markets at the European level and in particular in Central Europe.

*E.ON*²⁵¹: “[...]”.

*E.ON*²⁵²: “[...]”.

- (649) In Hungary, E.ON's currently generation capacity is limited but the company is the leading player at the wholesale and retail level. According to the market investigation, E.ON's current limited generation capacity in Hungary will develop significantly in the next years. Internal documents from E.ON [...] ²⁵³.

*E.ON*²⁵⁴: “[...]”.

- (650) The Commission's market investigation, based on data provided by MAVIR, the HEO and all major market players, has shown that E.ON was the only group planning to build large new power plants in Hungary in the next 5 years.
- (651) Based on the information available to the Commission, although E.ON's projects are at an early stage, the likelihood that the power plants will actually be built is very high. E.ON has already purchased two sites to build the new power plants ([...])^{*} and the projects have been extensively discussed within the group. Although new

power plant projects require a long time before commissioning, this will lead to an increase in E.ON's share of total and gas-fired power generation around [...]*

On the [...] project, E.ON²⁵⁵: “[...]”.

- (652) New power plants will play a decisive role on the Hungarian electricity markets as they are not obliged to sell the bulk of their electricity production to MVM under long-term PPAs. This means that the share E.ON will acquire in electricity generation capacity available for the wholesale supply of electricity to traders will be much more important than its share of the total national generation capacity.
- (653) Finally, due to its presence in neighbouring countries at the retail level, E.ON could seek to import competitive electricity into Hungary. Moreover, in view of its financial strength and its focus on Eastern European energy markets, E.ON is likely to further expand this position. Although the Commission acknowledges the apparent current lack of relationship between E.ON's owned companies in Eastern Europe, E.ON's position as a large vertically integrated company in the energy sector in several of Hungary's neighbouring countries provide the group with additional strengths in Hungary.
- (654) To conclude, through its new power plants and its role in electricity imports, E.ON will acquire a critical role on the open segment of the wholesale electricity market in Hungary, as it will own new and competitive gas-fired power plant available for the wholesale supply of electricity to traders (as opposed to other generators with capacity booked under the PPAs) and will be in a position to play a major role in electricity imports through its presence in neighbouring countries. In view of the combination of these strengths, even before the proposed transaction, E.ON is set to become a major player in the market for the wholesale supply of electricity to traders in Hungary.

e. The new entity will have the incentive to foreclose its competitors in electricity generation/wholesale

- (655) According to the Commission's assessment, the new entity is likely to engage in two types of foreclosure strategies to strengthen its position both in electricity generation / wholesale and retail supply in Hungary. The new entity has a substantial economic interest in carrying these foreclosure strategies against new or existing gas-fired power plants immediately after the transaction, either alternatively or simultaneously.
- (656) As regards new power plants, the new entity is likely to increase the total cost of gas to its competitors' new gas-fired power plants immediately after the transaction, with the aim to deter these rivals from building new gas-fired power plants and to favour its own new power plants projects²⁵⁶. This strategy would be attractive for E.ON's in view of its strong interest in expanding significantly its power generation capacity in Hungary.

²⁵⁵ E.ON's reply to the Commission request for information dated 18 July 2005. Binder Electricity, Reply to Question 122.

²⁵⁶ E.ON's focus and plans in new electricity generation capacities in Hungary is discussed in section d) above.

- (657) The new entity may also immediately after the transaction discriminate against new gas-fired power plants that do not supply its downstream electricity retail affiliates. This strategy would be economically rationale as it would provide the new entity a certain degree of control over the market for the wholesale supply of electricity to traders and additional competitive advantage on all electricity retail markets. The new entity's ability and incentive to carry out this strategy would increase with the progressive reduction of the scope of the PPAs.
- (658) The merger is therefore likely to limit the development of new electricity generation capacities in Hungary and to significantly impede effective competition on the market for the wholesale supply of electricity to traders. As explained below, the Commission stresses that this effect will materialize immediately after the transaction and will increase over time.
- (659) The following recitals will present the new entity's incentives to carry out these foreclosure strategies and discuss the likelihood and potential combination thereof in the current regulatory framework.

Foreclosure of access to gas

- (660) The new entity could first increase / threaten to increase the total cost of gas supply to its competitors' new gas-fired power plants through the various ways presented above in section c). The objective of such input foreclosure strategy would be to deter new gas-fired power plants projects from E.ON's competitors in Hungary.
- (661) In to favour its own plans to build new gas-fired power plants, E.ON would offer worse conditions of gas supply to its competitors planning to build new gas-fired power plants than to its own power plants. Considering the risk to be foreclosed for their gas supply, E.ON's competitors with plans to invest in new gas-fired power plants (accounting for the large majority of new power generation capacities), would most likely to abandon / delay their projects. This strategy would lead to a reduction / slow down of new generation capacity projects compared to the situation where E.ON's competitors would have also invested in new power plants and it would therefore strengthen E.ON's position as the major investor in new generation capacity in Hungary.
- (662) The new entity would not even need to actually carry out this strategy since the mere possibility that it will do so post-merger is sufficient to create a strong deterrence effect for E.ON's competitors.
- (663) In order to plan large investments, private companies evaluate the return / risk ratio and require a certain level of return on investment with limited risks. These requirements are all the more stringent (and difficult to evaluate) than the return on investment is planned to be achieved over a long period, as it is the case for power plants projects. The simple fact that E.ON will be at the same time the unique significant gas supplier and a major player on the electricity markets hence suffice to deteriorate the return / risk ratio (by increasing the risk level of the project) and as a consequence to limit non-E.ON investments in new power plants.
- (664) The cost of gas supply accounts for approximately 60-70% of gas-fired power plants operating costs and has therefore a major impact on their profitability. E.ON's

internal documents related to the heat and power plant in Nyíregyháza²⁵⁷ confirm that [...]*. E.ON estimates that the power plant modernization project has an Internal Return Rate (“IRR”) of [5-10]*%, which would decrease by [0-5]*% as a result of a hypothetical [5-15]*% increase in the price of gas. The sensitivity of a gas-fired power plant’s IRR on gas prices is obviously higher if the power plant does not produce heat.

(665) E.ON’s competitors planning to invest in new gas-fired power plants also evaluate the IRR of their projects, which may be largely influenced by E.ON’s gas supply policy. In view of these elements, the return / risk ratio of new gas-fired power plants projects is likely to fall below the threshold required by new electricity producers to invest in new generation capacity.

(666) All potentially affected competitors have expressed their serious concerns about the transaction. Some of them also compete with E.ON at the electricity retail supply level. The following are examples of concerns expressed by third parties:

“E.ON having privileged access to gas and capacities, it will obtain a competitive advantage over the other power generation companies. The merger may thus lead to discrimination of competitors on the Hungarian power market and may ultimately cause serious investment problems. (...) We strongly fear that the Parties will gain a considerable competitive advantage over our personal investment plans in electricity generation”.

“We are uncertain what gas prices E.ON will offer to its competitors and this is a potential risk for new power plants projects. As a consequence, the transaction creates significant uncertainties for non-E.ON market players and deters new gas-fired power plant projects.”

“As we don’t see any new interconnection project on the medium term, locally, there will be no investments in power plants because no private investor will take the risk to be downstream under E.ON gas monopoly which, in the same time, is its electricity competitor. In the medium run, it will increase electricity price.”

(667) Based on its knowledge of the energy sector and its contacts with market players in the electricity sector, the HEO’s assessment confirms these concerns²⁵⁸:

“It is possible that in the case of E.ON dominating the natural gas sector supply side, power plant investors under different ownership will abandon their plans to build natural gas fuelled power plants (...). If electricity generation investors withdraw from creating new capacity - as they have already indicated in advance - E.ON may appear as a dominant power plant investor”

(668) The HEO also reported to the Commission that *“Several investors are hesitating to build new gas-fired power plants.”*²⁵⁹

²⁵⁷ E.ON’s reply to the Commission’s request for information of 18 July 2005. Binder Supplement 2, Reply to Question 121. “Errichtung eines GuD-Heizwerk in Nyíregyháza (Ungarn)”, 16 June 2005.

²⁵⁸ “Answers to the questions raised by the GVH related to the Share Transfer Transaction between E.ON and MOL” - HEO

- (669) The deterring effect on new gas-fired power generation would have a significant impact on the development of new generation capacity in Hungary. It should be recalled that, according to the Commission's market investigation, approximately [1,000-1,500] MW of gas-fired generation capacity is expected to be added / renewed until 2010 by several market players, accounting for the very large majority of new power plants projects in Hungary. Based on the concerns expressed by several market participants and its own assessment, the Commission estimates that the proposed transaction significantly puts at risk those projects. Furthermore, as discussed above²⁶⁰, alternative fuels are less competitive than gas for new power plants to be built in Hungary and electricity producers would thus not be in a position to build non gas-fired power plants to counter the new entity's strategy to foreclose access to gas.
- (670) In their reply to the SO and the accompanying Expert Report, the parties however claim that the new entity has no incentive to impede the development of new gas-fired power plant and, on the contrary, has rather an interest in supporting their development to increase its gas sales²⁶¹.
- (671) The Commission acknowledges that the new entity, as a supplier of gas, has an obvious interest in increasing its gas sales over the long term. Deterring investments in new electricity generation capacities will therefore have a cost for the new entity if its results in less new gas-fired power plants in Hungary. The Commission however estimates that the new entity is likely to incur this cost in view of the substantial additional profit that this strategy would bring to the new entity in the electricity wholesale and retail markets, where it would strongly strengthen the new entity's market position. The new entity would also in any case revise and increase its own new power generation plans in order to partly replace the new power generation projects abandoned by its rivals.
- (672) Finally, the foreclosure strategy may be combined with a "tolling strategy", whereby the new entity would only partially limit the development of new generation capacity by its competitors but would supply gas under competitive conditions only to the power plants that supply its electricity retail subsidiaries. This approach would effectively limit the new entity's "lost gas sales" to future gas-fired power plants. It would also enable the new entity to increase its share in new power generation projects, to limit its competitors' gas-fired power plants market power and to ensure competitive electricity supply to the new entity's electricity retail subsidiaries.

Tolling agreements

- (673) During the market investigation, several market players expressed the concern that E.ON could provide competitive gas supply conditions only to the power plants that would sell electricity to E.ON's USPs and electricity traders ("friend" power plants):

²⁵⁹ Minutes of meeting with HEO on 26 July 2005.

²⁶⁰ See section a) on the Limited potential for non gas-fired power plants.

²⁶¹ Reply to the SO, Page 23

Enpol2000²⁶²: “The transaction will have an effect on the electricity markets even if E.ON has a small presence in generation since E.ON may connect its gas supply contracts with its electricity purchase contracts”

Other third parties have expressed similar concerns, as reflected in the following statements: *“One of the main threats of the merger is that E.ON will award advantageous gas contracts to its own power plants or to the power plants that are not related to a company with supply activities.”*

“Although E.ON does not have large electricity generation capacities itself, it could grant more favourable natural gas supply conditions to the power plants that supply E.ON and its subsidiaries with electricity and discriminate against the power plants supplying other traders than E.ON.”

“Following the merger, E.ON will have the opportunity to favour itself as trader on the electricity wholesale market and its RDCs on the electricity retail market. Secondly, E.ON/MOL may sell gas at better conditions to power generators on the conditions that they supply its RDCs at better prices (and thus would gain an advantage over its competitors).”

- (674) The Commission takes the view that the new entity will have an economic interest, (and is therefore likely to) adopt this discriminatory behaviour immediately after the transaction. This strategy could be implemented for new gas-fired plants in various ways: (i) tacit understanding between the new entity and the power generators, (ii) explicit link between gas supply and electricity purchase contracts and (iii) “tolling agreement”, where the conversion of gas into power is simply “outsourced” by the new entity.
- (675) The objectives of such gas foreclosure strategy vis-à-vis new power plants would be twofold: (i) to gain a significant control over the development of new generation capacity and (ii) to secure competitive electricity supply for the new entity’s electricity retail subsidiaries. The new entity would also seek to prevent the cost of lost gas sales to new gas-fired power plants as the reduction in total new generation capacity addition would be more limited than in the previous foreclosure scenario. Such strategy would in addition provide E.ON with more flexibility as regards the level of its own investment in new generation capacity and the investment risk will be shared to some extent with other electricity producers. E.ON could therefore decide which amount of new generation capacity it wants to build in Hungary and establish tolling arrangements for the additional increase in generation capacity.
- (676) The new entity will have the choice of various contractual arrangements to achieve this objective. The first solution would consist in maintaining the link between the gas supply and the electricity purchase conditions tacit and absent from the two supply contracts (which constitute anyway business secrets). In a second solution, the two supply contracts could be linked and the electricity supply contract could mention the price of gas set in the gas supply contract or other supply conditions thereof. Finally, in a third solution, the new entity could also present it as the outsourcing of the electricity generation process in its integrated activities along the

²⁶² Energiapolitika 2000’s reply dated 28 July 2005 on the Commission’s second phase questionnaire. Energiapolitika 2000 is a group of independent energy experts in Hungary.

gas and supply chain. The competitor's power plant would be supplied with gas and would sell electricity under conditions defined by the new entity against a fee based on the reserved capacity or the quantity produced. Given the wide array of potential contractual arrangements, the Commission estimates that the new entity would be in a position to select the most advantageous way and in particular the procedure the less likely to give rise to complaints or legal concerns.

- (677) The parties contest the new entity's ability to carry out these two foreclosure strategies. They first argue that competitors planning to build new gas-fired power plants would revert to alternative gas suppliers should they be confronted to such foreclosure strategies from the new entity. The Expert Report submitted by the parties also argues that Gazprom could sell gas directly to E.ON's competitors in power generation²⁶³.
- (678) The Commission refers to its assessment of the new entity's control over all gas resources available in Hungary and on its current dominant position on the market for the supply of gas to power plants, which clearly contradicts the parties' arguments. All major market players in electricity generation reported to the Commission their inability to find alternative gas suppliers to MOL WMT. It should be recalled that, as of December 2005, the only suppliers of gas to power plants are MOL WMT (market share in excess of 65%) and the gas RDCs, sourcing gas from the latter and that neither EMFESZ nor CENTREX (nor other traders) supply power plants in Hungary.
- (679) With respect to Gazprom, the Commission notes that Gazprom has never engaged in the direct supply of gas to power plants (nor in any other gas supply activities), in competition with its gas wholesale customers. Although Gazprom has already publicly stated its interest in being active in the Hungarian gas supply markets, it is not expected to enter the market on its own but through acquisition of stakes in existing businesses or assets.
- (680) The parties also claim that the manipulation of gas supplies would be easily identified by the regulator²⁶⁴ and that the new entity would therefore be deterred from carrying out this strategy. The Commission disagrees with the parties on this point as gas supply contracts with power plants constitute business secrets and are not available to third parties or to the HEO. Therefore, the Commission believes that it is actually very difficult for power generators to detect whether they are foreclosed for their gas supply or to complain to the HEO with a sufficient degree of confidence (see comments in the gas section). In view of the specificity of power plants' gas supply needs, it would anyway be difficult to establish that differences in gas supply prices between two power plants result directly from a discriminatory behaviour rather than from differing gas supply conditions. In addition, neither Directive 2003/55/EC nor the HGA explicitly prohibit discrimination in gas supply²⁶⁵.

²⁶³ Expert Report, Page 4.

²⁶⁴ Expert Report, Page 21/22

²⁶⁵ Such discrimination could be prohibited by the provision of the European Community Treaty on abuse of dominant position (Article 82).

Existing power plants

- (681) The Commission that the new entity may also carry out the above-described foreclosure strategies against existing gas-fired power plants immediately after the transaction, with a view to marginalize existing gas-fired power plants and eventually induce some power producers to exit the market.
- (682) The new entity may seek to marginalize existing gas-fired power plants to ultimately acquire the assets of exiting players. E.ON's interest in acquiring existing gas-fired power plant has been confirmed by the market investigation. For instance, a third party has stated that E.ON has started negotiations to acquire privately owned existing power plants:
- “In addition, E.ON may be able to overtake easily one of the private electricity generators (according to this third party there would be currently negotiations with Dunamenti, AES and ATEL; EDF is also currently negotiating the sale of its Budapest plant).”*
- (683) [...] discussed in E.ON's internal documents. In the presentation “New Energy for Central Europe”²⁶⁶, “[...]” are discussed, in particular “[...]”.
- (684) To conclude, the Commission considers that, post-merger, the new entity has strong incentives to increase the total cost of gas supply to its competitors' new and existing gas-fired power plants or to supply competitive gas to those power plants only under the condition that they supply E.ON's electricity retail subsidiaries with competitive electricity supplies. These strategies would result immediately after the transaction in deterring new entries in electricity generation and restricting competitors' gas-fired power plant's ability to obtain competitive gas supply.
- (685) For these reasons, the Commission considers that the merger will increase the new entity's market power and will already significantly impede effective competition on the market for the wholesale supply of electricity to traders under the current market conditions.

f. The new entity's incentives to foreclose its competitors in electricity generation/wholesale will increase with the further liberalization of the electricity sector and the increase in E.ON's generation capacity

- (686) The Commission believes that the new entity's incentives to foreclose its competitors' gas-fired power plants and to implement a “tolling strategy” will increase in the future regulatory framework due to the conjunction of three factors: (i) the increase in E.ON's generation capacity, (ii) the progress in the liberalization of the gas and electricity sectors and the (iii) progressive reduction in the scope of the long term PPAs in Hungary. These three factors imply that the total cost of the gas supply will become even more crucial for gas-fired power plants to compete on the market for the wholesale supply of electricity to traders.

²⁶⁶ E.ON's reply to the Commission's request for information dated 18 July 2005. Binder Supplement I – Presentation « E.ON Energie – Capital Market Day – Munich, September 6, 2004 ».

- (687) The increase in E.ON's generation capacity has already been discussed above in section d). It is expected to start in [...]*, except if E.ON speeds up its existing power plant projects or acquires existing power plants before that date.
- (688) The greater E.ON's share in gas-fired generation capacity in Hungary is, the greater are the group's incentives to foreclose its competitors' gas-fired power plants. An increase in the share of gas-fired generation capacity both increases the benefits resulting for higher electricity sales and decreases the cost of lost gas sales for the new entity.
- (689) The new step in the gas and electricity market liberalization in Hungary in July 2007 will also create additional opportunities and strengthen the new entity's ability and incentives to engage in foreclosure behaviours.
- (690) The end of regulated gas prices for power plants will allow the new entity to increase contractual gas prices to its competitors' gas-fired power plants (and possibly to deteriorate gas-fired power plants' gas supply conditions). At the same time, the end of electricity regulated prices for non residential end-users and the eligibility of residential customers should increase competition among electricity traders on all electricity markets and their interest in procuring electricity at the lowest price.
- (691) The potential renegotiation or even termination of the PPAs has also been discussed previously in this document. While the scope and the timing of these changes is still unclear, it may be assumed for the purpose of this assessment – as this is a very likely development - that their duration and the booked capacities may be progressively reduced. In any case, the proportion of generation capacity available for the wholesale supply of electricity to traders will necessarily increase as newly built power plants' capacities are generally not bound by long term PPAs.
- (692) In this regulatory framework, gas-fired power plants will compete on the market for the supply of electricity to traders and the total cost of the gas supply will be a crucial competitive factor. The market investigation has also indicated that competition is largely price-driven for electricity wholesale and that gas-fired power plants have similar technologies in Hungary, and thus similar cost structure.
- (693) Finally, the scope of the PPAs for the non gas-fired power plants, in particular the nuclear power plant, is less likely to be reduced , resulting in increased competition between gas-fired power plants on the market for the wholesale supply of electricity to traders. As indicated by the HEO, one of the essential objectives set by the Hungarian government for the New Electricity Model is to preserve the security of supply and the affordability of electricity supply for residential customers. In this respect, the government may decide to preserve cheap electricity generation resources for MVM for resale to USP and residential customers.
- (694) Moreover, in this future regulatory framework, a significant part of electricity wholesale will be achieved through bilateral transaction (“OTC”) between power plants (to the extent of their capacity available on the open segment of the market) and electricity traders. The news entity may therefore not only favour itself as an electricity trader but also replicate this mechanism with its competitors' gas-fired power plants and implement in a larger scale the “tolling strategy” described above. This concern has been expressed by several market players in the electricity sector:

“Such discrimination would be more accentuated once the “single buyer” framework ends after 2007 and once E.ON has built additional power generation capacities.”

“As soon as this system (“single buyer” scheme) disappears (according to the last draft of the Hungarian Electricity Act issued by the Hungarian regulator in June 2005), E.ON will be in a favourable position to provide cheap gas either to its own power plants (existing + [...]) project) or to contract with existing power plants with low gas price in order to buy cheap electricity for its own needs to supply their electricity RDCs.”*

- (695) This strategy would benefit E.ON to the detriment of its competitors in two ways as it would strengthen its position both at the power generation level and at the retail supply level. First, gas-fired power plants that would not benefit from advantageous gas supply conditions (“non friend” power plants) would become less competitive on the market for the wholesale supply of electricity to traders. These power plants would become marginalized thereby inducing them to eventually exit the power generation activity.
- (696) Secondly, USPs and electricity traders that would not have the ability to source electricity from gas-fired power plants supplied by the new entity under competitive conditions would have a significant competitive disadvantage vis-à-vis E.ON’s electricity retail subsidiaries and would have to rely on other less competitive gas-fired power plants and other electricity sources²⁶⁷.
- (697) To conclude, the Commission considers that E.ON’s ability and incentives to engage in the above-described foreclosure strategies will increase in the future liberalized regulatory framework. The significant impediment to competition on the market for the wholesale supply of electricity to traders will therefore become more severe in the long term, when the immediate “dampening effect” of the transaction on new generation capacities will materialize.

²⁶⁷ This strategy will not imply significant costs for E.ON as the electricity production lost by “non-friend” power plants being captured by E.ON’s or “friends” power plants.

(iii) *Electricity retail*

- (698) The impediment to the development of new power generation in Hungary and the impediment to competition on the market for the wholesale supply of electricity to traders would lead to price increases in electricity wholesale and retail and would limit E.ON's rivals ability to procure competitive electricity.
- (699) In addition, the Commission estimates that the proposed transaction will provide the new entity with the ability and incentive to prevent its competitors from developing dual offers²⁶⁸, which are expected to play a significant role in electricity retail markets. This would further contribute to increase E.ON's market power and would significantly impede effective competition on all electricity retail markets.
- (700) The following recitals will first present the structure of electricity retail in Hungary. The impact of the various foreclosure strategies at the level of electricity generation / wholesale on competition in the electricity retail markets and the new entity's ability and incentives to prevent its electricity retail competitors from developing dual offers will be analysed. The Commission's assessment has been carried out both in the current and in the future regulatory framework.

a. Market structure

- (701) Both RDCs (public utility segment) and traders (open segment) are active in the markets for the retail supply of electricity. As regards the various categories of customers, MLCs are supplied both by RDCs and traders; SCs are supplied essentially through RDCs and residential customers are only supplied through RDCs.
- (702) E.ON is active in the retail supply of electricity both in the public utility segment, through its three RDCs and in the open segment, through E.ON EK.

RDCs

- (703) The table below provides the sales of RDCs in each of the relevant product market for the retail supply of electricity²⁶⁹. While the figures reflect market shares for residential customers and SCs, sales of traders to MLCs are not taken into account and RDCs' actual market share are thus lower than those indicated in the table. It should be noted that E.ON's actual market share for the supply of electricity to MLCs should be approximately the same as the one estimated in the table below, in view of E.ON's strong position as electricity trader.

²⁶⁸ Dual offers combine the retail supply of gas and electricity in one « package » with clear advantages for customers such as « one stop shop » service (e.g. single billing).

Suppliers	Supply of electricity to residential customers in 2004		Supply of electricity to small commercial and industrial customers in 2004		Supply of electricity to medium and large commercial and industrial customers in 2004	
	In GWh	In %	In GWh	In %	In GWh	In %
ÉDÁSZ	[1000-2000]*	[15-20%]	[1000-2000]*	[15-20%]	[2000-3000]*	[20-25%]
DÉDÁSZ	[1000-2000]*	[10-15%]	[0-1000]*	[10-15%]	[0-1000]*	[5-10%]
TITÁSZ	[1000-2000]*	[10-15%]	[1000-2000]*	[15-20%]	[0-1000]*	[5-10%]
Total E.ON	[4000-5000]*	[45-50%]	[3000-4000]*	[50-55%]	[3000-4000]*	[30-40%]
ÉMÁSZ	[1000-2000]	[10-20%]	[0-1000]	[10-20%]	[1000-2000]	[10-20%]
ELMŰ	[3000-4000]	[20-30%]	[1000-2000]	[20-30%]	[3000-4000]	[30-40%]
DÉMÁSZ	[1000-2000]	[10-20%]	[0-1000]	[0-10%]	[1000-2000]	[10-20%]
Total Market	[10000-12500]	100%	[5000-7500]	100%	[7500-10000]	100%

Electricity traders

(704) Electricity customers that have switched to the open segment of the market are supplied by electricity traders. The main electricity traders active on the Hungarian market in 2003 and 2004 were:

Name	Group	2003 (GWh)	2004 (GWh)	% (2004)
Entrade	ATEL	[0-1000]	[1000-2000]	[10-20%]
ATEL Energia	ATEL	[0-1000]	[1000-2000]	[10-20%]
Total ATEL	ATEL	[1000-2000]	[3000-4000]	[20-30%]
MVM Partner	MVM	[1,000-2,000]	[2000-3000]	[20-30%]
E.ON EK	E.ON	[1000-2000]*	[2000-3000]*	[20-30%]
MÁSZ	RWE	[0-1000]	[1000-2000]	[0-10%]
System Consulting		[0-1000]	[0-1000]	[0-10%]
Sempre Energy Europe	Sempre Trading	[0-500]	[0-500]	[0-10%]
D-Energia	EDF	[0-500]	[0-500]	[0-10%]
Energy Financing Team	Energy Financing Team	[0-500]	[0-500]	[0-10%]
Others		[0-500]	[0-500]	[0-10%]
TOTAL		[5000-10000]	[10000-15000]	100%

(705) Electricity sales figures in the table above include both sales to traders and sales to final customers²⁷⁰. Total sales thus represent the total volume of electricity supplied by traders in Hungary and do not correspond to the total consumption of electricity end users that have switched to the open segment of the market.

(706) Based on the above, E.ON is clearly the leading player in the retail supply of electricity in Hungary and is the only group with strong positions both in the regulated and the open segments of those markets.

b. The new entity's strategies in electricity generation and wholesale would significantly impede effective competition in all the markets for the retail supply of electricity

(707) The deterring effect on new generation capacities and the impediment to competition brought about by the transaction on the market for the wholesale supply of electricity to traders would directly affect competition on all electricity retail markets. The proposed transaction would thus lead to higher prices on all electricity retail markets.

(708) In addition, the new entity's "tolling strategy" as regards competitors' gas-fired power plants would directly restrict E.ON's competitors' ability to compete effectively and increase E.ON's market power on all electricity retail markets.

(709) The Commission's projections on generation capacities available for the wholesale supply of electricity to traders indicate that E.ON could account for a substantial share of these capacities in 2010-2015. It should be stressed that these projections do not take into account the impact of the foreclosure strategies described above, which would deter new entries and favour E.ON's new power plants projects.

(710) The Commission estimates that the electricity generation capacities available on open segment of the wholesale market in 2010-2015 will reach approximately [4,000-5,000] MW. Gas-fired power plants will account for around [60-75%] of these capacities and E.ON for around 25%. The new entity's foreclosure strategies would therefore have an impact on at least 60% of total generation capacities available in Hungary for the wholesale supply of electricity to traders.

(711) In the reply to the SO, the parties argue that such strategies would be unsuccessful as "*electricity wholesalers and retailers have abundant alternative in buying electricity*"²⁷¹. They further identify the following four electricity sources: (i) nuclear power, (ii) coal-fired power plants, (iii) other gas-fired power plants and (iv) imports ("*for which sufficient interconnection capacity is available*"). The Expert Report also mentions²⁷² the "*ability of electricity retail competitors to obtain electricity supplies from non gas-fired power sources at competitive rates*".

(712) The Commission acknowledges the existence of alternative electricity sources in Hungary, in particular those listed by the parties. However, each of these sources is

²⁷⁰ There is no breakdown of electricity traders' sales according to the various categories of customers.

²⁷¹ Reply to the SO, Page 24.

²⁷² Expert Report, Page 26.

subject to major limitations, be it in terms of price-competitiveness, availability or flexibility. Procurement from non-gas-fired power plant may prove difficult as a large share of the cheapest power plants' capacity (nuclear and lignite) may not be available on the free market while coal power plants have much higher generation costs. This would be all the more difficult for peak-load electricity which in any event, cannot be procured from the nuclear and the lignite power plants.

- (713) The scope of the PPA is not expected be reduced for the nuclear power plant (and potentially the lignite power plant) and the electricity produced by this power plant is therefore not expected to be available on the open segment for the market. As indicated by the HEO, one of the essential objectives set by the Hungarian government for the New Electricity Model is to preserve the security of supply and the affordability of electricity supply for residential customers. In this respect, the government may decide to preserve cheap electricity generation resources for MVM for resale to USPs and residential customers. Other market players confirmed this view:

“The nuclear power plant will be operated as a national company at a regulated cost for the benefit of residential customers in Hungary.”

- (714) According to the market investigation, the nuclear power plant's electricity production may be reserved for the USPs, which will take over the public service functions of the RDCs. The USP could purchase this competitive electricity to the extent of the quantities they supply to small customers at low regulated tariffs. In 2004, the quantity of electricity produced by the Paksi nuclear power plant ([10-12.5] TWh) was approximately the same as the quantity of electricity consumed by Hungarian households ([10-12.5] TWh).
- (715) In addition, the nuclear power plant and the lignite power plant ([2,500-3,000] MW capacity together) are essentially used for base-load electricity in Hungary, while gas-fired power plants are both used for base-load and peak demand due to their ranking in the national merit order²⁷³. Electricity retailers are therefore not able to revert to those power plants to match the fluctuations of demand or to satisfy a peak in demand.
- (716) The Commission notes that the Expert Report submitted by the parties also excludes the nuclear power plants to calculate the non gas-fired power capacity in Hungary as²⁷⁴ *“it sells directly onto the public utility market”*.
- (717) As regards electricity imports, the market investigation has clearly shown that interconnectors with countries where electricity is competitive are already congested, which strongly limits the possibilities to increase electricity imports into Hungary. In addition, according to MAVIR projections, net Hungarian electricity imports are expected to decrease in the next five years due to lower availability of electricity generation capacities in neighbouring countries. Through its extensive

²⁷³ See section V.B.(i).e on Electricity generation in Hungary for a graphic representation of the Hungarian power plants' merit curve.

²⁷⁴ Expert Report, Page 26

presence in Hungary's neighbouring countries in electricity retail, in particular in Slovakia, E.ON would anyway play a significant role in electricity imports.

Expected evolution of Hungarian electricity net imports:

Source: MAVIR presentation, May 2005

(718) To conclude, the Commission considers that E.ON will have the ability and incentive to restrict its competitors' ability to obtain competitive electricity supplies and to distort competition on all electricity retail markets. For those reasons, the Commission considers that the merger would increase E.ON's market power on all the electricity retail supply markets in Hungary and would significantly in a substantial part of the common market within the meaning of Article 2 of the Merger Regulation.

c. The new entity will have the ability and incentive to foreclose access to gas to its electricity retail competitors

(719) The Commission's market investigation has also revealed that access to gas resources is also crucial for electricity retail activities as dual offers are expected to play an important role in electricity retail markets. Following the transaction, the new entity will be in a position to foreclose access to gas to its electricity retail competitors with the objective to prevent them from developing dual offers²⁷⁵. The new entity will have an economic interest in denying access to competitive gas to its competitors in order to retain its current gas and electricity customers and to acquire new customers.

²⁷⁵ "Dual offers are a good opportunity, but at present there are no accessible gas resources for electricity traders to get into the gas trading business."

"Although [we] could also team up with gas resellers (RDCs for instance), [we] could certainly not obtain gas in very competitive conditions. This gas would anyway be sourced from E.ON"

(720) In their reply to the SO, the parties state that “*whether dual offers will become important in the Hungarian gas market is a matter of pure speculation*” and allege that “*third parties have not expressed any more clear views than to say that dual offers might be possible in the future*”²⁷⁶. These statements do not reflect the result of the market investigation and the assessment carried out by the Commission.

(721) First, most of the respondents to the market investigation in the present case (both electricity and gas suppliers and customers) reported to the Commission that dual offers will play a significant role on the Hungarian energy retail markets. Although some large industrial customers concurred with this statement in their reply to the Commission, most market players indicated that this type of offer would be more attractive for residential customers and small industrial and commercial customers (together “small customers”). These small customers do not devote a large part of their budget to gas and electricity and do not make much effort to compare the offers from various suppliers (in countries where they may do so). From their view point, having only one bill (this also valid for IT services providers for instance or banks and insurance, etc.) is quite convenient and “makes life easier”.

(722) The following are statements by third parties as regards the future importance of dual offers:

“The main advantages of a dual offer, from the client’s perspective, are its simplicity (one bill, one call centre, etc.), the benefits of a customized commercial approach, the access to a unique qualified interlocutor and through him to advices and energy services and the impression of saving money”

“The electricity-gas (multi-utility) offers may become widespread after the full market opening (while the efficiency gains in the supply of the residential customers may become possible).”

“Dual offers could be very competitive at the retail market, especially if the service provider caters for energy efficiency, optimization, scheduling issues as well.”

(723) Dual offers also represent significant advantages for gas and electricity suppliers. For incumbent operators, dual offers are a tool to limit customer switching by offering new services meeting customers’ expectations and enhancing customers’ commercial relationship. Dual offers also enable suppliers to enter into new energy markets and to benefit from economies of scale (purchasing, infrastructures, commercial network, etc.).

(724) Second, some respondents to the market investigation have pointed out examples of dual offers in other European countries, which have proved to be relatively successful. Dual offers have already been developed in the United Kingdom, in Spain and in Germany by energy suppliers and are currently advertised in France²⁷⁷.

²⁷⁶ Reply to the SO, Page 25.

²⁷⁷ See:

http://ecx.gazdefrance.fr/ecx/redirect.jsp?repertoire=/Espace_Entreprises/Offre_Elec/offre_elec_professionnel_s&caller_a_webc_url=temp_EEN/accueil_professionnel.htm

<http://www.edfpro.fr/61033i/Accueilfr/EDFPro/Offres/GammeProenergies/EssentielProenergies.html>

As an example, Centrica in the United Kingdom, a historical gas operator, entered the electricity market by introducing dual offers for all customers segments and has gained a significant share of the United Kingdom electricity retail market.

- (725) The various acquisitions involving companies active both at the gas and electricity retail level show that there is a convergence of the gas and electricity retail markets in Europe. This trend is even [...] strategy by [...]*:

*E.ON*²⁷⁸: “[...]”

- (726) Third, according to a survey conducted by a market player among its residential customers in Hungary, [50-100%] of the clients would be interested in dual fuel offers and they would expect such offers from their local energy supplier. The Commission notes that this result indicate without any doubt that dual offers are likely to play an important (if not essential) role, in Hungary’s gas and electricity retail markets.
- (727) In view of its dominance on the markets for the supply of gas to RDCs and to traders and the interest of small customers in dual offers, the Commission believes that the merged entity will have the ability and the incentive to foreclose access to gas resources for its downstream competitors in the markets for the retail supply of electricity to SCs and residential customers, thereby increasing its market power on these markets. As a result, effective competition would be significantly impeded in a substantial part of the common market within the meaning of Article 2 of the Merger Regulation.
- (728) Although the parties have not raised any specific argument with respect to the impact of the regulatory situation on the competitive assessment²⁷⁹, the Commission has carefully considered whether the fact that residential customers will only become eligible in July 2007, and thus the market for the supply of electricity to residential customers is not open on the date of the decision, could, by itself, dispel the concern that the merger will significantly impede effective competition within the meaning of Article 2(3) of the Merger Regulation. For the same reasons as those developed as regards the market for the supply of gas to residential customers, the Commission has concluded that the transaction is likely to have immediate effects on the market for the retail supply of electricity to residential customers by restricting the ability of potential suppliers to compete with the new entity on neighbouring markets and thus further discouraging potential entries.

Conclusion on the impact of the proposed transaction in the electricity sector

- (729) In view of the merged entity’s near monopoly in the access to competitive gas resources and its strategic focus on building new power generation capacities, the merged entity will have, already in the current regulatory scenario and at the current stage of market liberalisation, the ability and the incentive to foreclose access to gas to its competitors’ new gas-fired power plants and /or to discriminate in its supply to

²⁷⁸ E.ON’s reply to the Commission’s request for information dated 18 July 2005. Binder Supplement I. Presentation « E.ON Energie – Capital Market Day – Munich September 6, 2004 ».

²⁷⁹ It is not argued, in particular, that the Commission is not entitled to assess the effects of the merger on that market, due to be opened to competition shortly.

competitors' new gas-fired power plants, thereby deterring competition from any of its rivals as regards the foreseen replacement and expansion of generation capacity in Hungary.

- (730) E.ON's strategy would lead to a slower and less competitive development of new generation capacity in Hungary starting immediately after the transaction (compared to a situation where several market players would have built new power plants) and ultimately lead to higher electricity wholesale prices. It would thus impede effective competition on the market for the wholesale supply of electricity to traders.
- (731) In the future liberalized regulatory framework characterized by a larger share of power generation capacities available on the open segment of the market (new power plants and potential renegotiation of the existing PPAs) and by E.ON's larger share in power generation (resulting from E.ON's current capacity extension projects and the foreclosure strategy described above), the above described foreclosure strategies will be all the more effective and therefore damaging. They would reduce E.ON's competitors' gas-fired power plants' ability to compete and limit the scope for the development of a competitive open segment of the electricity wholesale market.
- (732) This would have a direct impact on competition in all the markets for the retail supply of electricity, due to the restriction in new generation capacity and higher wholesale prices. As a result of the strategy to link the gas supply and electricity purchase of gas-fired power plants, the new entity would reduce its electricity retail competitors' ability to source competitive electricity and would increase its already strong market power in electricity retail, thereby significantly impeding competition on all electricity retail markets.
- (733) Finally, immediately after the transaction, E.ON will have the ability and incentive to prevent any other company active in electricity retail from developing dual offers (gas and electricity) by foreclosing access to gas resources to those competitors willing to pursue this marketing strategy, thereby significantly impeding competition on the markets for the supply of electricity to SCs and residential customers.

VII. ASSESSMENT OF THE REMEDIES PROPOSED BY THE PARTIES

(734) In order to remove the competition concerns described above in section VI on the gas and electricity markets, on 20 October 2005 E.ON submitted a package of commitments. On 15 November 2005, following the market test, E.ON submitted revised commitments. E.ON submitted final commitments on 8 December 2005. The commitments are set out in the Annex. The recitals below describe the main features of the commitments, as submitted by the parties and modified/improved following the results and the suggestions of the market test.

A. Description of the remedies

(i) Ownership unbundling

(735) Under the agreements concluded between MOL and E.ON, MOL would remain a minority shareholder in MOL WMT and MOL Storage (25% + 1 share in each) and enjoy a 5-year put option under which it can require E.ON to purchase these minority interests.

(736) Pursuant to the undertakings, MOL will divest its remaining shareholdings of 25% + 1 share in MOL Storage and MOL WMT within six months following the transaction. The buyer of the shares will be subject to the Commission's approval. In addition, MOL will not acquire direct or indirect minority stakes in MOL WMT and MOL Storage for a period of 10 years as long as E.ON is a majority shareholder of those companies.

(737) The objective of the ownership unbundling remedy is to alleviate the competition concerns raised by the Commission as regards MOL's incentives (in particular through its subsidiary MOL Transmission and its branch MOL E&P) to favour MOL WMT (for access to the transmission network) and MOL Storage (for access to future storage sites).

(ii) Put option related to MOL Transmission

(738) Under the agreements concluded between MOL and E.ON, MOL would be granted a 2-year put option under which it can require E.ON to purchase a 25% + 1 share or a 75% - 1 share interest in MOL Transmission.

(739) Pursuant to the undertakings, MOL will not exercise the put option for the 25% + 1 share interest in MOL Transmission. In addition, MOL will not sell to E.ON or any of its affiliates, for a period of 10 years as long as E.ON is a majority shareholder of MOL WMT and MOL Storage, a share interest in MOL Transmission that would not result in the acquisition of sole control over MOL Transmission by E.ON or of joint control over MOL Transmission by E.ON and MOL.

(740) The objective of the undertaking related to the put option for MOL Transmission is to ensure that any acquisition of a share interest in MOL Transmission by E.ON will be subject to merger control review by the relevant competition authority.

(iii) Gas Release Programme

(741) E.ON undertakes to implement a gas release programme in Hungary by way of business-to-business internet auctions. The programme will start in 2006 and have a duration of 8 years. Auctions will be held in 2006, 2007, 2008, 2009, 2010, 2011, 2012 and 2013. The necessity of continuing the programme for the last three years can be reassessed upon request by the parties at the end of 2010. 1 billion m³ of gas will be released at each annual auction. The annual quantities to be released will be divided in 5 lots of 100 million m³, 5 lots of 50 million m³ and 10 lots of 25 million m³ each. E.ON's affiliates will be excluded from participating, directly or indirectly, in the auctions.

(742) The successful bidders will enter into gas supply contracts with E.ON under the following terms and conditions. The contracted gas will be equally split over two years and delivered at the two Hungarian entry points (80% at the Eastern entry point and 20% at the Western entry point). The gas supply contracts will provide for the same flexibility as MOL WMT's upstream gas supply contracts, namely an annual flexibility of 85% to the effect that the purchaser will have to purchase and pay only 85% of the annually contracted gas quantity ("TOP obligation"). In addition, the daily and quarterly flexibility shall not be lower than the weighted average daily and quarterly flexibility of all purchase contracts of MOL WMT. In any event, the daily flexibility shall be at least 50% of the daily contracted quantity.

(743) The auctions will be carried out by an international IT service provider, and the auction procedure will be handled so as to ensure that MOL WMT does not gain knowledge of the intermediary bids placed by participants to the auction.

(744) The starting price for each annual auction will be 95% of the weighted average cost of gas of MOL WMT ("WACOG"). The calculation of the WACOG will be verified by the HEO. Quantities that are not sold in a given auction shall be reoffered with one third of the quantities each in the following three auctions, but no auction for unsold quantities will take place after 2014.

(745) The Hungarian Energy Office (HEO) and a Monitoring Trustee will supervise the auctions and the implementation of the gas release programme. In particular, the HEO will comment on and review E.ON's proposal for the technical implementation of the auction and the details of the supply contracts with the successful bidders, before it is submitted to the Commission for its approval.

(746) In addition, E.ON undertakes to grant the existing direct customers of MOL WMT and E.ON (KÖGÁZ and DDGÁZ) who participate in the auction or who purchase gas from a trader/wholesaler participating in the auction the right to reduce their obligation to purchase natural gas from MOL WMT and E.ON by the amount of gas that they will purchase directly or indirectly from the gas release programme. E.ON also undertakes to grant to those purchasers access to storage at regulated prices and conditions (See Storage undertaking).

(747) E.ON undertakes to modify and/or improve the implementing regime on the basis of the experience gained from the yearly auctions with a view to improving the effectiveness of the gas release programme.

(748) The objective of the gas release programme is to ensure sufficient competitive alternatives for access to gas on the Hungarian gas and electricity markets (independently of the parties and at competitive conditions) so as to prevent the new entity from foreclosing the access to gas resources for its downstream competitors in the gas and electricity markets.

(iv) Contract release

(749) ERI undertakes to assign to a third party (the “Third Party”) half of the contract between MOL WMT and MOL E&P for the supply of domestic gas (“Supply Contract”) within 6 months. Once the contract assignment becomes effective, the Third Party will take over all the rights and obligations of MOL WMT under the Supply Agreement for the part assigned to it. The assignment will become effective at the beginning of the gas year 2007 (July 2007) and will be valid for the whole duration of the Supply Contract, until 2016.

(750) According to the parties, the part of the Supply Contract to be assigned represents approximately 7.6-10 bcm of gas in total, with the volumes to be released in the first year amounting to 1.2 bcm.

(751) ERI will procure MOL to approve the partial transfer of the Supply Agreement. In addition, MOL will grant equal treatment to MOL WMT and the Third Party as regards the Supply Contract flexibility provisions.

(752) The assignment to the Third Party of half of the contract will be subject to the HEO’s and the Commission’s approval. The Third Party must not be the purchaser of MOL’s minority interests in MOL WMT and MOL Storage.

(753) In case E.ON (and subsequently the Divestiture Trustee) does not succeed in finding a Third Party for the partial assignment of the Supply Contract for the start of the gas year 2007 (or for a subsequent year), the gas quantities that would have been released in that given gas year will be added to the gas release programme for that year. In this case, E.ON (and the Divestiture Trustee) shall seek again to find a third party interested in the partial contract transfer until 50% of the Supply Contract has been effectively assigned.

(754) As for the gas release programme, the objective of the contract release programme is to ensure sufficient availability of gas on the Hungarian gas and electricity markets (independently of the parties and at competitive conditions) so as to prevent the new entity from foreclosing the access to gas resources for its competitors in the gas and electricity markets.

(v) Access to storage

(755) E.ON undertakes to grant access to storage capacities at regulated price and conditions to end users and wholesalers that purchase gas directly through the gas release programme or the contract release. In particular, E.ON undertakes to offer access to

sufficient storage capacities for those end users and wholesalers even if they purchase gas for the first time or develop an increased demand for storage when buying gas quantities through the gas release programme or the contract release.

- (756) E.ON undertakes to report any issue related to storage capacity constraints to the HEO. In any event, in accordance with the HEO resolution, E.ON is under an obligation to implement a storage development plan.
- (757) The objective of the access to storage capacities at regulated price and conditions is to ensure that successful bidders in the gas release programme and the Third Party assignee of the contract release will be able to structure the purchased gas quantities according to their own or their customers' needs.

B. Assessment of the concentration as modified by the remedies

- (758) In the framework of the market test on the proposed undertakings, the Commission contacted approximately 100 third parties, including gas and electricity operators (both Hungarian and international companies) and participants in other gas release programmes (notably in Germany). Moreover, the Commission contacted a number of national energy regulators in Member States with a view to benefiting from their expertise and knowledge of similar programmes.
- (759) Many respondents put forward concrete and substantial suggestions for amendments to the package proposed by the parties with a view to improving the overall package and making the commitments more effective. The most substantial suggestions related to the gas release programme and in particular to its overall duration, to the volumes of gas to be auctioned, to the minimum price of the auctions and to the flexibility rules as to the delivery of gas to the successful bidders.
- (760) The final package of undertakings, submitted on 8 December 2005 and described in Section A above, incorporates the bulk of the suggestions and comments made by third parties in the context of the market test. The undertakings in their final form, substantially improved compared to the parties' initial offer, thus meet the concerns expressed by third parties as regards the need to ensure sufficient liquidity of gas on the Hungarian wholesale gas market at price and conditions which will allow third parties to compete effectively with the new entity on the downstream Hungarian gas and electricity markets.
- (761) As described, the undertakings proposed by the parties aim essentially at (i) strengthening the positive unbundling of MOL E&P (gas production) and MOL Transmission (gas transmission) on the one hand and MOL WMT (gas wholesale) and MOL Storage (gas storage) on the other hand and at (ii) releasing volumes of gas on the Hungarian wholesale markets through a gas release and a contract release.

(i) Unbundling

- (762) The Commission has found that the 25% + 1 minority shareholdings which MOL would retain in MOL WMT and MOL Storage and the existence of the "put option" for the shareholdings of MOL Transmission to E.ON (even though the sale of MOL Transmission is not part of the present transaction), would create structural links between ERI and MOL which would provide the ability and the incentive for MOL

to discriminate against the parties' competitors for access to domestic gas, gas transmission services and new gas storage facilities.

- (763) The Commission is of the opinion that the divestment by MOL of its 25% + 1 interest in MOL Storage and MOL WMT within 6 months after the transaction remedies the concerns stemming from the structural links between MOL and E.ON. The market test has, to a very large extent, welcomed the severing of the structural link between the parties.
- (764) In particular, the sale of MOL's minority share in MOL Storage and MOL WMT would eliminate the incentive for MOL E&P to engage in discriminatory behaviour vis-à-vis potential future gas storage operators as regards the sale of depleted gas fields and the incentive of MOL Transmission to engage in discriminatory behaviour vis-à-vis traders and rival RDCs with a view to increase MOL WMT profits²⁸⁰.
- (765) Moreover, the Commission is also of the opinion that the fact that MOL will not exercise the put option vis-à-vis E.ON for the 25% of MOL Transmission (and not to sell E.ON a shareholding that would not result in the acquisition of joint control over MOL Transmission by E.ON and MOL or of sole control by E.ON) can contribute to alleviate the concerns that may stem from E.ON's becoming further integrated also in the gas transmission market. What is essential for the assessment is that the exercise of the put option by MOL for the 75% stake (or the sale of another shareholding) would result in a change of control of MOL Transmission and would be subject to the review and require the approval of the competent competition authorities (the Commission or the Hungarian Competition Authority).
- (766) By contrast, the exercise of the 25 % put option would not bring about a change in control of MOL Transmission, hence it would not be subject to any approval procedure, in spite of its creating a structural link between E.ON and MOL Transmission. The remedy at stake seeks precisely to avoid this situation, and, should the put option be exercised, will provide the competent competition authorities²⁸¹ with the opportunity to review the new transaction in the framework of the market situations prevailing at the time of the exercise of the put option.
- (767) A large number of respondents to the market test, while highlighting their concerns as regards the possibility that the new entity may also acquire control of the transmission network, have confirmed that the commitment at stake contributes to alleviate the concerns that may arise from such transaction, should the put option be exercised.

(ii) *Gas release programme and contract release*

a. European experience on gas release programmes

- (768) To be in a position to assess properly whether the gas release and the contract release commitments submitted by the parties are suitable to remove the competition concerns identified during the procedure, the Commission has carried out an

²⁸⁰ See section on the Impact of the transaction on the gas sector.

²⁸¹ The Commission or the Hungarian Competition Authority.

additional investigation focusing on existing similar programmes in various European countries.

(769) The main results of this investigation are set out here below.

General features

- (770) Gas release programmes and contract release programmes aim at making gas available to wholesalers and end users at the wholesale level. In this type of programmes, the gas incumbent company undertakes to offer certain quantities of gas for sale to its competitors/customers. The undertakings proposed by the parties in the present case comprise both a gas release and a contract release.
- (771) In a gas release programme, the gas incumbent offers for sale certain quantities of gas from its overall gas sourcing portfolio. Purchasers enter into supply contracts with the gas incumbent for these quantities. In a contract release programme, the gas incumbent transfers (assigns) part of its gas supply contracts with gas producers. Purchasers enter into a supply contract directly with the gas producers (without the intermediary of the incumbent) and the transferred gas supply contract(s) of the incumbent is terminated, or the gas quantities in the transferred supply contracts are reduced accordingly. Both types of programmes are designed to improve the liquidity of gas markets and enable competing traders and customers to acquire gas for their own use or for resale. The essential difference between contract and gas release is that the incumbent's supply portfolio remains the same in a volume release programme, while it is partly transferred to competitors/customers in a contract release programme.
- (772) The sale of the gas or the transfer of the gas supply contract may be achieved in two ways: (i) auctions, or (ii) bilateral contracts. The gas quantities may be sold through public auctions where companies with the highest bid are selected. In case of bilateral negotiations, the incumbent negotiates with interested companies and gas sales/contract transfers are concluded based on mutual agreement. The undertakings proposed by the parties in the present case comprise both a gas release through auctions and a contract release through bilateral negotiations.

Specific features

- (773) Gas release programmes have been and are being implemented in several European countries; experience is more limited for contract release programmes. Gas release programmes are either part of a broader action plan required under national law and/or designed by the national energy regulators to open the gas wholesale markets to competition (UK, Spain, Italy) or are implemented as undertakings in merger or antitrust procedures (France, Germany, Austria).
- (774) In order to assess whether the remedies proposed by the parties are suitable to remove the competition concerns identified, the Commission has contacted the energy regulators in each of the countries where a gas release programme has been implemented with a view to understanding whether the programme has actually fulfilled its objectives and to establishing which elements are crucial for a gas release programme to be effective. The recitals below describe the most important features for successful gas release programmes according to the Commission's assessment and based on the experience of the energy regulators.

- (775) The Commission has also drawn useful guidance and suggestions from the paper “Implementation of Gas Release Programmes for European Gas Market Development” published by the European Federation of Energy Traders²⁸² (EFET) to which the parties have widely referred.

Volumes

- (776) The quantities of gas to be released depend on the objectives of the gas release programme and of the regulatory framework. More specifically, in a merger case, the volumes should be sufficient to remove the competition concerns and thus depend on the number and the size of markets in which competition concerns arise. The released volumes need to be sufficient to exclude that the incumbent supplier can foresee that all or most of the released volumes will be acquired by certain customer categories. Only if the volumes released are sufficient to allow eligible customers in all affected markets to benefit from the programme (as direct purchasers or indirectly as customers of traders buying gas through the gas release programme) can a gas release programme offset the incumbent’s ability and incentives to engage in anticompetitive behaviour and thus remove the negative impact on competition.
- (777) A gas release programme should in addition foresee that gas quantities that were offered for sale but did not find a buyer a given year should be added to the quantities to be released the following years.

Duration of the programme

- (778) A gas release programme generally aims at increasing the liquidity on gas wholesale markets and facilitating new entries. In the context of a merger case, a gas release programme may seek to reduce or eliminate the merging parties’ ability and incentives to engage in behaviour that would significantly impede effective competition. To achieve these objectives, the gas release programme should remain in place for a sufficiently long time as to ensure that the market structure and the competitive conditions have changed significantly, and that the level of competition achieved through the programme is sustainable.

Price and costs

- (779) The price at which gas is available through the gas release programme should enable wholesalers to compete with the supplier of gas under the gas release on the gas wholesale and retail markets. The auction mechanism is a convenient way to allocate efficiently the gas quantities to be released. As the final price results from competitive bids, it is the price that bidders are willing to pay for the gas made available under the programme, given prevailing market conditions.

EFET: “The release programme will only be successful if the price of the gas or capacity made available to new entrants is low enough for the competition to compete. As a guide, the price must not be higher than the average price paid by the incumbent (including contractual discounts), nor must it be higher than the average netback from the incumbent’s eligible customers. If a release programme is also

²⁸² <http://www.efet.org>

used as a remedy to balance the incumbents' market power, the price must not be higher than that offered in the wholesale market, even if this implies a financial loss to the incumbent."

- (780) The WACOG is recognised in the EFET paper as one of the benchmarks for the definition of price mechanisms in auctions for gas release programmes.
- (781) As regards additional costs, all costs incurred by participants to the auctions and by successful bidders should be clearly defined. As a principle, the additional costs should be avoided unless there are specific reasons.

Gas supply duration and lot size

- (782) The duration of the gas supply contract and the size of the lots in a gas release programme should be designed so as to meet the needs of the various categories of bidders in the relevant markets.

Flexibility

- (783) The daily, quarterly and yearly flexibility provisions for the gas supplied through the gas release programme are essential. Wholesalers and industrial customers should have the ability to structure the gas quantities they purchase according to their own or their customers' consumption profiles. Depending on the conditions of access to storage, the requirements for the flexibility of the gas supplied through a gas release programme differ.
- (784) The annual flexibility (swing and TOP levels) should reflect the incumbent's average annual flexibility. As quarterly flexibility needs may be provided by the storage of gas, the flexibility provided by the seller in the gas release programme depends on access to storage.

EFET: "The swing and take-or-pay levels of the release gas programme should reflect the overall portfolio of the incumbent. If only flat gas is available, and access to storage or other flexibility tools is still difficult or at punitive prices, then competition in supply will not arise from the release programme."

- (785) Finally as regards daily flexibility, it is clear that wholesalers, especially small ones, and end users have higher flexibility requirements than large importers (such as the seller generally). Therefore, it is clear that a base-load gas supply or even a daily flexibility similar to the seller's gas portfolio's average daily flexibility may be insufficient.

German Ministry: "In our decision, only a base load supply was foreseen. Such a product has no flexibility and is not attractive for potential purchasers. Ruhrgas has voluntarily offered a certain degree of flexibility (...). For potential purchasers minimum gas deliveries in summer are an issue."

- (786) Experiences in European countries, particularly in Germany, show that the attractiveness of a gas release programme for small wholesalers and industrial customers strongly depends on the flexibility provisions of the gas supply.

Gas delivery points

- (787) The gas should be delivered at a delivery point from which wholesalers can easily transport and store the gas. A gas hub or cross-border entry points are therefore generally appropriate delivery points. A certain degree of flexibility for the choice of the delivery point (as is often the case for the seller) increases the attractiveness of the programme.
- (788) The delivery point location is in particular relevant when gas transmission network are split among various owners, when the level of free capacity is low in the transmission or storage system and when entry-exit tariffs (and not post stamp tariffs) are applicable. Availability of gas at more than one delivery point reduces the risk that the transmission regime constrains competition in any market area and ensures that purchasers face the same physical and operational risks as the seller.

EFET: "Gas should be made available at more than one entry point, in principle using the same entry points as where the incumbent brings in most of its gas. This reduces the possibility that the transportation regime constrains competition in any specific area or market segment. It also ensures that new entrants face the same physical and operational risks as the incumbent by sharing the same entry points. In deciding delivery locations, consideration must also be given to the ease and cost to participants of onward transportation and/or trading."

- (789) In a merger case, the delivery point of a gas release programme should be selected so as to enable wholesalers and end users to source gas from the gas release programme for resale or for their own use in the geographical market where competition concerns have been identified.

Security of supply

- (790) The gas supply conditions should include standard provisions on security of supply issues (maintenance, force majeure, off-spec, interruptibility, etc.) following the common practices in the relevant markets. The rights and obligations of the purchasers and the seller should be balanced.

Auction design and guarantees

- (791) The "ascending clock auction" has been used in several countries and is apparently an appropriate procedure to allocate the gas quantities. The organization of the auction should also ensure that the seller does not gain information on its competitors.
- (792) The amount of the deposits and guarantees should not be disproportionate and should not constitute a disincentive for potential bidders. Payment terms should reflect standard market practices and in particular those of the seller's upstream supply contracts.

EFET: "Credit terms must not unduly restrict participation of new entrants, especially smaller companies".

Access to transmission

- (793) Access to sufficient gas transmission capacities is necessary to ensure that wholesalers and end users purchasing gas through the gas release programme can transport gas to the place where the programme is intended to solve competition concerns. Thus, access to transmission capacities is essential and a gas release programme is not expected to be successful if little free capacity is available in the gas transmission network. If transmission capacity is booked by the company that organizes the gas release programme, it should be released to the transmission system operator to the extent of the gas quantities released.

EFET: “For gas release to be effective there needs to be properly implemented, regulated third party access downstream of the delivery point”.

- (794) Responses from market operators indicate that difficulties to obtain sufficient capacity to transport the acquired gas were one of the main issues explaining the lack of success of the first auctions in the German gas release programme of E.ON/Ruhrgas.

Access to storage

- (795) If the flexibility conditions foreseen in the gas release programme are not sufficient to meet the flexibility needs of wholesalers and end user, access to sufficient gas storage capacities is necessary to ensure that wholesalers and end users purchasing gas through the gas release programme can structure the acquired gas according to their own or their customers’ needs. Thus, access to storage capacities is essential and a gas release programme is not expected to be successful if marginal free capacity is available in the gas storage system. If storage capacity is booked by the company that organizes the gas release programme, it should be released to the storage system operator to the extent of the gas quantities released.

Access to customers

- (796) A gas release programme has little chance to be successful if the majority of customers are bound to their gas suppliers under long-term supply contracts. In these conditions, a gas release programme is not expected to introduce much competition on the gas markets as customers are not able to switch suppliers. Therefore, it is essential that customers purchasing gas in the gas release programme or indirectly from a trader purchasing gas in the gas release programme have the opportunity to terminate their existing gas supply contracts or to reduce their obligation to purchase gas.

Monitoring and review provision

- (797) Experience has shown that it was important for an effective gas release programme to be able to review the conditions of implementation to address the difficulties encountered with the practical implementation of the programme. Given the high complexity and the specificities of the various market conditions, it is essential to provide for a close monitoring by the competent national authorities and for sufficient flexibility to modify the auction and gas supply rules so as to take duly into account the needs of third parties.
- (798) While gas release programmes imposed by energy regulators may be easily reviewed and improved on an on-going basis, this is more difficult for gas release programme

constituting undertakings in merger cases. Therefore the degree of freedom of the parties to set the terms and conditions of the programme should be restricted to ensure the effectiveness of the remedy and most practical/technical rules for the implementation of the programme should not be part of the undertakings attached to a decision, but rather defined at a later stage under the supervision of the relevant competition authority.

b. Assessment of the gas release programme and on the contract release proposed by the parties

(799) The Commission has concluded that the gas release programme and the contract release as offered by the parties, incorporating the amendments and improvements proposed by third party respondents to the market test, are sufficient to remove all the competition concerns identified by the Commission as resulting from the transaction. In particular, the Commission considers that the combination of the gas release programme and the contract release will ensure that gas end users and wholesalers will have the ability to source their gas needs under competitive and non-discriminatory conditions and, for at least a significant part, independently from the merged entity.

Volumes

(800) In particular, the Commission considers that the volumes offered in the gas release programme (in conjunction with the volumes made available by the contract release for MOL E&P's production) are suitable to create sufficient liquidity of gas on the gas and electricity markets so as to ensure that effective competition can develop and remain sustainable. The total quantities of gas to be released through both remedies are significant in comparison to other existing gas release programmes.

(801) Based on MOL E&P current production forecasts (as included in Annex to the Supply Agreement), the Commission has estimated the quantities of gas that the parties undertake to release on a yearly basis until the gas year 2014/2015.

Quantities of gas released under the proposed commitments:

Gas Year	Quantities of gas released (in millions m ³)		
	Gas release	Contract release	TOTAL
2006/2007	500	[700-1300]*	[0-1000]*
2007/2008	1000	[700-1300]*	[2000-2500]*
2008/2009	1000	[700-1300]*	[2000-2500]*
2009/2010	1000	[700-1300]*	[2000-2500]*
2010/2011	1000	[500-1000]*	[1500-2000]*
2011/2012	1000	[500-1000]*	[1500-2000]*
2012/2013	1000	[500-1000]*	[1500-

			2000]*
2013/2014	1000	[0-500]*	[1000-1500]*
2014/2015	500	[0-500]*	[500-1000]*
TOTAL	8,000	[5000-10000]*	[13000-18000]*

(802) The table and chart in recital 799 above show that, at least until 2013/2014, substantial quantities of gas (around 2 bcm) will be released and the programmes will last until 2014/2015 (expiry of MOL WMT upstream procurement contracts and of MOL E&P's supply contract). The quantities released by the parties account for up to 14% of the total Hungarian demand and represent 21% of total third parties' gas sales (i.e., excluding sales of E.ON's RDCs and of MOL WMT). This means that third parties will have the ability to purchase a significant share of their gas from the gas release and/or the contract release.

(in million m ³)	Quantities of gas released	Hungarian gas consumption	%
2006/2007	[0-1000]*	[15000-20000]*	[0-10]*%
2007/2008	[2000-2500]*	[15000-20000]*	[10-20]*%
2008/2009	[2000-2500]*	[15000-20000]*	[10-20]*%
2009/2010	[2000-2500]*	[15000-20000]*	[10-20]*%
2010/2011	[1500-2000]*	[15000-20000]*	[10-20]*%
2011/2012	[1500-2000]*	[15000-20000]*	[10-20]*%
2012/2013	[1500-2000]*	[15000-20000]*	[5-15]*%
2013/2014	[1500-2000]*	[15000-20000]*	[5-15]*%
2014/2015	[0-1000]*	[15000-20000]*	[0-10]*%
TOTAL	[10000-20000]*	[140000-150000]*	[5-15]*%

- (803) The commitments do not foresee any restriction on the quality of participants to the gas release programme and the gas released may thus be purchased by commercial and industrial customers and power generators to meet their own needs or by gas traders. It is therefore not possible to estimate which quantities of gas released will be used in each of the relevant market where the Commission has identified competition concerns.
- (804) However, the total quantities of gas released over the gas years 2007/2008 to 2013/2014 represent approximately 60% of the size of the market for the supply of gas to power plants and 55% of the size of the market for the supply of gas to large industrial customers. The Commission therefore estimates that the released gas quantities will significantly increase liquidity and hence limit the likelihood of anticompetitive behaviour by the new entity.
- (805) The total quantities of gas to be released through both remedies are significant in terms of international benchmark. In this regard, the volumes of gas to be released are significantly higher (in percentage value) than in the similar programmes implemented in other European countries. For example, the gas release programme organized by Eongas in Austria amounts to 2.9% of the total Austrian gas market, the programme by E.ON Ruhrgas in Germany corresponds to 2.5% and ENI's programme in Italy represents 3.1% of total demand.

Gas release programme

- (806) The Commission believes that the gas release programme offered by the parties is designed, as regards its main features (volumes, duration, price mechanism) and in its more technical features (size of lots, duration of contracts, flexibility rules) largely in line with the criteria described in recitals 766 to 796 above, which are widely considered to be most relevant for the successful implementation of gas release programmes. The gas release programme was improved to take into account comments and suggestions made by respondents in the market test. The detailed rules for the effective implementation of the auction and the gas supply contracts will be elaborated by the parties under the scrutiny of the HEO, and submitted to the Commission for its approval.
- (807) The duration of the gas release programme will ensure that sufficient liquidity will be available for a sufficiently long time as to ensure that the market structure and competitive conditions have changed. It has to be highlighted that all of the parties' current supply agreements, including those with Gazprom / Panrusgáz, will have terminated by 2015. The new entity's gas supply contracts with Gazprom and the privileged access to gas resources (which confer to new entity the ability to foreclose access to gas to its downstream competitors and to significantly impede effective competition on the gas supply markets) will be open for competition at this date.
- (808) While the market investigation has revealed that Gazprom had no incentive to supply other traders competing with MOL WMT as long as it supplied the latter with gas quantities covering the bulk of the Hungarian gas consumption, at the expiry of the contract with MOL WMT, Gazprom will obviously have an economic interest in selecting its "Hungarian partner(s)" based on a competitive process. Large international market players already present in Hungary through ownership in the gas RDCs (ENI, RWE and GDF) will indeed have an interest in bidding for this

(these) new gas supply agreements with Gazprom and the Commission believes that the new entity and the largest gas traders active in Hungary will be in the same position to negotiate such supply agreement(s) in 2015.

- (809) Furthermore, the price mechanism foreseen for the programme will ensure that successful bidders will obtain gas at the same competitive conditions as the parties, and possibly cheaper, owing to the fact that the starting bidding price foresees a 5% discount off the WACOG. The Commission considers this pricing mechanism as enshrined in the remedies is attractive for third parties and will provide good incentives to participate actively in the programme's auctions. The remedy package also foresees that potential financial losses resulting from the price mechanism will be incurred by the parties for a considerable amount.
- (810) As regards the implementation of the gas release programme, it is important to ensure that all participants are admitted at transparent and non-discriminatory terms and that the sale is made at competitive conditions.
- (811) To this end, various parameters of the gas release programme have been modified by the parties following the market test in order to cater for the needs of potential buyers. For example, the size of the lots has been adjusted to meet the specificities of the Hungarian markets: three lots sizes are now offered to better meet the needs of the various categories of market players. The period between the auction and the delivery period has been extended by two months to give more time to successful bidders to find new customers if they intend to resell the gas they have acquired.
- (812) Access to customers is also granted under the proposed remedies as the parties undertake to amend the existing contracts of their existing customers intending to purchase gas from the gas release programme, either directly or through a wholesaler.
- (813) The Commission believes that the Hungarian regulatory framework (in particular "capacity-follows-the-customer" principle) should ensure that sufficient transmission and distribution capacities are made available to the successful bidders to transport the acquired gas within Hungary.

Contract release

- (814) The Commission believes that the assignee of the contract release will constitute a sizeable and sustainable competitive force in the Hungarian gas markets. The assignee will purchase significant quantities of gas from MOL E&P starting in July 2007 (expected date of the further liberalization of the Hungarian gas markets) until 2013/2014, independently from the new entity. It will also have to ability to combine the contract release with the purchase of gas quantities through the gas release programme until 2013/2014. The assignee of the contract release will therefore have sufficient long term gas resources to develop its position on the Hungarian gas markets and introduce liquidity on these markets.
- (815) The fact that the terms and conditions of the contract will be similar for the new entity and the assignee ensures that the latter will have the ability to compete with the new entity. In particular, MOL will grant equal treatment to WMT and the third party in exercising its put options concerning production quantities.

- (816) Access to customers is also granted under the proposed remedies as the parties undertake to entitle to amend the existing contracts of their existing customers from the Third Party assignee of the contract release.
- (817) The Hungarian regulatory framework (in particular “capacity-follows-the-customer” principle) should ensure that sufficient transmission and distribution capacities are made available to the Third Party assignee to transport the acquired gas within Hungary.

Storage

- (818) Additionally, the commitments of the parties to grant access to storage for the successful bidders of the gas release programme and the assignee of the contract release at regulated prices are sufficient to grant an effective and non-discriminatory access to the storage capacities for the relevant gas quantities. The Commission believes that this commitment will enable traders and customers to structure the acquired gas according to their own or their customers’ needs.

Monitoring

- (819) Finally, the effective monitoring by the HEO, with the assistance of the Commission’s Trustee, will help the Commission ensure that the parties will fully comply with their commitments for their full duration.

C. Conditions and obligations

- (820) Under the first sentence of the second subparagraph of Article 8(2) of the Merger Regulation, the Commission may attach to its decision conditions and obligations intended to ensure that the undertakings concerned comply with the commitments they have entered into vis-à-vis the Commission with a view to rendering the concentration compatible with the common market.
- (821) Where a condition is not fulfilled, the Commission decision declaring the merger to be compatible with the common market no longer stands. Where the undertakings concerned commit a breach of an obligation, the Commission may revoke the clearance decision in accordance with Article 8(5)(b) of the Merger Regulation. The undertakings concerned may also be subject to fines and periodic penalty payments under Articles 14(2)(d) and 15(2)(c) of the Merger Regulation.
- (822) In accordance with the basic distinction described above, this Decision should be subject to compliance with the conditions set out in Section B, subsection I and II of the Annex.
- (823) In accordance with the basic distinction described above, this Decision should be subject to compliance with the obligations set out in Section B, subsection III, IV and V and in Section C of the Annex.

VIII. CONCLUSION

- (824) It is concluded that the commitments submitted by the notifying party are sufficient to address the competition concerns raised by this concentration. Accordingly, subject to compliance with the commitments submitted by the notifying party, the notified operation should be declared compatible with the common market and the functioning of the EEA Agreement.

HAS ADOPTED THIS DECISION:

Article 1

The notified operation whereby E.ON Ruhrgas AG acquires sole control of MOL Földgázellátó Rt. and MOL Földgáztároló Rt. within the meaning of Article 3(1)(b) of the Regulation (EC) No 139/2004 is hereby declared compatible with the common market and the functioning of the EEA Agreement.

Article 2

Article 1 is subject to compliance with the conditions set out in Section B, subsection I of the Annex.

Article 3

Article 1 is subject to compliance with the obligations set out in Section B, subsection III, IV and V of the Annex.

Article 4

This decision is addressed to:

E.ON Ruhrgas International AG

E.ON Ruhrgas AG
Huttropstrasse 60
D - 45138 Essen
Germany

Done at Brussels, 21/XII/2005

Retail supply of electricity to residential customers	58
VI. COMPETITIVE ASSESSMENT	60
A. MOL WMT holds a dominant position in the wholesale supply of gas in Hungary	61
(i) MOL WMT controls domestic gas resources	62
(ii) MOL WMT controls competitive import sources	68
a. Competitive gas import sources in Hungary	69
b. MOL WMT's gas sourcing portfolio	69
c. Difficult access to Russian gas	71
EMFESZ	74
CENTREX	75
Western European market players	75
d. The parties' reply to the SO as regards access to competitive gas imports	76
Gazprom incentives	76

Availability of competitive gas in Baumgarten for import into Hungary	78
Existence of independent importers in the Hungarian wholesale gas market	83
(iii) MOL WMT enjoys further significant incumbency advantages	84
B. Impact of the transaction on the gas markets	87
(i) Supply of gas	87
a. The new entity will have the ability and incentive to foreclose access to wholesale gas to its competitors (RDCs and traders) in gas retail on the market for the supply of gas to small industrial and commercial customers	87
Ability to foreclose access to wholesale gas thereby raising the costs of competitors in the market for the supply of gas to small industrial and commercial customers	88
Incentive to foreclose access to wholesale gas thereby raising the costs of competitors in gas retail markets	89
b. The new entity will have the ability and incentive to foreclose its competitors in gas retail on the market for the supply of gas to residential customers	100
c. The new entity will acquire a dominant position in the supply of gas to large industrial customers	103
(ii) Storage of gas	105
a. MOL Storage holds a dominant position in the storage of gas in Hungary	105
b. The new entity will have the ability and incentive to discriminate against its competitors in granting access to storage	106
Discriminatory behaviour in granting access to storage	106
The development of storage capacity and the possibility of increased competition	109
(iii) Transmission of gas	111
a. Nabucco pipeline	112
b. Transmission of gas in Hungary	113
C. Impact of the transaction on the electricity markets	116
(i) Market players in the electricity sector in Hungary	117
a. E.ON	117
Electricity generation	117
Electricity wholesale	118
Electricity RDCs	118
Electricity retail in neighbouring countries	118
b. MVM	119
c. MAVIR	119
d. International groups	120
RWE	120
EDF	120
Electrabel	120
ATEL	120
Others	121
(ii) Electricity generation/wholesale	122
a. The structure of electricity generation in Hungary	123
Current generation structure	123
PPAs	124
New power plants projects	126
Limited potential for non gas-fired power plants	129
Power plants decommissioning	130
Importance of gas-fired power plants	131
b. The structure of electricity imports in Hungary	132
Current electricity imports	132
Evolution of electricity imports	132
c. The new entity will have the ability to foreclose access to gas to its competitors' gas-fired power plants	133
d. E.ON plans to expand significantly its electricity generation capacities in Hungary	137
e. The new entity will have the incentive to foreclose its competitors in electricity generation/wholesale	138
Foreclosure of access to gas	139
Tolling agreements	141
Existing power plants	144

f.	The new entity's incentives to foreclose its competitors in electricity generation/wholesale will increase with the further liberalization of the electricity sector and the increase in E.ON's generation capacity _____	144
(iii)	Electricity retail _____	147
a.	Market structure _____	147
	RDCs _____	147
	Electricity traders _____	148
b.	The new entity's strategies in electricity generation and wholesale would significantly impede effective competition in all the markets for the retail supply of electricity _____	149
c.	The new entity will have the ability and incentive to foreclose access to gas to its electricity retail competitors _____	151

Case M.3696 E.ON/MOL

COMMITMENTS TO THE EUROPEAN COMMISSION

submitted by E.ON Ruhrgas International AG

Pursuant to Article 8(2) of Council Regulation (EC) No. 139/2004 (the "Merger Regulation"), E.ON Ruhrgas International AG ("ERI") hereby provides the following Commitments (the "Commitments") in order to enable the European Commission (the "Commission") to declare the acquisition of control of ERI over MOL Földgázellátó Rt. ("WMT") and MOL Földgáztároló Rt. ("MOL Storage") compatible with the common market by its decision pursuant to Article 8(2) of the Merger Regulation (the "Decision"). The Commitments shall take effect upon the date of adoption of the Decision.

This text shall be interpreted in the light of the Decision to the extent that the Commitments are attached as conditions and obligations, in the general framework of Community law, in particular in the light of the Merger Regulation, and by reference to the Commission Notice on remedies and under Commission Regulation (EC) No 802/2004.

Section A. Definitions

Affiliated Undertakings: Undertakings controlled by the Parties and/or by the ultimate parents of the Parties, whereby the notion of control shall be interpreted pursuant to Article 3 Merger Regulation and in the light of the Commission Notice on the concept of concentration under Council Regulation (EEC) No 4046/89.

Date of Closing: The day on which ERI will have taken over sole control of WMT and MOL Storage.

Divestment Business: The businesses as defined in section B. I.

Divestiture Trustee: One or more natural or legal person(s), independent from the parties, who is (are) approved by the Commission and appointed by ERI or MOL and who has (have) received from ERI or MOL the exclusive trustee mandate to sell the Divestment Business (in case of MOL) or the transferred business according to section IV (in case of ERI).

Effective Date: The day of adoption of the Decision.

ERI: Throughout this document the term ERI shall also apply to WMT and MOL Storage in the sense that after the Date of Closing ERI will cause WMT and MOL Storage to comply with their obligations as identified in this document.

First Divestiture Period: The period of six months from the Date of Closing.

HEO: The Hungarian Energy Office.

MOL: MOL Hungarian Oil and Gas Company Rt., including its gas exploration and production division (MOL E&P)

MOL Transmission: MOL Földgázszállító Rt.

Monitoring Trustee: One or more natural or legal person(s), independent from the Parties, who is approved by the Commission and appointed by ERI and MOL (as procured by ERI), and who has the duty to monitor ERI's and MOL's compliance (as procured by ERI) with the conditions and obligations attached to the Decision.

Trustee(s): The Monitoring Trustee and the Divestiture Trustee.

Trustee Divestiture Period: Period of three months from the end of the First Divestiture Period.

Section B. The proposed remedies

(i) I. Ownership Unbundling

1. Under the agreements concluded between MOL and ERI, MOL remains a shareholder of WMT and MOL Storage and it enjoys put-option rights under which MOL can require ERI to purchase the remaining 25 % plus one share interests which MOL will have in WMT and MOL Storage following the date of closing of the transaction. The put-options have a term of 5 years.
2. ERI undertakes to procure MOL to dispose of its remaining 25 % plus one share interest in WMT and MOL Storage (the “Divestment Business”) within six months following the Date of Closing. The disposal and acquisition of the Divestment Business will be subject to the approval of the HEO.
3. The disposal of the Divestment Business to a third party is subject to the Commission’s approval. The Commission shall grant its prior approval if the disposal to the third party does not, in the light of the information available to the Commission, create competition concerns in the Hungarian energy markets or does not give rise to a risk that the implementation of the Commitments will be delayed. ERI is not a third party within the meaning of this subsection.
4. Should MOL, in spite of its best efforts, encounter difficulties arising from regulatory or other government-induced proceedings, such as a possible clearance procedure before the HEO, in the disposal of the Divestment Business, ERI shall immediately inform the Commission and then rely on the review-clause mechanism set out under section D. of this document below.
5. A Monitoring Trustee will supervise the divestiture of the Divestment Business in WMT and MOL Storage. ERI shall procure MOL to submit written reports in English on potential transferees of the Divestment Business and developments in the negotiations with such potential transferees to the Commission and the Monitoring Trustee no later than ten days after the end of every month following the Date of Closing.

ERI shall procure MOL to inform the Commission and the Monitoring Trustee on the preparation of the data room documentation and the due diligence procedure and shall submit a copy of an information memorandum, if any, to the Commission and the Monitoring Trustee before sending the memorandum out to potential transferee.

6. If MOL has not entered into a final agreement with a third party or exercised its put-option vis-à-vis ERI at the end of the First Divestiture Period, ERI shall procure MOL to grant the Divestiture Trustee an exclusive mandate to sell the Divestment Business to a purchaser at no minimum price within the Trustee Divestiture Period. ERI shall be deemed to have complied with this Commitment if, by the end of the

Trustee Divestiture Period, MOL has entered into a final binding agreement on the disposal, if the Commission approves the transferee and the terms in accordance with subsection I.3 and if the closing of the disposal of the Divestment Business takes place within a period not exceeding three months after the approval of the transferee and the terms of disposal by the Commission.

7. The final binding agreement shall be conditional on the Commission's prior approval. When MOL has reached an agreement with a transferee, ERI shall procure MOL to submit fully documented and reasoned proposal, including a copy of the final agreement, to the Commission and the Monitoring Trustee. ERI must be able to demonstrate to the Commission that the transferee meets the requirements according to subsection I.3 and that the Divestment Business is being sold in a manner consistent with the Commitments. For the approval, the Commission shall verify that the transferee fulfils the transferee's requirements according to subsection I.3 and then the Divestment Business is being disposed of in a manner consistent with the Commitments.
8. In order to maintain the structural effect of the Commitments, ERI shall procure MOL, for a period of 10 years after the Effective Date, not to acquire direct or indirect minority stakes in WMT or MOL Storage as long as ERI is a majority shareholder, unless the Commission has previously found that the structure of the market has changed to such an extent that the absence of influence of MOL over WMT or MOL Storage is no longer necessary to render the proposed concentration compatible with the common market.

II. Put Option Mol Transmission

Under the Transmission Put Option Agreement concluded between MOL and ERI, MOL is granted a put option under which MOL can require ERI to purchase a 25 % plus one share or a 75 % minus one share interest in MOL Transmission. ERI hereby undertakes to the Commission that it shall procure MOL not to exercise the put option for the sale of 25 % plus one share interest in MOL Transmission. Also, ERI shall procure MOL, within the time period defined in section I.8., not to sell to ERI or any of its Affiliated Undertakings a share interest in MOL Transmission which would not result in the acquisition of sole control over MOL Transmission by ERI or of joint control over MOL Transmission by ERI and MOL. The terms "sole and joint control" are to be interpreted in compliance with the Merger Regulation.

III. Gas Release Programme

1. ERI undertakes to organize and implement a gas release programme to become effective on the Hungarian market. Under the gas release programme, ERI will offer for sale (release) natural gas on a non-discriminatory and transparent basis under the following terms and conditions:

1.1. The amount of gas to be auctioned each year will be 1 billion m³. The amount of 1 billion m³ will be auctioned in the years 2006, 2007, 2008, 2009, 2010, 2011, 2012 and 2013 respectively. However, by the end of 2010, ERI will have the possibility to apply for a termination of the gas release programme at the end of the initial five-year period if it can demonstrate to the Commission, on the basis of data available from the HEO and other public and reliable sources, that the market conditions have significantly changed.

The first auction and its envisaged date of commencement for the gas year 2006/2007 (July 1st) will be announced to the Hungarian market and be published on the websites of ERI and WMT no later than one month after the Date of Closing. The subsequent first auction will take place in the first week of May. In the next years, the auctions will take place in the first week of March. The above-mentioned gas volumes refer to gas suitable for public utility services according to the prevailing Hungarian national standard or in case there will be no public utility service always to the prevailing Hungarian national standard.

1.2. The sale will be organized by way of a business-to-business internet auction. Participants will be invited at an appropriate point of time before the beginning of the gas year to place their bids remotely via the internet. In 2006, the bidders will be invited in April; in the next years, they will be invited in February. Each auction shall comprise 5 tranches of 100 million m³, 5 tranches of 50 million m³ and 10 tranches of 25 million m³ each with a duration of two years to be delivered to the successful bidders according to the flexibility provisions foreseen in paragraph 1.7. below. The quantity of the tranches will be equally split over two years. It will be possible to bid for more than one tranche at the discretion of the participant.

The execution of the auctions will be carried out by an international IT-service provider. The auction procedure shall be handled so as to ensure that WMT will not gain knowledge of the intermediary bids placed by participants to the auction. Only the number of lots awarded to each successful bidder and the final auction price shall be communicated to WMT. The auction process shall be documented including the intermediary bids and name of the bidders. The documentation shall be made available to WMT after the auction has been terminated in order to enable WMT and/or ERI to discuss with the Monitoring Trustee and the HEO any comments or

representations which may have been made by companies which have participated in the gas release programme

ERI shall submit, within two months after the Effective Date, a proposal for the technical implementation of the auctions and the details of the supply contracts for gas delivered to successful bidders to the HEO for its comments and review. At the same time the proposal will also be submitted to the Commission. The review by the HEO shall be concluded within one month after the submission of the proposal by ERI. Further to the review by the HEO, the proposal of ERI shall be subject to the approval of the Commission.

The procedure of the auction (e.g. auction mechanism, bidding stages) should be designed so as to ensure a transparent and non-discriminatory allocation of the offered gas quantities in a competitive way. ERI undertakes to fully abide by the procedure for the technical implementation of the auctions as approved by the Commission and as possibly modified according to paragraph 2.2. hereunder.

The terms and conditions of the supply contracts for gas delivered to successful bidders to the auctions (e.g. nomination procedure, payment periods, price indexation etc) and in particular as regards the security of supply and penalties (e.g. situation of maintenance, force majeure, off-spec gas, interruptibility, etc.) should be in line with standard practices of the Hungarian gas markets.

- 1.3. Each auction process will start at a minimum price as defined in subsection 1.4. below and shall be based on the weighted average cost of gas (WACOG) of WMT. The WACOG shall be calculated as the weighted average cost of gas under all gas purchase contracts of WMT and shall closely reflect WMT's actual net cost of procurement of gas (both domestic and imported) at the time of each auction. The respective calculations are subject to a verification procedure carried out by the Monitoring Trustee who will report to the Commission pursuant to Section C II 2. (d) (2) of the Commitments. The general methodology of the WACOG calculation shall be submitted to the Commission two months after the Effective Date for its prior review and timely approval.
- 1.4. WMT will carry out the auction at a discounted minimum price which will be 95% of WACOG provided that the aggregate loss WMT may incur as a result of the final auction price being set below WACOG does not exceed EUR 26 million. The loss in a given auction is the negative difference between the final auction price minus the respective WACOG multiplied with the volumes of gas sold under this auction. After each auction, WMT will communicate any such loss WMT has incurred as the case may be to the Monitoring Trustee who is entitled to verify this information if required.

- 1.5. Quantities that are not sold in the auction shall be carried forward to the following years. Unsold quantities of a specific year's gas release programme shall be reoffered with one third of the quantities each in the following three auctions. Such final auctions for unsold quantities will not take place after 2014.
- 1.6. Potential bidders must register for the auction process and will be admitted to the auction process upon payment of a deposit (per tranche they intend to bid for) for the participation. The amount of the deposit shall be in line with standard practices of the European gas market and shall be established in consultation with the HEO. This deposit can also be made by providing a bank guarantee. This deposit will be returned to the bidders after the end of the auction. Successful bidders will have to place an additional deposit as guarantee for the payment of the purchase price. The amount of such payment guarantee will be fixed in consultation with the HEO depending on the amount the successful bidder will have to pay for gas volumes acquired in the auction.
- 1.7. The sales contract will provide for an annual minimum offtake obligation of 85 % to the effect that the purchaser will only have to purchase and pay 85 % of the annually contracted quantity. The daily minimum offtake obligation for successful bidders shall not exceed the weighted average daily minimum offtake obligation of all purchase contracts of WMT (currently being 50%). The quarterly minimum offtake obligation shall be 85 % of the quarterly contracted quantities. In case the respective daily and quarterly minimum offtake obligations of the import contracts change, the weighted average daily and the quarterly minimum offtake obligations shall be adapted accordingly. WMT shall submit its calculations of the weighted average daily and of the quarterly minimum offtake obligations (including the methodology used for these calculations) to the HEO for its review (see subsection 2.2. below) and shall publish the results on WMT's webpage.
- 1.8. In the auction process, each tranche will be offered for 80% gas delivery at the Hungarian side of the Eastern entry point into Hungary and 20% at the Hungarian side of the Western entry point into Hungary.

The successful bidders shall bear the (regulated) cross-border transmission fees for the acquired gas and, for the volumes to be offered at the Hungarian side of the Western entry point into Hungary also the transportation fee on the HAG pipeline from Baumgarten to the Hungarian border. These fees shall be separately identified and added by WMT to the price of the gas sold under the gas release program.

In case the Hungarian grid code is changed and the 80%/20% ratio is amended, WMT undertakes to correspondingly change its Commitments under this subsection.

- 1.9. Transport capacity booked by WMT with MOL Transmission shall be returned to MOL Transmission by WMT in the amount and to the extent that gas is sold to the successful bidders. ERI shall procure MOL Transmission in turn, to ensure that the necessary transmission capacities are available for the successful bidders.
- 1.10. Existing direct customers of WMT or ERI which participate in the auction processes or which purchase gas from a trader/wholesaler, who participates in the auction processes, are entitled to ask WMT or ERI for an extraordinary contractual modification in order to reduce their obligation to purchase natural gas from WMT or ERI by the amount of gas they will have purchased as a result of the gas release programme. The other terms and conditions of the gas supply contracts between these direct customers and WMT or ERI shall not be modified. The total amount of reductions must not be higher than the quantities sold in the auction processes.
- 1.11. ERI and all of its Affiliated Undertakings are excluded from placing bids in the auction processes, be it directly or indirectly through an agent. Furthermore, ERI and all of its Affiliated Undertakings shall be excluded from purchasing gas from the successful bidders, be it directly or indirectly through an agent.
2. A Monitoring Trustee and the HEO will supervise the auction processes under the gas release programme.
 - 2.1. Within a period of two months after the conclusion of each annual auction process up until the year 2010, ERI or WMT will inform the Monitoring Trustee and the HEO about the implementation of the yearly gas release programme and will make the respective tender and bidding documents, correspondence and contracts available to the Monitoring Trustee and the HEO for onward reporting to the Commission.
 - 2.2. ERI undertakes to modify and/or improve the implementing regime established for the implementation of the gas release programme on the basis of the experience gained from the yearly auctions with a view to solve issues raised by participants to the previous auctions and to improve the effectiveness of the program in achieving greater liquidity on the Hungarian wholesale gas markets. The Monitoring Trustee and the HEO shall therefore receive and hear comments or representations from companies which have participated or which intend to participate in the gas release auctions. The Monitoring Trustee will evaluate such comments or representations and afford WMT the opportunity to reply to the comments or representation and to adduce factual evidence to the extent necessary. Should the findings of the Monitoring Trustee in his opinion give reasons for concern as to the implementation of the remedy, the Monitoring Trustee will prepare a written report to the Commission which will also be provided to WMT and to the company which had initially made the comments or representations, provided however, that business

secrets of WMT must not be revealed to this company and that business secrets of this company must not be revealed to WMT. The proposal for the amendment and/or improvement of the implementing regime established for the implementation of the gas release programme will be submitted to the HEO for its comments and review. At the same time the proposal will also be submitted to the Commission. The review by the HEO shall be concluded within one month after the submission of the proposal by ERI. Further to the review by the HEO, the proposal of ERI shall be subject to the approval of the Commission.

IV. Contract release

1. In addition to its gas release programme, ERI undertakes to partially transfer and assign WMT's rights and obligations in and to its gas supply agreement with MOL (MOL E&P) to a third party gas trader in Hungary in respect of a 50 % portion of the gas volumes, including also the proportional volumes to be sold at the option of MOL contracted to be delivered and received under the terms of the said agreement. (**Note:** In view of the domestic production forecast indication as of today, this 50 % represent app. 7.6 – 10 billion m³, whereas the amount to be released in the first year will correspond to app. 1.18 billion m³.) The above-mentioned gas volumes refer to gas suitable for public utility services according to the prevailing Hungarian national standard or in case there will be no public utility service always to the prevailing Hungarian national standard.
 - 1.1. This transfer shall become effective at the beginning of the gas year 2007 (July 1st) and shall remain in force through to the end of said gas supply agreement (June 30th 2015).
 - 1.2. Under the terms of the transfer agreement, the third party gas dealer shall assume all of the rights and obligations of WMT under the supply agreement in respect of said 50 % portion of the gas volumes contracted under said agreement, and ERI shall procure MOL to agree to fulfil its delivery obligations stipulated under the supply agreement towards such third party in respect of said 50 % portion of the gas volumes. ERI shall procure MOL, in exercising its put options concerning production quantities, to grant equal treatment to WMT and the third party, respectively, according to the percentages of their contracted volumes and to acknowledge and agree that, in respect of this 50 % portion of gas volumes, MOL has established a direct contractual relationship with the third party whereby each of them shall be liable to the other for the rights and obligations assumed, without any recourse to ERI or WMT.

- 1.3. ERI shall procure MOL to approve the partial transfer of the supply agreement.
- 1.4. Within the First Divestiture Period, ERI undertakes to use its best efforts to transfer said portion of the gas supply agreement to a third party gas trader acceptable to MOL and to the Commission. The third party must be (a) independent of and unconnected to ERI and (b) have the financial resources, proven expertise and incentive to maintain and develop the transferred business as a viable and active competitive force in competition with ERI and other competitors. Moreover, this third party must not be identical to a possible purchaser of the Divestment Business.

The final transfer agreement shall be conditional on the Commission's prior approval. When WMT has reached an agreement with a purchaser, it shall submit a fully documented and reasoned proposal, including a copy of the final agreement, to the Commission and the Monitoring Trustee. ERI must be able to demonstrate to the Commission that the purchaser meets the above mentioned purchaser requirements and that the transferred business is being sold in a manner consistent with the Commitments. For the approval, the Commission shall verify that the purchaser fulfils said requirements and that the transferred business is being sold in a manner consistent with the Commitments.

In case that ERI has not entered into such an agreement within the six months period, ERI shall grant the Divestiture Trustee an exclusive mandate to transfer the portion of the supply agreement according to the terms and conditions of that agreement within the Trustee Divestiture Period, even without any additional consideration paid by the third party to WMT.

Should the Divestiture Trustee not be able to enter into such an agreement with a third party, it shall submit a report to the Commission which sets out and explains why ERI and the Divestiture Trustee have been unsuccessful in transferring said portion of the supply agreement. The annual volume of gas for that given gas year and, as the case may be, subsequent years, shall then be added to the gas release programme of that year in accordance with section III. For the following gas year, ERI shall then again seek to identify a third party gas trader in accordance with sections 1.1. to 1.4. above. In such a case the First Divestiture Period shall start on May 1st of the respective next year before the next gas year (e.g. for the gas year 2008 in June 2007). The same applies accordingly to the Trustee Divestiture Period which shall start on November 1st. The rights and obligations of the Divestiture Trustee apply accordingly for these subsequent years. The same is true for WMT's obligation to add the respective gas to the gas release programme of the following year. As a result, the gas release programme could continue to run for a longer term as described under section III, i.e. until the end of the gas supply agreement between WMT and MOL.

Existing direct customers of WMT or ERI which participate in the auction processes or which purchase gas from a trader/wholesaler, who participates in the auction processes, are entitled to ask WMT or ERI for an extraordinary contractual modification in order to reduce their obligation to purchase natural gas from WMT or ERI by the amount of gas they will have purchased as a result of the gas release programme. The other terms and conditions of the gas supply contracts between these direct customers and WMT or ERI shall not be modified. The total amount of reductions must not be higher than the quantities assigned to the third party trader in the contract release.

2. The Monitoring Trustee and the HEO shall be empowered to supervise that MOL is fully cooperative in bringing about the Contract Release and does not refuse to accept the transfer of the 50 % portion of the gas supply agreement to a suitable third party, which is eligible under this section IV and which is prepared to agree to the transfer of the agreement. The Monitoring Trustee and the HEO will have the power to review all relevant documents and correspondence. Should they see reasons for concern, they will immediately report these concerns to the Commission and give their opinion as to whether MOL has shown good cause for its behaviour. MOL and ERI will be provided with an opportunity to be heard.
3. Neither ERI nor any of its Affiliated Undertakings shall directly or through an agent purchase gas from the third party gas trader in Hungary.

V. Storage Capacity

1. ERI undertakes to make available storage capacities in Hungary under the terms and conditions as described in the following:

ERI undertakes to transfer under the applicable regulated prices and conditions, as approved by the HEO, storage capacities required by successful bidders which purchase gas quantities in the gas release programme as described under section III. and/or gas quantities in the MOL E&P contract release as described under section IV above in order to structure the acquired gas quantities for their own or their customers' needs.

In this respect, the current regulatory conditions provide that existing customers that switch from the regulated to the open market take their storage capacity into the open market. This will also apply to such customers being supplied with volumes from the gas release programme and/or the MOL E&P contract release. For customers and/or wholesalers that purchase gas for the first time, or develop an increased storage demand when buying gas quantities from the gas release programme and/or the MOL E&P contract release, ERI undertakes to offer them

sufficient access to storage capacities to structure the acquired gas quantities for their own or their customers' needs. Access to storage capacity shall be granted under the applicable regulated prices and conditions.

2. A Monitoring Trustee and the HEO will supervise that MOL Storage makes available storage capacities in Hungary under the terms and conditions defined in subsection 1. They will have the power to review all relevant documents and correspondence. Should the Monitoring Trustee or the HEO see reasons for concern, they will immediately report these concerns to the Commission and give their opinion as to whether MOL Storage has shown good cause for its behaviour. MOL Storage will be provided with an opportunity to be heard.

In case MOL Storage is unable to give access to the storage capacities requested by the successful bidders to the gas release programme and the third party trader of the contract release due to contractual or technical constraints in storage capacities, MOL Storage shall submit within 15 days from the date of the unfulfilled demand for access to storage, to the Monitoring Trustee and the HEO a report explaining the constraints in storage capacities. Furthermore, MOL Storage will comply with the decision of the HEO under which it is obliged to complete the development of gas storage capacity provided in the respective plan of MOL Storage covering the years 2005 until 2009 by the end of such period.

Section C. Trustees

I. Appointment Procedure

1. ERI shall procure MOL to appoint a Monitoring Trustee in relation to the Divestment Business to carry out the functions specified in the Commitments for a Monitoring Trustee.

ERI shall appoint a Monitoring Trustee concerning the gas release programme, the contract release and the storage capacity to carry out the functions specified in the Commitments for a Monitoring Trustee. ERI may appoint only one person as a Monitoring Trustee for the above mentioned tasks.

2. If MOL has not entered into a binding agreement regarding the disposal of the Divestment Business one month before the end of the First Divestiture Period or if the Commission has rejected a transferee proposed by MOL at that time or thereafter, ERI shall procure MOL to appoint a Divestiture Trustee to carry out the functions specified in the Commitments for the Divestiture Trustee.

If ERI has not entered into a transfer agreement one month before the end of the First Divestiture Period or if the Commission has rejected a purchaser proposed by ERI at that time or thereafter, ERI shall appoint a Divestiture Trustee to carry out the functions specified in the Commitments for the Divestiture Trustee. The appointment of the Divestiture Trustees shall take effect upon the commencement of the Trustee Divestiture Period.

3. The Trustees shall be independent of MOL and ERI, possess the necessary qualifications to carry out their mandate, for example as an investment bank or consultant or auditor, and shall neither have nor become exposed to a conflict of interest. The Trustees shall be remunerated in a way that does not impede the independent and effective fulfilment of its mandate.
4. No later than one month after the Effective Date, ERI shall submit (and shall procure MOL to submit) a list of one or more persons whom MOL or ERI propose to appoint as the Monitoring Trustee to the Commission for approval. No later than one month before the end of the First Divestiture Period, ERI (in case of the Contract Release Programme) shall submit and shall procure MOL (in case of the Divestment Business) to submit a list of one or more persons whom MOL and ERI, respectively, propose to appoint as Divestiture Trustee to the Commission for approval. The proposal shall contain sufficient information for the Commission to verify that the proposed Trustee fulfils the requirements set out above and shall include:
 - a) the full terms of the proposed mandate, which shall include all provisions necessary to enable the Trustee to fulfil its duties under these Commitments;
 - b) the outline of a work plan which describes how the Trustee intends to carry out its assigned tasks;
 - c) an indication whether the proposed Trustee is to act as both Monitoring Trustee and Divestiture Trustee or whether different Trustees are proposed for the two functions.
5. The Commission shall have the discretion to approve or reject the proposed Trustee(s) and to approve the proposed mandate subject to any modification it deems necessary for the Trustee to fulfil its obligations. If only one name is approved, ERI, shall appoint and procure MOL to appoint, the individual or institution concerned as Trustee, in accordance with the mandate approved by the Commission. If more than one name is approved, MOL or ERI, respectively, shall be free to choose the Trustee to be appointed from among the names approved. The Trustee shall be appointed within one week of the Commission's approval, in accordance with the mandate approved by the Commission.
6. If all the proposed Trustees are rejected, ERI, shall submit and, as the case may be, procure MOL to submit the names of at least two more individuals or institutions

within one week of being informed of the rejection, in accordance with the requirements and the procedure set out above.

7. If all further proposed Trustees are rejected by the Commission, the Commission shall nominate a Trustee, whom ERI shall appoint and shall procure MOL to appoint, in accordance with a Trustee mandate approved by the Commission.

II. Functions of the Trustees

1. Each Trustee shall assume its specified duties in order to ensure compliance with the Commitments. The Commission may, on its own initiative or at the request of the Trustees, MOL or ERI give any orders or instructions to the Trustee(s) in order to ensure compliance with the conditions and obligations attached to the Decision.

MOL and ERI will only have the power to request such orders and will only be involved in the monitoring procedure according to the following procedural steps as far as their particular obligations under the Commitments are concerned, i.e. MOL in respect of the divestiture of its minority stakes in WMT and MOL Storage and ERI in respect of the gas release programme, contract release and storage capacity.

2. The Monitoring Trustees shall:
 - a) propose in their first report to the Commission a detailed work plan describing how they intend to monitor compliance with the obligations and conditions attached to the Decision.
 - b) assume the other functions assigned to the Monitoring Trustee under the conditions and obligations attached to the Decision;
 - c) propose to MOL or ERI such measures as the Monitoring Trustees consider necessary to ensure MOL's or ERI's compliance with the conditions and obligations attached to the Decision;
 - d) provide to the Commission, sending MOL or ERI a non-confidential copy at the same time, a written report
 - (1) in case of the disposal of the Divestment Business within 15 days after the expiry date according to section B. I. 2.;
 - (2) in case of the gas release programme for each auction by the end of July;
 - (3) and in case of the contract release for each transfer agreement, as the case may be one month after the expiry date of the First Divestiture Period and the Trustee Divestiture Period, respectively.

In addition to these reports, the Monitoring Trustees shall promptly report in writing to the Commission, sending MOL or ERI a non-confidential copy at the same time, if it

concludes on reasonable grounds that MOL or ERI is failing to comply with these Commitments.

3. As far as MOL is concerned, the Divestiture Trustee shall within the Trustee Divestiture Period sell at no minimum price the Divestment Business to a transferee, provided that the Commission has approved both the transferee and the final binding agreement in accordance with the procedure laid down in section B. I. 1.3. The Divestiture Trustee shall include in the agreement such terms and conditions as it considers appropriate for an expedience sale in the Trustee Divestiture Period. In particular, the Divestiture Trustee may include in the agreement such customary representations and warranties and indemnities as are reasonably required to effect the disposal. The Divestiture Trustee shall protect the legitimate financial interests of MOL, subject to the parties' unconditional obligations to divest at no minimum price in the Trustee Divestiture Period.
4. As far as ERI is concerned, the function of the Divestiture Trustee is defined in section IV. 1.4.
5. In the Trustee Divestiture Period (or otherwise at the Commission's request), the Divestiture Trustee shall provide the Commission with a comprehensive monthly report written in English on the progress of the divestiture process. Such reports shall be submitted within 15 days after the end of every month with a simultaneous copy for the Monitoring Trustee and a non-confidential copy to the Parties.

III. Duties and obligations of the Parties

1. ERI shall provide and shall cause its advisors and MOL's advisors to provide the Trustees with all such cooperation, assistance and information as the Trustees may reasonably require to perform their tasks. The Trustees shall have full and complete access to any of ERI's or MOL's or the Divestment Business' books, records, documents, Management or other personnel, facilities, sites and technical information necessary for fulfilling their duties under the Commitments, and MOL and ERI shall provide the Trustees upon request with copies of any document. MOL or ERI shall make available to the Trustees one or more offices on their premises and shall be available for meetings in order to provide the Trustee with all information necessary for the performance of their tasks.
2. ERI shall cause MOL's advisors to provide the Monitoring Trustee, on request, with the information submitted to potential transferees, in particular give the Monitoring Trustee access to the data room documentation and all other information granted to potential transferees in the due diligence procedure. MOL shall inform the

- Monitoring Trustee on possible transferees, submit a list of potential transferees, and keep the Monitoring Trustee informed of all developments in the divestiture process.
3. MOL and ERI, respectively, shall grant or procure Affiliated Undertakings to grant comprehensive powers of attorney, duly executed, to the Divestiture Trustee to effect the disposal/transfer, the Closing and all actions and declarations which the Divestiture Trustee considers necessary or appropriate to achieve the disposal/transfer and the Closing, including the appointment of advisors to assist with the disposal/transfer process. Upon request of the Divestiture Trustee, MOL and ERI shall cause the documents required for effecting the disposal/transfer and the Closing to be duly executed.
 4. MOL and ERI shall indemnify the Trustees and their employees and agents (each an "Indemnified Party") and hold each Indemnified Party harmless against, and hereby agrees that an Indemnified Party shall have no liability to MOL or ERI for any liabilities arising out of the performance of the Trustees' duties under the Commitments, except to the extent that such liabilities result from the willful default, recklessness, gross negligence or bad faith of the Trustees, their employees, agents or advisors.
 5. At the expense of MOL or ERI, the Trustees may appoint advisors (in particular for corporate finance or legal advice), subject to MOL's or ERI's approval (this approval may not be unreasonably withheld or delayed) if the Trustees consider the appointment of such advisors necessary or appropriate for the performance of their duties and obligations under the mandate, provided that any fees and other expenses incurred by the Trustees are reasonable. Should MOL or ERI refuse to approve the advisors proposed by the Trustees, the Commission may approve the appointment of such advisors instead, after having heard MOL or ERI. Only the Trustee shall be entitled to issue instructions to the advisors. Subsection 4. shall apply mutatis mutandis.

IV. Replacement, discharge and reappointment of the Trustees

1. If a Trustee ceases to perform its functions under the Commitments or for any other good cause, including the exposure of the Trustee to a conflict of interest:
 - (a) the Commission may, after hearing the Trustee, require MOL or ERI to replace the Trustee; or
 - (b) MOL or ERI, with the prior approval of the Commission, may replace the Trustee.

2. If a Trustee is removed, the Trustee may be required to continue in its function until a new Trustee is in place to whom the Trustee has effected a full hand over of all relevant information. The new Trustee shall be appointed in accordance with the procedure referred to in section I.
3. Beside the removal, the Trustee shall cease to act as Trustee only after the Commission has discharged it from its duties after all the Commitments with which the Trustee has been entrusted have been implemented. However, the Commission may at any time require the reappointment of the Trustee if it subsequently appears that the relevant remedies might not have been fully and properly implemented.

Section D. Mediation

1. In the event that a third party, notably but not exclusively a bidder in an auction under the gas release program, has reasons to believe that ERI is failing to comply with the requirements of the Commitments, the Monitoring Trustee may be instructed by the Commission to act as mediator to attempt to settle the dispute amicably. The Monitoring Trustee shall be allowed to appoint further professionals to assist him in the mediation process. The appointment of such professionals must be acceptable to ERI and the third party.
2. The procedure of the Mediation process under the Monitoring Trustee stewardship shall be proposed by the Monitoring Trustee and agreed to by ERI and the third party. The Monitoring Trustee shall also set forward a proposal as to who bears the costs of the mediation procedure which shall take into account general mediation standards. The procedure shall correspond to the European Code of Conduct for Mediators as developed by the European Commission and launched on 2 July 2004 in as far as appropriately applicable under the stewardship of the Monitoring Trustee. The procedure shall comprise a first phase of exchange of written observations between the parties. It is envisaged that the deadlines to reply to the observations shall be set by the Monitoring Trustee in a timely manner in order to accelerate the mediation process.
3. Following the exchange of written observations the Monitoring Trustee shall arrange for negotiations between ERI and the third party under his stewardship with a view to reaching an amicable solution of the dispute. Should such negotiations not produce an amicable solution, the Monitoring Trustee is then empowered to recommend a solution which shall become binding upon ERI and the third party unless ERI and / or the third party have lodged its / their opposition to this recommendation within one month from receiving a fully reasoned version of the recommended solution in the English language. In the latter case the Monitoring Trustee shall prepare a report for the Commission on the outcome of the Mediation

process. A copy of this report shall also be provided to the HEO and to ERI and the third party. Nothing in the mediation procedure shall affect the powers of the Commission to take decisions in relation to the Commitments in accordance with its powers under the Merger Regulation and the EC Treaty.

Section E. The Review Clause

The Commission may, where appropriate, in response to a request from ERI showing good cause and accompanied by a report from the Monitoring Trustee:

- (i) Grant an extension of the time periods foreseen in the Commitments, or
- (ii) Waive, modify or substitute, in exceptional circumstances, one or more of the undertakings in these Commitments.

Where ERI seeks an extension of a time period, it shall submit a request to the Commission no later than one month before the expiry of that period, showing good cause. Only in exceptional circumstances shall ERI be entitled to request an extension within the last month of any period. An appropriate extension of the time periods foreseen in this document for the implementation of the gas release programme shall be granted in case the Date of Closing will be after 28 February 2006.

Section F. ERI's full responsibility regarding conditions and obligations involving MOL

ERI shall be fully responsible for procuring MOL to act so as to ensure ERI's full and effective compliance with and implementation of these Commitments.

Duly authorized for and on behalf of ERI

OPINION

**of the ADVISORY COMMITTEE on CONCENTRATIONS
given at its 135th meeting on 6 December 2005
concerning a draft decision relating to
Case COMP/M.3696 – E.ON/MOL**

1. The Advisory Committee agrees with the Commission that the notified operation constitutes a concentration within the meaning of Article 1(3) and 3(1)(b) of the Merger Regulation and that it has a Community dimension as defined by the Merger Regulation.
2. The Advisory Committee agrees with the Commission that for the purpose of assessing the present operation, the **relevant product markets** are in the gas sector:
 - a) Transmission of gas
 - b) Distribution of gas
 - c) Storage of gas
 - d) Supply of gas to traders
 - e) Supply of gas to Regional Distribution Companies (“RDCs”)
 - f) Supply of gas to large power plants
 - g) Supply of gas to large industrial customers (with an hourly consumption exceeding 500 m³/hour)
 - h) Supply of gas to small commercial and industrial customers (with an hourly consumption below 500 m³/hour)
 - i) Supply of gas to residential customers

in the electricity sector:

 - j) Transmission of electricity
 - k) Distribution of electricity
 - l) Provision of balancing power
 - m) Wholesale supply of electricity to traders
 - n) Wholesale supply of electricity to the public utility wholesaler
 - o) Wholesale supply of electricity to RDCs
 - p) Retail supply of electricity to medium and large commercial and industrial customers
 - q) Retail supply of electricity to small commercial and industrial customers
 - r) Retail supply of electricity to residential customers
3. The Advisory Committee agrees with the Commission that for the purpose of assessing the present operation, the **relevant geographic markets** are **national** for the following markets
in the gas sector:
 - a) Transmission of gas
 - b) Storage of gas

- c) Supply of gas to traders
- d) Supply of gas to RDCs
- e) Supply of gas to large power plants
- f) Supply of gas to large industrial customers (with an hourly consumption exceeding 500 m³/hour)
- g) Supply of gas to small commercial and industrial customers (with an hourly consumption below 500 m³/hour)
- h) Supply of gas to residential customers (after July 2007 when residential customers become eligible)

in the electricity sector:

- i) Transmission of electricity
- j) Provision of balancing power
- k) Wholesale supply of electricity to traders
- l) Wholesale supply of electricity to the public utility wholesaler
- m) Wholesale supply of electricity to RDCs
- n) Retail supply of electricity to medium and large commercial and industrial customers
- o) Retail supply of electricity to small commercial and industrial customers
- p) Retail supply of electricity to residential customers (after July 2007 when residential customers become eligible)

4. The Advisory Committee agrees with the Commission that for the purpose of assessing the present operation, the **relevant geographic markets** are at present **sub-national** for the following markets

in the gas sector:

- a) Distribution of gas
- b) Supply of gas to residential customers until July 2007

in the electricity sector:

- c) Distribution of electricity
- d) Retail supply of electricity to residential customers until July 2007

5. The Advisory Committee agrees with the Commission that the proposed transaction will create a fully vertically integrated entity along the gas and electricity supply chains by combining MOL's almost exclusive control over gas resources and storage and E.ON's strong market positions in the retail supply of gas through its ownership of regional distribution companies in both gas and electricity, and E.ON's activities in electricity generation/wholesale.

6. The Advisory Committee agrees with the Commission that therefore after the transaction, the new entity will have both the ability and incentive to foreclose access to gas for its competitors in the downstream gas and electricity markets.

7. The Advisory Committee agrees with the Commission that the merged entity has a **dominant position** in the following markets in the gas sector:

- a) Supply of gas to traders in Hungary
- b) Supply of gas to RDCs in Hungary
- c) Supply of gas to large power plants in Hungary
- d) Storage of gas in Hungary

-
8. The Advisory Committee agrees with the Commission that the proposed concentration is likely to result in a **significant impediment to effective competition** in the common market or in a substantial part of it and the EEA for the following markets
- in the gas sector:
- a) Supply of gas to large industrial customers in Hungary through the creation of the dominant position
 - b) Supply of gas to small commercial and industrial customers in Hungary
 - c) Supply of gas to residential customers in Hungary (in each of the RDCs' areas separately before July 2007)
- in the electricity sector:
- d) Wholesale supply of electricity to traders in Hungary
 - e) Retail supply of electricity to medium and large commercial and industrial customers in Hungary
 - f) Retail supply of electricity to small commercial and industrial customers in Hungary
 - g) Retail supply of electricity to residential customers in Hungary (in each of the RDCs' areas separately before July 2007)
9. The Advisory Committee agrees with the Commission that the maintenance of cross-shareholdings between MOL and the new entity will allow the new entity to reinforce its foreclosure strategy through its position in the gas storage market and MOL's position in the transmission market.
10. The Advisory Committee agrees with the Commission that the **undertakings** are sufficient to remove the significant impediment to competition in the following markets
- in the gas sector:
- a) Supply of gas to large industrial customers in Hungary
 - b) Supply of gas to small commercial and industrial customers in Hungary
 - c) Supply of gas to residential customers in the Hungarian RDCs' areas (in Hungary after 2007)
 - d) Storage of gas in Hungary
- in the electricity sector:
- e) Wholesale supply of electricity to traders in Hungary
 - f) Retail supply of electricity to medium and large commercial and industrial customers in Hungary
 - g) Retail supply of electricity to small commercial and industrial customers in Hungary
 - h) Retail supply of electricity to residential customers in the Hungarian RDCs' areas (in Hungary after July 2007)
11. The Advisory Committee agrees with the Commission that, subject to full compliance with the undertakings offered by the parties, and considered all undertakings together, the proposed concentration does not significantly impede effective competition in the common market or in a substantial part of it, in particular as a result of the creation or strengthening of a dominant position, within the meaning of Article 2(2) of the Merger Regulation and that the proposed concentration is therefore to be declared compatible with Article 2(2) and 8(2) of the Merger Regulation and Article 57 of the EEA Agreement.

12. The Advisory Committee asks the Commission to take into account all the other points raised during the discussion.

EUROPEAN COMMISSION

The Hearing Officer

FINAL REPORT OF THE HEARING OFFICER
IN CASE COMP/ M.3696 – E.ON/MOL

**(pursuant to Articles 15 and 16 of Commission Decision (2001/462/EC, ECSC)
of 23 May 2001 on the terms of reference of Hearing Officers
in certain competition proceedings – OJ L162, 19.06.2001, p.21)**

On 2 June 2005, the Commission received a notification of a proposed concentration pursuant to Article 4 of Council Regulation (EC) No 139/2004 of 20 January 2004 (“the Merger Regulation”) whereby the German group E.ON intends to acquire sole control over the gas wholesale, marketing and trading activities as well as gas storage activities of MOL Hungarian Oil and Gas Company Rt. (“MOL”, Hungary). Furthermore, E.ON intends to acquire MOL’s 50% shareholding in Panrusgáz, a joint venture between MOL and Gazexport (a subsidiary of Gazprom).

At the end of the first phase of the investigation, the Commission concluded that the concentration raised serious doubts as to its compatibility with the common market and with the EEA Agreement. In particular, the transaction was found to have significant impact on the gas and electricity sector in Hungary, given that MOL has an almost exclusive control over the procurement of gas (imports and domestic production) and therefore enjoys a gatekeeper position for access to gas resources and to the gas infrastructures in Hungary.

On 7 July 2005, the Commission therefore initiated proceedings in accordance with Article 6(1)(c) of the Merger Regulation.

On 20 July and 2 August 2005, E.ON was provided with access to the “key documents” in the Commission file in accordance with chapter 7.2. of the “Best Practices on the conduct of EC merger control proceedings”.

On 2 August 2005, the procedure was suspended for eight days pursuant to Article 10(4) of the Merger Regulation owing to the fact that E.ON did not respond in a comprehensive and timely manner to a decision requiring information pursuant to 11(3) of the Merger Regulation.

A statement of objections was sent to E.ON on 19 September 2005. As agreed between E.ON and MOL, a version of the SO without E.ON's business secrets was transmitted to MOL by E.ON's legal representatives. In the following days, access to the Commission’s file was granted. E.ON and MOL were given the opportunity to comment on the Commission’s preliminary findings as set out in the statement of objections by 3 October 2005. This deadline was subsequently extended to 6 October 2005 at the parties’ request. E.ON’s reply was received on 5 October 2005.

The parties did not request to develop their arguments in a formal oral hearing.

On 21 October 2005, I granted the request of Energie Baden-Württemberg AG to be admitted as an interested third party. The same day, the Commission sent them a non-confidential summary of the statement of objections.

On 20 October 2005, E.ON offered commitments which were amended on 11 November and on 16 November 2005 respectively. Further to the market testing of the proposed undertakings, E.ON substantially improved their draft commitments, in particular as regards the duration of the gas release program and the price mechanism of the gas release auctions.

I have not been asked to verify the objectivity of the enquiry.

In agreement with and following an express request by the parties, the Commission issued a decision on 10 November 2005 pursuant to article 10(3) second paragraph of the Merger Regulation in order to extend the procedure by 11 working days.

In the light of the commitments eventually proposed and having analysed the results of the market test, the draft decision concludes that the proposed concentration is compatible with the common market and with the EEA Agreement.

In the light of the above, I consider that the rights to be heard of all participants to the present proceeding have been respected.

THE COMMISSION OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Community,

Having regard to the Agreement on the European Economic Area, and in particular Article 57 thereof,

Having regard to Council Regulation (EC) No 139/2004 of 20 January 2004 on the control of concentrations between undertakings¹, and in particular Article 8(2) thereof,

Having regard to the Commission's decision of 8 December 2006 to initiate proceedings in this case,

Having regard to the opinion of the Advisory Committee on Concentrations,

Having regard to the final report of the Hearing Officer in this case,

WHEREAS:

I. INTRODUCTION

1. On 3 November 2006, the Commission received a notification of a proposed concentration pursuant to Article 4 of Regulation (EC) No 139/2004 ("the Merger Regulation") by which the undertaking Universal Music Group Inc. ("Universal") acquires within the meaning of Article 3(1)(b) of the Merger Regulation sole control of the whole of the undertaking BMG Music Publishing ("BMG") which currently forms part of the Bertelsmann group, by way of purchase of shares and assets. Universal and BMG are collectively referred to in this decision as "the parties" with Universal alone being the "notifying party".
2. After examination of the notification, the Commission has concluded that the operation falls within the scope of the Merger Regulation and threatens to significantly impede effective competition in the common market. It therefore decided on 8 December 2006 to initiate proceedings pursuant to Article 6(1)(c) of the Merger Regulation.

¹ OJ L 24, 29.1.2004, p. 1

3. On 15 March 2007, Universal offered commitments with a view to rendering the concentration compatible with the common market. These commitments were modified on 26 March 2007 and improved on 30 March 2007. The final version of the commitments was submitted on 23 April 2007.
4. The Commission has concluded that the commitments entered into by Universal remove the serious doubts as to the compatibility of the notified operation with the common market. The concentration is therefore to be declared compatible with the common market and the functioning of the EEA Agreement pursuant to Articles 8(2) and 10(2) of the Merger Regulation and Article 57 of the EEA Agreement.

II. THE PARTIES

5. Universal is a 100% subsidiary of Vivendi SA ("Vivendi"). It is an international media company and its world-wide activities include music recording and publishing. Universal is active in music publishing through Universal Music Publishing Group ("UMPG").
6. BMG is part of the Bertelsmann group ("Bertelsmann") which is an international media company. BMG comprises the worldwide music publishing and production music activities of Bertelsmann.

III. THE CONCENTRATION

7. On 6 September 2006 Vivendi and Universal signed a share purchase agreement with Bertelsmann AG and seven further companies within Bertelsmann for the acquisition of BMG. As a result of the transaction Universal will acquire sole control of BMG. The transaction therefore constitutes a concentration within the meaning of Article 3(1)(b) of the EC Merger Regulation.

IV. COMMUNITY DIMENSION

8. Vivendi and BMG have a combined aggregate worldwide turnover of more than EUR 2 500 million (EUR 19 484 million for Vivendi in 2005 and EUR [...] for BMG in 2005). The aggregate Community wide turnover of each party exceeds EUR 100 million (EUR [...] for Vivendi in 2005 and EUR [...] for BMG in 2005).
9. The aggregate turnover of all the undertakings concerned exceeds 100 million in more than three Member States, namely France (Vivendi: EUR [...]*, BMG: EUR [...]*), Germany (Vivendi: EUR [...]*, BMG: EUR [...]*), Italy (Vivendi: EUR [...]*, BMG: EUR [...]*) and the United Kingdom (Vivendi: EUR [...]*, BMG: EUR [...]*). The aggregate turnover of each of Vivendi and BMG is more than EUR 25 million in all of these Member States.

* Parts of this text have been edited to ensure that confidential information is not disclosed; those parts are enclosed in square brackets and marked with an asterisk.

10. The Parties do not achieve more than two-thirds of their turnover in one and the same Member State. The notified operation therefore has a Community dimension pursuant to Article 1(3) of the Merger Regulation.

V. RELEVANT MARKETS

1. Relevant product markets

11. Both parties are active in the music publishing business. The Commission identified in the case *Sony/BMG*² that the main activities of a music publisher comprise the discovery and identification of new talented songwriters with a view to acquiring and commercially exploiting their intellectual property rights and the provision of financial and promotional support to authors, arranging for music recordings and supporting their dissemination.
12. Music publishing is the exploitation of intellectual property rights of song writers (in this decision the term "authors" will be used to cover both lyricists (text) and composers (music)). Generally, authors transfer copyright of their works (referred to in this Decision as "publishing rights") to music publishers and receive from the latter payments of advances and a share of the royalties generated by the commercial exploitation of their works. The term "transfer of rights" refers both to the assignment and licensing of copyright.³
13. While the Commission in past merger cases mainly focussed on the music publishing market on which publishers grant licences to right-users, such as to producers of movies, record companies or radio stations, it appears that another market level to be taken into consideration would be the one covering the supply of publishing services to authors.
14. The activities of a publisher are thus twofold: on the one hand, the downstream activity of exploiting the works of authors under contract, inter alia by means of licensing the rights through the collecting societies, and on the other hand an upstream activity of signing authors and providing them with financial and marketing support as a counterpart to the transfer of their musical works. It appears that these two activities relate to separate markets as each one implies a distinct supply and demand relationship (between publishers and final users downstream, and between authors and publishers upstream).

² Case No COMP / M.3333 – Sony/BMG, 19 July 2004.

³ An assignment of copyright is the absolute (except for moral rights) transfer of the copyright ownership from one person (an "assignor") to another (an "assignee"). Usually, an assignment contains no restrictions as to the subsequent exploitation of the work by the assignee. A licence of copyright is a contractual right or permission whereby the copyright owner (the "licensor") allows another person (the "licensee") to exercise particular rights under copyright for a specified term. Unlike an assignment, a licence is not an absolute grant of rights and legal title does not pass to the licensee. It is a contractual right that usually ends on expiry of the term or upon termination of the licence. On expiry or termination of the licence, all rights granted under it, including under any sub-licences, revert to the licensor. The precise conditions under which copyright is transferred may differ in each country. In the Decision, the term "transfer" will be used encompassing both the assignment and the licensing of rights by authors to publishers / collecting societies while "licensing" will mainly refer to the exploitation of these transferred rights by publishers / collecting societies granting licences to users.

1.1 Markets for the exploitation of music publishing rights (downstream market level: publisher - user)

15. Music publishers exploit the rights received from authors by granting licences to right-users. The right-users encompass all sectors where music is required (CDs, films, advertising, radio, TV, internet and mobile communications)⁴. The users pay royalties for the use of these musical works. Depending on the specific types of rights, the licences are granted to right-users either by the publishers directly or via collecting societies.

Combination of recording and publishing

16. Publishing rights (i.e. the rights originally held by authors) need to be distinguished from so-called "neighbouring rights" or "recording rights" which mainly protect the individual interpretation of a song by a performing artist. While the publishing rights of a song are with the authors and their publishers, the recording rights are with the recording companies and the singers who normally transfer them to their record companies.
17. In order to legally use a song, for example on the radio, or for downloading services on the internet, a music user in most cases has to acquire a licence for both the publishing right and the recording right. The lack of either of these prevents legal use of the song.

Types of publishing rights

18. The following different types of rights⁵ exist, each of which might constitute a distinct product market as they are commercialised through distinct channels, address different needs and apply for different uses:
 - i. **mechanical rights**: for reproduction of a work in a sound recording (e.g. CDs);
 - ii. **performance rights**: for commercial users such as broadcasters (TV or radio stations), concert halls, theatres, night clubs, restaurants etc.;
 - iii. **synchronisation rights**: for commercial users such as advertising agencies or film companies (i.e. when the music is synchronised with the visual image);
 - iv. **print rights**: for the reproduction of work in sheet music.

⁴ The publishing business has no direct relationship with final/end consumers and can therefore be considered as a wholesale market.

⁵ This categorization broadly covers the rights indicated in the Directive 2001/29/EC of the European Parliament and of the Council of 22 May 2001 on the harmonisation of certain aspects of copyrights and related rights in the information society (Official Journal L 167, 22/06/2001). The "reproduction right" covers mechanical and synchronization rights, the "right of communication to the public" includes also a "making available right" which relates to communication to the public where the public may access the works from a place and at a time individually chosen. This makes particular reference to downloading and streaming.

19. **Online rights** are a fifth category of rights to be considered. They constitute a specific combination of mechanical and performance rights for online applications, such as music downloading services.
20. The parties are of the view that a segmentation of the market by categories of rights is not necessary as it would not reflect the commercial realities of the music publishing industry. According to the parties, music publishers do not distinguish for operational purposes between separate categories of rights but administer all the different categories in respect of a particular song or composition and authors generally contract with a publisher to exploit *all* their rights rather than one category of rights.
21. In its decision in *Sony/BMG* (as in *Seagram/Polygram*⁶), the Commission stated that the exploitation according to the different types of rights may lead to the definition of separate product markets for each categories of rights, although the precise market definition was left open in that regard. Both demand-side (different characteristics of rights relating to different customer needs) and supply-side considerations (existence of different exploitation systems, application of dissimilar licensing rates) backed this statement.
22. From a demand-side perspective there is clearly no substitutability between the different categories of rights. A radio station needing a licence to play music on the radio (performance right) will not be able to take a licence for reproduction on CDs (mechanical right) instead.
23. The assumption of one overall market for publishing rights does not seem to be appropriate from a supply-side perspective either. While publishers often administer not only specific rights but several or even all of the authors' rights, the market investigation in this case has nevertheless shown that the market conditions differ significantly as to the different rights, which points to separate markets.
24. The main differences relate to the role of the collecting societies. It is worthwhile noting that licensing of mechanical and performance rights (which generate the largest share of revenues) are generally carried out by collecting societies⁷ on behalf of publishers and/or authors while synchronization and print rights are generally licensed and administered directly by the publishers without involvement of collecting societies. There are also differences in the way royalties are paid by users to the relevant collecting societies; for example, in the case of mechanical rights for Continental Europe, there is a standard rate whereas for performance rights rates are negotiated by each collecting society. In some countries, there are even separate collecting societies for mechanical and performance rights (e.g. Austria, United Kingdom and Sweden). The market investigation has confirmed that the licensing conditions differ per category of rights.
25. Therefore the product markets for publishing rights need to be defined according to the specific fields of application (mechanical, performance, synchronisation, print and online)

⁶ Case No IV/M.1219 – Seagram/Polygram, dated 21 September 1998.

⁷ The collecting societies generally sign agreements with all publishing companies, which allow the collecting society to grant a blanket licence (including repertoires from all publishing companies) on a non-discriminatory basis. Therefore all end users have a full and non-discriminatory access to musical works.

for which the rights are used since the prices as well as the overall economic conditions differ significantly.

Online rights

26. Among the five right categories mentioned above, specific considerations apply to online rights. The notifying party submits that there is no separate right for the online distribution of music but that these digital rights are merely a combination of mechanical and performance rights. Although the market investigation has shown that in most national laws online rights are not defined as a distinct legal right, it also demonstrated that competitive conditions for online applications differ from the other categories of rights. Online rights therefore constitute a distinct product market.
27. Online rights apply to a wide range of applications. All these online and mobile applications have in common that they require a licence combining both mechanical and performance rights.⁸ At present, the most important online and mobile music services, in terms of revenues generated, are (in systematic order):
- *On-line (audio) download:*
recording of music on the user's computer and the possibility (potentially limited by Digital Rights Management ("DRM")) to transfer it on other devices and to make copies;
 - *On-line (audio and video) streaming:*
temporary listening or viewing of music on the user's computer without recording;
 - *Mobile (audio) download:*
recording of music on the user's mobile device by wireless transmission, in particular a mobile phone;
 - *Mobile (audio and video) streaming*
temporary listening or viewing of music, without recording, on the user's mobile device by wireless transmission, in particular a mobile phone;
 - *Ringtones*
melodies, i.e. without lyrics, which are played as ringing signal of a mobile phone, in particular for incoming calls; ringtones may be monophonic or polyphonic melodies;
 - *Mastertones*
ringtones embodying sound recording excerpts, i.e. songs (melody and lyrics) used as ringing signal of a mobile phone, in particular for incoming calls;
 - *Ringbacktones*
songs or melodies played for the call initiator until the phone is answered.

⁸ Cf. paragraph 105 of the form CO.

28. There are many different business models for these music services: Some are advertisement-financed and thus free of charge for users; publishing royalties for these services are usually calculated as a percentage of the advertising revenues. Other services are integrated into a subscription model with the publishing royalties being calculated on the basis of the subscription revenues. Finally, many services are billed on the basis of the number of titles or tones downloaded; for these services publishing royalties are calculated as a percentage of the retail price or as a minimum fee per track. The importance of the various music services for the individual provider depends on its main business areas, e.g. for a pure mobile phone operator ringtones, mastertones and other mobile applications are most important whereas other providers such as Apple i-tunes focus on online downloads. However, it is also noteworthy that the convergence of online and mobile technologies increasingly blurs any clear borderline between online and mobile applications. This convergence applies in particular to downloading and streaming applications whereas mastertones, ringtones and ringbacktones are mobile-specific.⁹
29. Despite this convergence trend, a further distinction within the online rights category between online and mobile applications could be argued as from the demand side there is a limited substitutability. However, for the purpose of this case, such a further distinction would not be necessary as the competition analysis would remain unchanged under any distinction considered.
30. The delineation of online rights as a distinct market is furthermore supported by the following elements.
31. The Commission Recommendation of 18 May 2005 on collective cross-border management of copyright and related rights for legitimate online music services¹⁰ (the "Recommendation") singles out online rights in order to foster effective structures for the cross-border management of these rights. It defines online rights as: "(i) the exclusive right of reproduction provided for under Directive 2001/29/EC in the form of intangible copies, made in the process of online distribution of musical works; (ii) the right of communication to the public of a musical work, either in the form of a right to authorise or prohibit pursuant to Directive 2001/29/EC or a right to equitable remuneration in accordance with Directive 92/100/EEC, which includes webcasting, internet radio and simulcasting or near-on-demand services received either on a personal computer or on a mobile telephone; (iii) the exclusive right of making available a musical work pursuant to Directive 2001/29/EC, which includes on-demand or other interactive services".¹¹

⁹ In some countries (e.g. Germany), mastertones, ringtones and ringbacktones require an additional licence for so-called adaptation rights, a kind of moral right of the author. These adaptation rights are currently licensed directly by the publishers without involvement of the collecting societies.

¹⁰ OJ L 276, 21.10.2005, p. 54.

¹¹ Commission Recommendation of 18 October 2005 on collective cross-border management of copyright and related rights for legitimate online music services (2005/737/EC), point 1(f) (i) to (ii). See also Directive 2001/29/EC of the European Parliament and of the Council of 22 May 2001 on the harmonisation of certain aspects of copyright and related rights in the information society, [2001] OJ L 167/10 and Council Directive 92/100/EEC of 19 November 1992 on rental right and lending right and on certain rights related to copyright in the field of intellectual property [1992] OJ L346/67.

32. Universal itself considers¹² that online rights include telephone and online usage rights including reproduction, distribution and moral rights (synchronisation rights are excluded), telephone and online usage meaning mainly exploitation of musical works through downloading¹³ and streaming (simulcasting¹⁴ excluded). As far as BMG is concerned, online usage means online and mobile usage including ringtones and web casting (simulcasting excluded)¹⁵.
33. From a demand-side perspective there is no substitutability between online rights and traditional mechanical and performance rights since licences are granted for a specific application. The prices are defined according to different rules from the traditional mechanical and performance rights.
34. Since online applications are a comparably new development, there has been some uncertainty about the rules which apply to these rights on the part of the market participants. For instance some collecting societies have established specific rules as to online rights which were inserted into the collecting societies' statutes and thereby define distinct rules.
35. The market conditions under which online rights are licensed are, moreover, currently changing which further widens the gap between them and the traditional mechanical and performance rights. Thus, since the beginning of 2006, there have been some attempts (see in more detail further below) to turn the current system of collective management of rights (where all collecting societies, each enjoying a dominant position on its own territory, are dealing with equivalent rights through reciprocal agreements) into a system where a limited number of collecting societies are granted exclusivity in the management of online rights belonging to some publishers. This will distinguish online rights even more clearly from other rights since very specific rules will apply to online rights. So far, such a change mainly relates to the management of online mechanical rights (see below). Without it being necessary to determine whether the management of online mechanical rights constitutes a separate market from the wider online right market, the competitive assessment will focus on this segment as the conclusion will remain unchanged irrespective of whether the relevant product market is considered to be the overall online rights market or the online mechanical rights segment.

¹² This definition of the online right was provided by Universal to the Collecting Societies [...]*

¹³ It is often considered that downloading involves to 75% mechanical rights due to the storage of the song on a hard-disk which is comparable to a CD and to 25% performance rights since the online music provider normally offers to the end-customers the possibility to listen to parts of the songs before buying them.

¹⁴ Contraction of "simultaneous broadcast", and refers to programs or events broadcast across more than one medium at the same time.

¹⁵ In the same way, it can be also observed that the mechanical rights British collecting Society MCPS indicates on its website that "*online rights shall include online and mobile usage rights including, as regards the performing right, any right to communication to the public and as regards the mechanical right, to the extent possible, reproduction, distribution [...]*".

Anglo-American and Continental Europe repertoires

36. Apart from the categories of rights, the notifying party considers as a theoretically possible product market a segmentation of national and international¹⁶ repertoires for music publishing. A "repertoire" is the entirety of a number of titles, i.e. songs which may also be called works. However, the notifying party submits that a distinction between separate markets for national and international repertoires would not be justified.
37. The market investigation indicated that "Anglo-American" repertoire (i.e. titles registered with the collecting societies mainly in the U.S. (BMI and ASCAP) and the United Kingdom (MCPS and PRS)) may be distinguished from "Continental European" repertoire¹⁷ (i.e. titles registered with collecting societies in Continental Europe such as GEMA in Germany or SACEM in France). Anglo-American and Continental European repertoire differ for historical reasons (as explained in detail below). In addition, Continental European repertoire is largely commercialised on a national basis whereas Anglo-American repertoire relates to works acquired and exploited on a multi-national basis.
38. However, as will be explained in more detail later-on, the main difference between the Anglo-American and Continental European repertoire is the fact that publishers do not share the same level of control over the mechanical rights concerned: for Anglo-American repertoire, the publisher holds full control of the mechanical rights (which are transferred by the author to the publisher) whereas for Continental European repertoire a share is kept by the author. Hence, the management of the Anglo-American repertoire will in the future (after the reorganisation of the online rights market as discussed in more detail below) follow different rules from Continental European repertoire. For instance the mechanical British collecting society (MCPS) notably pays 100% of the royalties collected to publishers whereas Continental European collecting societies pay only a share of collected royalties to publishers, the other share being directly paid to authors.
39. On the other hand, both Continental European and Anglo-American repertoires address similar customers and follow the same market rationale. Major publishers generally have a strong position for Anglo-American repertoire compared to independent publishers who often appear to focus rather on specific genres and/or territories.
40. It is however not necessary to assess whether Anglo-American mechanical rights for online use could in the future constitute a separate market since the competitive assessment would not change. The current assessment is based on Universal's future market strength in Anglo-American repertoire on the overall online rights market (including Anglo-American and other titles). Even under the assumption of a separate market for Anglo-American titles (for online use) the market analysis would not be different.

¹⁶ The international repertoire corresponds mainly with the Anglo-American repertoire (i.e. US/Canada, United Kingdom/Ireland, Australia/New Zealand) whereas the national repertoire will refer to the Continental European repertoire.

¹⁷ As a synonym also the term BIEM repertoire is used.

Musical genres

41. In its previous cases the Commission also considered that the market might be delineated by different genres/categories of music. The basic segmentation generally referred to applies to pop versus classical music. However, in *Seagram/Polygram* and *Thorn EMI/Virgin* the Commission held that within pop music a large number of different categories could be identified (e.g. jazz, soul, heavy metal and techno). So far, however, the Commission has left the precise scope of the relevant product market open¹⁸.
42. The parties submit that music publishers usually acquire and commercialize rights for several types of music, while users will generally license rights covering a wide variety of genres. For this reason the parties consider that no distinction should be made between genres with regard to the product market definition. Even if a number of independent publishers specialize in one specific genre (niche strategy), this view is generally confirmed by the market investigation, with a possible exception for classical music.
43. However the question whether different genres may lead to the definition of separate product markets can be left open as the competitive analysis will remain unchanged under any envisaged definition.

Conclusion

44. For the reasons explained above, a definition of the market along the lines of different categories of rights is appropriate since the economic conditions seem to differ mostly between these categories. The precise definition of the market for music publishing rights for online applications with respect to a potential further sub-division into "mobile" and "online (excluding mobile)" can be left open as the effects of the transaction will be the same under both market delineations. The market for music publishing rights for online and mobile applications will hereinafter be referred to *pars pro toto* as the "market for online rights".

1.2 Market for music publishing services to authors (market level: author - publisher)

45. The author-publisher market level refers to the market on which publishers provide the authors with various services such as advances, management and administration of copyrights. Apart from this, publishers provide services to authors which serve the promotion and further development of the author. The parties describe those as "A&R" (Artist and Repertoire) services, which include for example the finding of producers, the provision of creative guidance and career development and suggestions of suitable writing partnerships with other authors. In return the authors transfer the rights connected to their own works to the publishers for exploitation. The business relation between authors and publishers is therefore partially characterised by a form of barter trade. Authors receive services for transferring their rights to publishers (either by assignment or by licence). While from the perspective of publishers this market level constitutes a market for the acquisition of rights, from the viewpoint of authors it constitutes a market for publishing services.

¹⁸ Case No IV/M.202 – Thorn EMI/Virgin, dated 27.04.1992 ; Case No IV/M.1219 – Seagram/Polygram, dated 21.09.1998.

46. Generally, authors license copyrights of their works to music publishers and receive from the latter payments of advances and a share of the royalties generated by the commercial exploitation of their works. The advances usually have the character of a loan since all royalties which are earned by licences to users go to the publisher until the advances are amortised. The publisher carries the risks if the advances are not fully amortised. Only then does the author receive the share of royalties as agreed with the publisher. A minority of authors do not rely on publishers' services and publish their works themselves. This can in particular be viable for established authors thanks to the existence of collecting societies who collect mechanical and performance royalties on behalf of the author.
47. For those working with a publisher, the licensing is based on an individual contract between the parties, where the publisher will administer the copyright of the author for a duration which varies between several years to the lifetime of the copyright (70 years after the death of the author). The most frequent situation is lifetime of copyrights with however some shorter term contracts signed in the recent past (e.g.: contract of 5 years plus a retention period of 10 years – meaning that the publisher will administer all rights for works created during the 5-year contract for a period ending 10 years after termination of the contract).
48. Authors should therefore not only be considered as suppliers of songs, but also as customers receiving various publishing services. For new authors principally, a publisher usually provides strategic support to start a career as it gives the author initial financial support and access to its established network of artists and record companies. More generally the administrative support of publishers allows authors to focus on creative activities. The market investigation confirms that many authors would not envisage working without a publisher.
49. It is relatively common for authors to work with different publishers who each administer different works. It is generally observed that one author can work with different publishers during different periods, each publisher administering the rights of the works created during the period in respect of which he had a contract with the author. However, authors do not seem to use different publishers for the different categories of rights. Therefore, in contrast to the considerations for the market for publishing rights (downstream level) no further segmentation of this market appears to be appropriate. In this Decision, a market for music publishing services for authors will be assumed.

2. Relevant geographic markets

2.1 Markets for the exploitation of music publishing rights (downstream market level: publisher - user)

50. The notifying party considers the geographic scope of the market for the exploitation of music publishing rights granted to right-users to be essentially national in scope and refer to the Commission's considerations concerning the geographic market in music publishing in the *Sony/BMG* decision.
51. In *Thorn EMI/Virgin Music* and *Seagram/PolyGram*, the Commission left open the question as to whether the geographical scope of the music publishing market(s) was

national or broader, in particular EEA-wide. In *Bertelsmann/Zomba*¹⁹ and *Sony/BMG* the Commission concluded that there were indications that the markets for mechanical and performance rights were national as these rights were generally administered and collected by national collecting societies on behalf of the publishers and/or authors. In addition, it was found that all publishers who wish to diffuse their repertoire outside their home country rely on local agencies implanted in the target country or sub-publish their repertoire to a publisher established in the target country. However the exact geographic scope of the market was left open.

52. The concept of national markets might be mitigated by major recording companies having signed so-called central licensing agreements for mechanical rights. This type of licensing agreement is signed with a selected collecting society who then grants licences for the European territory by negotiating itself with the individual national collecting societies.
53. However although this central licensing allows for a one-stop-shop for record companies, it is basically a centralised system of reporting of national sales and still involves activities of all national collecting societies in their respective territories.
54. As regards print and synchronisation rights, the scope of the licences obtained by the customers is usually national even if this could depend on the use foreseen (for instance a TV advertisement broadcast in several countries).
55. Moreover the market investigation confirms that publishers are generally active on their national market, or work with a local partner on foreign markets. Mostly, publishers work in different countries by having either own representations there or agreements with local sub-publishers to exploit their catalogues in the foreign countries.
56. There is no need to strictly define the geographic scope of the markets for mechanical, performance, synchronisation or print rights as the competitive assessment will remain unchanged, irrespective of whether the market was considered to have a national or EEA-wide dimension.
57. As regards more particularly online rights, and as mentioned above, the administration of online rights has so far been done by the collecting societies which in the traditional system work on a strictly national basis granting licences only for their respective national territory to national users. Therefore, currently the market is national.
58. A significant restructuring of online rights administration is currently taking place (this will be explained in more detail below) which may lead to an EEA-wide licensing of online rights. Where these restructuring initiatives have advanced already, they currently simply replicate the national licensing system on the basis of so-called "country of destination" tariffs. Even in this case, the market would therefore still be considered as a national market.
59. However, some of the current initiatives, where publishers appoint one (or more) collecting societies to manage and administer the online rights for mobile and online uses as the publisher's agent, aim at developing this activity throughout Europe, applying a foreseen single tariff. It is therefore possible that the market may eventually develop an EEA-wide scope.

¹⁹ Case No COMP / M.2883 Bertelsmann/Zomba.

60. The relevant geographic dimension of the online rights markets assessed will therefore mainly relate to the national markets where the transaction raises competition concerns. However, in order to take into account the developing restructuring initiatives and their likely impact on competition, a complementary assessment at the EEA-wide level will be undertaken. The conclusions remain unchanged under both geographical scopes.

2.2 Market for music publishing services for authors (upstream market level: author-publisher)

61. The geographic scope of the market for publishing services provided to authors appears to be national as authors mainly seem to turn to publishers with local presence and are members of the national collecting societies. The exact geographic scope may, however, be left open since the conclusions of the analysis will be the same, irrespective of the geographic dimension of the market.

2.3 Conclusion on market definitions

62. The competitive assessment will therefore examine the impact of the merger on the following markets:
- markets for publishing services for authors (on a national level)
 - market for synchronization rights (on national and EEA level)
 - market for print rights (on national and EEA level)
 - market for mechanical rights (on national and EEA level)
 - market for performance rights (on national and EEA level)
 - market for online rights (on national and EEA level)

VI. COMPETITION ASSESSMENT

A. MARKET FOR MUSIC PUBLISHING SERVICES FOR AUTHORS

1. Market structure

63. The market structure of the market for music publishing services is mirrored in the market for the exploitation of publishing rights. The authors choose a publisher for the provision of music publishing services which cover the promotion and exploitation of their songs. The revenues received by exploiting these rights (directly or via collecting societies) are shared between the publishers and the authors.
64. While some deviations are possible due to different splits between authors and publishers, it is likely that the market shares of the music publishing services are similar to their market shares on the downstream market(s) for the exploitation of publishing rights vis-à-vis the users. Basically the same market structure prevails in this market as for the overall market for music publishing rights (including mechanical, performance, print, synchronization and online rights) as summarized in the following table (source: parties' estimates):

Market share estimates for a market covering all publishing rights (2005)

All rights	Universal	BMG	Merged	EMI	Warner	Sony	Others
	%	%	%	%	%	%	%
Austria	[10-20]*	[0-10]*	[20-30]*	[20-30]*	[10-20]*	[0-10]*	[20-30]*
Belgium	[10-20]*	[0-10]*	[10-20]*	[20-30]*	[10-20]*	[0-10]*	[20-30]*
Czech Rep.	[0-10]*	[0-10]*	[10-20]*	[30-40]*	[20-30]*	[0-10]*	[10-20]*
France	[10-20]*	[10-20]*	[20-30]*	[10-20]*	[10-20]*	[0-10]*	[30-40]*
Germany	[0-10]*	[10-20]*	[20-30]*	[20-30]*	[10-20]*	[0-10]*	[30-40]*
Greece	[10-20]*	[10-20]*	[30-40]*	[20-30]*	[20-30]*	[10-20]*	[0-10]*
Hungary	[20-30]*	[20-30]*	[40-50]*	[20-30]*	[10-20]*	[10-20]*	[0-10]*
Italy	[0-10]*	[10-20]*	[20-30]*	[10-20]*	[10-20]*	[0-10]*	[40-50]*
Netherlands	[10-20]*	[10-20]*	[20-30]*	[20-30]*	[10-20]*	[0-10]*	[10-20]*
Poland	[10-20]*	[10-20]*	[30-40]*	[10-20]*	[10-20]*	[10-20]*	[10-20]*
Spain	[10-20]*	[10-20]*	[20-30]*	[10-20]*	[10-20]*	[0-10]*	[20-30]*
United Kingdom	[10-20]*	[10-20]*	[20-30]*	[20-30]*	[10-20]*	[0-10]*	[20-30]*
EEA	[10-20]*	[10-20]*	[20-30]*	[10-20]*	[10-20]*	[0-10]*	[30-40]*

Source: Parties' estimates

65. The operation would thus give rise to horizontally affected markets on an EEA-wide level and in the EEA-countries Austria, Belgium, Czech Republic, France, Germany, Greece, Hungary, Italy, the Netherlands, Poland, Spain and the United Kingdom.

2. Non-coordinated effects

66. The parties submit that there is strong competition between publishers to sign and develop new artists since the large, vertically integrated major publishers ("majors": Universal, BMG, EMI, Warner, Sony) equally compete against each other and against the smaller independent publishers ("independents"). However, during the market investigation some concerns were raised by authors in respect of the merger which mainly pointed at potential non-coordinated effects resulting from the merger.

Impact of size of catalogue on the quality of services to authors

67. Some market participants raised the concern, that the larger the catalogue, the more difficult it is for the publisher to have detailed knowledge of each work, its characteristics and its potential. Majors who have much larger catalogues than independents are therefore reputed to bring more attention to a limited number of successful works and authors to the detriment of less successful ones. The independents generally have the reputation of better supporting authors and paying more attention to the development and commercial exploitation of their works.
68. Several market players submitted that, like previous mergers in the music publishing industry, the proposed merger is likely to result in a reduction of staff if compared with current Universal and BMG staff in charge of promotion of publishing rights. As a consequence, the same number of works would be managed by less people, therefore

ensuring a lower quality of service to authors. As a result, authors expect that the number of authors/works actively supported by Universal/BMG after the merger will decrease²⁰.

69. However, the investigation has ultimately not confirmed that the merger will lead to competition concerns on these grounds. Competition between the publishers for authors takes place when an author is looking for a publisher. Competition therefore becomes relevant at the time when an author signs a contract. At that time, the author can choose between the different publishers – he is, however, "locked in" after having signed for the duration of the contract according to the terms he agreed upon when signing. Promotional services of lower quality are therefore not a lack of effective competition since the author may choose between different publishers only at the time when a contract is signed, whilst the concern indicated in the market investigation mainly relates to business relations between authors and publishers once the author is "locked in" and may not be able to sufficiently influence the quality of the services provided by the publisher.
70. Authors have claimed that the contractual obligations of the publisher are rather vague. A "best effort" is often required to promote the works concerned, which does not lead to clear actions to be undertaken by the publishers with respect to the contract. The consequence is that it is difficult for an author to challenge the publisher with regard to its effective support for his works. The merger would, however, only raise competition concerns if the authors would be left with significantly reduced possibilities to switch to a different publisher after the expiry of the contract as a consequence of the deterioration in the promotional services. The market investigation has, however also not supported this second claim.²¹

Impact on the choice of authors to sign publishers

71. During the market investigation the concern was raised that the merger could reduce the authors' choice to an extent which would lead to a significant impediment of competition. It was argued that majors and independents have a different business focus which limits their substitutability.
72. Majors and independents have different characteristics with regard to their relationship with authors. Majors have the reputation of focusing more on renowned authors. They have a capacity to provide larger advances and promote international hits. Independents have the reputation to focus more on new authors to whom they propose tailor-made support. They also pay higher royalty rates. Independents often explore new trends and styles, which once successful are further developed and exploited by majors.

²⁰ Questionnaire to authors associations – phase 2. **Q 11a**

²¹ A proxy to measure how a catalogue is exploited is to calculate the average revenue per work. This analysis does not show any evidence that smaller catalogues enjoy a better exploitation as measured in terms of revenue per work. Majors even enjoy larger average revenue per work, which might however be explained by the larger proportion of international hits in their catalogues. (The average revenue per work is 3 to 4 times higher for the major publishers (EUR 300-600 per work) than for independents (EUR 50-200 per work). A few large and international independents reach the level of revenue of the majors.) The same analysis conducted only on independents' catalogues does not either provide evidence of a better exploitation of smaller catalogues. (When considering independents only, the revenue per work varies from EUR 50 to EUR 200 per work and is not correlated to the size of catalogue.)

73. Authors claimed that after the merger of Universal and BMG, their choices to sign a major will decrease and raise competition concerns. However these concerns are not confirmed by the market investigation. The competition to sign authors appears to be fully effective. Majors and independents actively seek to sign new authors through participation in concerts, music conferences, networking, contacting record companies, developing links with the artistic community, etc.
74. As explained above, majors tend to focus on renowned authors. It is mainly those established authors who will be eligible for large advances whereas the new authors (who are more risky for the publishers) will often not receive such an up-front investment into their future songs. The market investigation has shown indications that the large publishers compete with each other in particular with regard to established authors, generally through direct negotiation or, in the case of the very successful authors, even through bidding contests.²²
75. After the merger, the authors seeking large advances will still have a choice between four majors (Universal/BMG, EMI, Warner, Sony). In terms of market shares, Universal will be in a leading position after the merger but will be closely followed by EMI and Warner. The existence of at least two comparable publishers leaves sufficient room for switching possibilities should Universal/BMG decide to deteriorate the terms offered to authors following the merger. Apart from the fourth major Sony there are moreover, a few larger independents (e.g. Chrysalis) who are in an intermediary position and can also compete for renowned authors through the payment of large advances. The market investigation has also not shown any tight capacity constraints which would prevent Universal's competitors from signing additional authors who want to leave Universal following the merger when signing a new contract.
76. The market investigation confirms that publishers need to permanently renew their catalogue to maintain its value. This is highlighted by the table below where the active deals are deals where the author is still under contract and continues to produce new works. The percentage of turnover achieved through the exploitation of the works produced under these active deals is significantly higher than the share represented by works produced under active deals. In simplified terms, most recent works generate more revenue than oldest ones. This has been confirmed by majors and independents.

	Active deals		
	Number	%of total number of works	% of total publisher turnover
Universal	[...]*	[<10]*%	[>25]*%
BMG	[...]*	[<30]*%	[>50]*%

Source: Universal/BMG

77. This reflects the necessity for publishers to permanently renew their catalogue. This occurs in two ways: issuing of new works by signed authors and signing of new authors. Publishers, notably majors, therefore have a strong incentive to attract the most promising new authors or established ones, resulting in a competitive market for the signing of

²² Cf. Warner Chappell Music: "[...] it is rare that WCM signs someone who has not also received an offer from at least one other publisher" Questionnaire competitors (majors)1 – Q24.

authors. Independents confirm that they also actively compete to sign authors, even if majors have an advantage in terms of financial capacity and support to develop international hits.

78. The market investigation has moreover shown indications that the retention periods are becoming shorter. The retention period is the time period in which a publisher can exploit a song which was written by the author while under a contract with the publisher. All the majors and about half of the independents who responded to the market investigation indicated that they sign contracts for a shorter period than the life-time of copyright (70 years after death of the author). Half of the independents continue to sign contracts for the life of copyright. This appears to be a significant evolution compared with the situation in the past when, according to the profession, the majority of rights were transferred for the life-time of the copyright. Consequently, the authors' possibilities to switch will not only affect new songs to be written in the future but also, to an increasing extent, older songs for which the retention period expires.
79. The switching possibilities are even greater for those authors who are not seeking large advances. Those authors will still have the possibility to sign a publisher among the majors or all independents, where attractive offers can be found.

Sister companies (publishing & record)

80. The majority of independent competitors indicate that it is common practice for major companies to encourage singer-songwriters to sign with both the record and the publishing branches of the major. This also applies to authors who are not singers, who can be encouraged to sign with the publishing branch of the major recording their works.
81. Universal appears to integrate its publishing and recording business more closely than other music companies. [30-40]*% of its top 500 authors are also signed with (for singer-songwriters) or recorded by Universal, whereas Universal has a market share in the record industry of only [20-30]*%. This deviation is also observed within other major music companies. More generally, the majors do not confirm this practice and at best acknowledge that exchanges of information take place between their record and publishing branches. However EMI recently stated in a press release (12 January 2007 - where the company highlights the key elements of its strategy for the next period) that it aimed at "*Extracting revenue and cost synergies between recorded music and music publishing*".
82. The market investigation indicates that when authors are encouraged to sign with a publishing sister company, it is more commonly the record company that provides this "encouragement". However, it might happen that the publisher takes the initiative.
83. Many independents claim that this practice is detrimental to their business, as they cannot compete with the majors on this ground. However, this practice is also common within the independent publishers who also control a record company.
84. Authors have a mixed view on this issue, with half considering that it is common practice and the other half not reporting it²³. Several authors stress that this practice is a means to

²³ Questionnaire to authors– phase 1. Q 17 – 45% of authors considers it is common practice to be "encouraged" to sign with sister record company versus 55% who do not report it.

increase the margin within the music company, and that it is more common with the majors than with the independents. Others state that authors, notably new singer-songwriters, might have a direct interest in signing with the publishing and the recording branch of the same company as it is a guarantee to release an album. With regard to established singer-songwriters, they have enough negotiation leverage to impose their conditions.

85. However, the merger only concerns the publishing activities of Universal and BMG. The merger will not have an effect on the recording branch of Universal. Generally, the latter will not have a greater possibility to require authors to sign with its publishing branch than before the merger. The merger will therefore not strengthen the parties' market position in the market for publishing services to authors on the basis of Universal's (unchanged) recording activities.
86. Universal might after the merger have an increased capacity to influence singer-songwriters currently signed with BMG to sign a recording deal with Universal's recording arm. However, the current market situation shows that doing so is not a condition for signing a deal. It is therefore not likely, that Universal's influence on these BMG singer-songwriters would actually translate into additional recording contracts. Considering, moreover, that only a portion of all BMG authors are singer-songwriters, this effect cannot be considered as significant and would – if at all – take place only in the long-term with the successive expiry of the existing recording contracts of those singer-songwriters. With regard to authors who are not singers and who are signed with BMG, the merger will be neutral as they are already under contract.

3. Coordinated effects

87. The market investigation has, moreover, not shown any indications which would suggest potential coordinated effects as a result of the merger. Every major publisher has a large number of authors under contract (several hundred). There was no indication that the exact terms on which a publisher signs these authors could be transparent to the competitors. Also the unpredictability of the different authors' success appears to render coordination on prices or other conditions difficult. It is, moreover, likely that competition from those larger independents which are in an intermediary position between majors and independents (e.g. Chrysalis,) would be able to counteract any coordinated strategy by Universal/BMG, EMI and Warner (and potentially Sony).

4. Conclusion

88. For all the above reasons, the Commission therefore concludes that it is not likely that the proposed concentration would lead to competition concerns due to non-coordinated or coordinated effects on the markets for publishing services to authors. The merger therefore does not impede effective competition on the market for publishing services to authors.

B. MARKETS FOR THE EXPLOITATION OF MUSIC PUBLISHING RIGHTS

89. The analysis of the affected markets for the exploitation of music publishing rights differs according to the role taken by the collecting societies in the exploitation of the specific right. As already indicated in the market definition, the collecting societies' role varies

across the different publishing rights. While print and synchronisation rights are generally managed by the publishers directly without any involvement of the collecting societies, mechanical and performance rights are normally administered via the collecting societies, without any direct licensing on part of the publishers.

90. A particular situation applies to online rights as a mixture of mechanical and performance rights. Online rights have so far been administered in the same way as the mechanical and performance rights for traditional applications, i.e. via collecting societies. However, recently, this market has been undergoing significant changes. These changes will lead to a form of rights administration which is comparable to direct licensing while, at the same time, collecting societies will remain involved, albeit in a different role from mechanical and performance rights for traditional applications.
91. This leads to differing results in the assessment of this case:
- *Synchronization and print*: As will be shown in the following analysis, the merger does not raise any competition concerns in the synchronization and print rights markets. The market investigation has shown that in the synchronization rights market sufficient alternatives will remain available for the customers of synchronization rights after the merger. As already found in the decision addressed to the parties pursuant to Article 6(1)c of the Merger Regulation, there is no significant overlap in the market for print rights as Universal has only marginal activities in this field.
 - *Mechanical and performance*: In the markets for mechanical and performance rights the merger results in a substantive overlap. Nevertheless, the merger does not lead to competition concerns due to the strong role of the collecting societies in the administration of these rights which limits the publishers' independence in pricing.
 - *Online*: The limitation in the publishers' independence in pricing, as it applies for mechanical and performance rights in traditional applications, is, however, currently being removed for the mechanical part of online rights in Anglo-American repertoire due to the on-going withdrawal initiatives. As will be shown, the significant overlap of the parties' activities leads to serious doubts, which are, however, removed by the commitments offered by the parties.
92. In this Decision, the analysis of the rights administered directly by the publishers will precede the assessment of those markets in which the collecting societies are involved. With regard to the latter assessment, the collecting societies' role will first be described in general terms in order to then differentiate between the effects of the merger according to the extent of the collecting societies' involvement in the exploitation of mechanical, performance and online rights and in particular the impact of the publishers' withdrawals from the traditional system with respect to online rights.

1. Rights administered directly: Synchronization and print

1.1 Synchronisation rights

93. In the following analysis the concept of synchronisation rights must be understood in the following sense:

- a. rights that are purchased in order to synchronize a musical work with a visual image for incorporation in an audio-visual work such as a film, TV program or TV advertisement,

and

- b. only when those rights are directly commercialised by the publishers.

94. For the purpose of this analysis, licences commercialised by the collecting societies to synchronise musical work with videos are not considered, because they are subject to similar competition conditions as those prevailing for traditional mechanical and performance rights. Notably, the blanket licences granted by collecting societies to TV channels in certain countries, for synchronisation of video and musical works, are therefore not considered in the following analysis. According to the market investigation, these synchronisation blanket licences account for less than 5% of the total synchronisation turnover of publishers.

1.1.1 Market structure

95. Following the proposed transaction, Universal would become the largest music publisher for synchronisation rights on an EEA-wide level as well as in seven Member States as the following table shows:

Market shares for synchronization rights (2005)

Synchronization	Universal	BMG	Merged	EMI	Warner	Sony	Others
	%	%	%	%	%	%	%
Austria	[10-20]*	[0-10]*	[10-20]*	[20-30]*	[10-20]*	[0-10]*	[30-40]*

EEA	[10-20]*	[10-20]*	[20-30]*	[20-30]*	[10-20]*	[0-10]*	[20-30]*

Source: Parties' estimates

96. The combined market share of Universal and BMG would exceed 30% in Italy as well as in Poland and Spain. In the latter two countries, the parties would according to their own

estimates even reach market share of slightly more than 50%. In those countries where the merged entity would take the lead, EMI or Warner would follow as second strongest competitors. In a number of countries (Austria, Belgium, Czech Republic, Greece, Netherlands), EMI would remain the leading player even after the merger.

97. The market investigation has broadly confirmed that the merged entity will obtain a strong position on the market for synchronization rights but is very unlikely to reach more than 30%. The market share estimations provided by the parties may, in some instances, even have overstated the merged entity's position, e.g. in Spain (10-20% in Spain/Portugal instead of [50-60]*% as estimated by the parties). According to estimates derived from the market investigation, EMI will remain the market leader on the market for synchronisation rights in the EEA following the merger between Universal and BMG. Universal/BMG and Warner will be on a pair.
98. The share of the independents was derived from their market share in the synchronisation market as described by the parties. According to the market investigation, synchronisation deals account for 5 to 15% of independents' turnover. However, it is hardly feasible to estimate the market share of independents in the market for synchronization rights. Therefore the parties' estimates relying on the market share of independents in the global publishing market have been considered. Nevertheless, the position of Universal/BMG cannot be considered as dominant in any market as the other majors enjoy a high share of the market. Even without any independent publisher active on this market, the position of Universal/BMG would therefore not be dominant.

EEA synchronisation market shares 2005 – source: EC Market investigation – ⁽¹⁾ Independents data have been estimated - ⁽²⁾ Denmark, Finland, Sweden, Norway

99. Following this methodology, Universal/BMG would lead the synchronisation market in France, Italy and in the Nordic countries, not far ahead of EMI. However, the merged entity would not reach market shares far ahead of the other competitors in any affected country. Countries where the parties would reach potentially critical levels of market shares would be (according to the parties' and/or the Commission's estimates) the national markets in Italy, Spain and Poland. Like in the other affected geographic markets, the merger is not likely to lead to competition concerns in those three Member States, as the following analysis demonstrates.

1.1.2 Analysis

(1) Characteristics of the synchronization rights markets

100. Synchronisation rights are purchased for the inclusion of musical works in advertising, movies or TV programs. To a much smaller extent, synchronization rights are also used in computer games and corporate presentations. They can also be purchased for digital applications such as video streaming; however this latter category is not analyzed here, but will be covered within the online/mobile rights since it mostly forms part of those rights.
101. The final customer (company requesting the advertisement, film producer, TV broadcaster) generally relies on an intermediate, such as an advertisement company, to identify musical works of potential interest for the application requested. In most cases, a pre-selection of works is proposed by the intermediate to the final customer, based on the features of the musical work and its suitability for the advertisement, film or TV show. On some rare occasions, the final customer has a specific track in mind. Therefore, in the very large majority of cases, the music is pre-selected by the agency/final customer before contacting the publisher²⁴. The final decision is usually taken either by the final customer or by the final customer together with the agency. Music companies are generally not involved, but in a few cases can make suggestions.
102. Synchronisation deals cover the following items: exclusivity, price, number of advertisement versions, territory, media concerned, and duration. Works are generally licensed to local publishers²⁵ and often concern international music²⁶. The geographical scope of the licence is national in one case out of two. The price is in general a percentage of the advertisement budget (1-5%) or film budget.
103. Synchronisation customers have the specific feature in the music industry that they do not need to have access to the complete music repertoire unlike other customers in the music industry such as record companies, radios, online music providers, etc. They negotiate each contract to have access to the rights related to one unique musical work.
104. Classical music represents a small minority of deals²⁷. Contemporary music is also in slightly greater demand than older works. Back catalogue is nevertheless an important asset in this business as chart relevant and non-chart relevant works are in equivalent demand.

²⁴ Questionnaire to synchronisation customers – phase 2. **Q 7 C** – 75% of respondents submitted that they preferably rely on an intermediate to pre-select a first set of titles.

²⁵ Questionnaire to synchronisation customers – phase 2. **Q 4** – 76% of titles are licensed from local publishers, including local subsidiaries of international publishers.

²⁶ Questionnaire to synchronisation customers – phase 2. **Q 6** – 70% of titles are extracted from international repertoires

²⁷ Questionnaire to synchronisation customers – phase 2. **Q 28** – 7% of titles are part of the classical repertoire.

105. All deals are different and are negotiated on a case by case basis²⁸. Some TV or online providers submitted that they sign blanket licences for specific TV or online applications. They are however in a different situation from usual synchronisation customers as they need the full repertoire for their daily business.

(2) Non-coordinated effects

106. The market investigation has shown that the merger will not lead to a significant impediment of effective competition as a result of non-coordinated effects in any of the affected geographic markets. Following the merger, Universal/BMG will significantly increase their market share on the market for synchronisation rights in the EEA. Universal/BMG will overall be comparable to EMI and on a par with Warner. As indicated above, only in Spain, Italy and Poland might the parties' combined market shares (according to the parties' estimates) reach critical levels. A number of practices revealed by the market investigation indicate, however, that Universal will not be in a position to impose higher prices for synchronization rights in any of the affected geographic markets.

Switching

107. Principally, synchronisation customers generally need to purchase one or a few single musical works, for example for an advertisement spot on TV or a movie. The selection of the work to purchase is done without the support of the publisher in most cases and customers usually contact the publisher via an intermediary (such as media consultants or advertising agencies). The customers therefore clearly do not select a publisher or a publisher's catalogue, but a song. The publisher is therefore in a 'waiting position' and will negotiate the terms and conditions of a synchronization licence on a case by case basis when approached by a customer.
108. Customers confirmed that they do not feel attached to any publisher, whatever its size. In particular, they confirm that the works are largely substitutable and that when the financial conditions offered for one work do not meet their expectations, they do not have problems identifying another musical work for which acceptable conditions can be agreed upon. The vast majority of customers²⁹ consider that it is even realistic to switch from one "genre" of music to another and/or from one music work to another (within the same "genre").
109. After the merger, there will therefore still be a large number of alternatives since all catalogues of the larger publishers contain several thousand different titles. A customer looking for a song for an advertisement spot will still be able to choose among thousands of songs from the other majors' and independents' catalogues even if Universal should take a leading position in terms of market shares in some countries, such as Spain, Italy and Poland.

²⁸ Questionnaire to synchronisation customers – phase 2. **Q 12**– 96% of deals are negotiated on a case-by-case basis

²⁹ Questionnaire to synchronisation customers – phase 2. **Q 27** – 83% of respondents submitted that titles are substitutable.

110. Customers report that it happens occasionally that a publisher does not grant a synchronisation licence. However the explanations varied; e.g. it was the author who refused to licence the song, or the negotiation delays were too long. Even in cases where no agreement on the granting of a licence was reached, customers could find a substitute which confirms that a sufficient number of alternatives is available to the customers.
111. The market investigation has also not confirmed that a large catalogue would be a decisive element for final customers or intermediaries in choosing a specific publisher. Customers have a mixed view on the importance of working with publishers who have a large catalogue³⁰. However, they are not interested by the size as such but rather by the possibility for a publisher to propose alternative songs when conditions cannot be agreed upon for a specific work or when suggestions are requested. However, all majors and the stronger independents, such as Chrysalis and Peer, have large catalogues with a sufficient number of works constituting credible alternatives. The larger catalogue that Universal will have after the merger will therefore not create a dominant position or allow Universal to unilaterally increase prices due to a lack of adequate possibilities for the customers to switch to other publishers in the market for synchronization rights.
112. This was confirmed by the responses of the customers in the market investigation. With regard to the merged catalogue of Universal and BMG, synchronisation customers consider that Universal/BMG would not be in a stronger position than its main competitors³¹.
113. Since synchronization right customers do not need access to a complete catalogue but pick only a few titles, the enhanced size of Universal's catalogue does not give rise to competition concerns because a sufficient number of alternative publishers with a vast number of songs remains available. Synchronisation customers have the possibility to find alternative titles easily across genres.

Volatility of market shares

114. The parties, moreover, submit that the business of synchronization rights is very volatile. The market shares exhibit significant changes from year to year. According to the parties' estimates, the market share for Spain only increased to [50-60]*% in 2005, after having ranged between [20-30]*% in the two preceding years. A similar situation applies to Poland, where the parties' combined market share was [20-30]*% in 2003, [20-30]*% in 2004 and [50-60]*% only in 2005.
115. This volatility results from the revenues achieved with synchronization rights sold for a single film or advertisement spot which are mostly limited to the time period in which the advertisement spot is published or the film is shown. The terms of the contracts for advertisements are, according to the parties' information, mostly 1 year or less (3 – 6 months). Depending on the deals closed in a specific year, the market shares may therefore change significantly.

³⁰ Questionnaire to synchronisation customers – phase 2. **Q 31** – 55% of respondents consider that it is important for a publisher to have a large catalogue, vs 45% who do not consider it to be a key success factor.

³¹ Questionnaire to synchronisation customers – phase 2. **Q 32**– 65% of respondents submitted that Universal/BMG would not be in a stronger position than its competitors thanks to the merger.

116. This also becomes apparent when looking at the total revenues achieved in those countries with the highest estimated market shares (parties' estimates) Italy, Spain and Poland. Only in Italy did the revenues achieved by Universal and BMG exceed EUR 1 million each in 2005 (Universal EUR [...]*; BMG EUR [...]*). In Spain and Poland, the revenue of each of them was below EUR 1 million (Poland: Universal EUR [...]*; BMG EUR [...]*; Spain: Universal EUR [...]*; BMG EUR [...]*). Considering that the revenue for one deal may amount to EUR 0.5 million ([...]*), the potentially leading market position of the merged entity cannot be regarded as stable. It is plausible that, with a few larger deals, the distribution of market shares among the large publishers may change considerably, which reflects that Universal's market position will remain contestable.

No impact of vertical integration

117. The market investigation has also not confirmed that Universal could achieve a leading market position after the merger on the basis of its vertical integration into the recording business.
118. When including music in a video, a synchronisation customer needs to obtain two licences, one from the publisher and the other from the record company. Therefore the unique position of Universal (post-merger) of controlling the largest publisher catalogue and being the largest record company might be theoretically leveraged to impose market conditions in its favour, notably for titles for which Universal/BMG would control both recording and publishing rights.
119. However the market investigation highlights that even if synchronisation customers would appreciate working with a single company to simplify the acquisition of rights, this is not a key element of their decision. They would notably not accept to pay higher fees when working with a company able to grant both record and publishing rights for the work they are interested in³². Customers consider that there is enough choice proposed by other companies to switch.
120. In addition, while the publishing rights are necessary to include a musical work in an audio-visual work, the record rights can be by-passed by recording a new version. This is done in many cases by advertising companies in order to adapt the music to the advertisement and to lower the costs when the record company's demands exceed what the customers are ready to pay. As the music comes in support to an audio-visual work, the artist is not the key element of the final product.
121. Moreover, Universal/BMG would only control both recording rights and complete publishing rights over a minority of the titles in which it has an interest. For instance, in Germany, Universal/BMG completely controls [10-20]*% of the titles in which it has both recording and publishing rights³³. In France, this control is as low as [0-10]* %, and

³² Questionnaire to synchronisation customers – phase 2. **Q 20**– 86% of respondents submitted that they would not accept to pay higher fees to a company for the reason that this company is able to propose a single package of recording and publishing rights.

³³ Based on the 2006 official top 100 charts in affected countries. Numerator: top 100 titles for which Universal/BMG controls both recording rights and 100% publishing rights. Denominator: top 100 titles for which Universal/BG controls either recording rights or a share of publishing rights. Austria – [10-20]*%; Belgium – [0-10]*%; Czech Republic – [10-20]*%; Finland – [0-10]*%; France – [0-10]*%; Germany – [10-

in the United Kingdom as low as [0-10]*%. This implies that focusing specifically on titles for which it has full control, would force Universal/BMG to decrease the commercial exploitation of the very large majority of works in its catalogue (both in recording and publishing).

122. Synchronisation customers are able to find a substitute relatively easily and have the possibility to record a new version of the musical work. Therefore a strong position in the record industry is an asset, but is unlikely to allow for changing the balance of negotiation. It is therefore unlikely that Universal/BMG could leverage any market power stemming from the vertical integration between publishing and recording activities in the market for synchronisation rights.

Conclusion on non-coordinated effects

123. It is very unlikely that the merged entity will achieve a critical market position. Even on the basis of the most critical market share estimates, it is not likely that competition concerns could arise since the merged entity's market position will remain contestable as a result of the fact that a sufficient number of alternatives will remain. Customers can easily switch between songs and publishers. The merger will therefore not lead to a significant impediment of effective competition on the basis of unilateral effects in the market for synchronization rights.

(3) Coordinated effects

124. It is also unlikely that the merger could lead to competition concerns on the basis of coordinated effects on the market for synchronization rights.
125. The market for synchronisation rights is such that two deals are rarely comparable in terms of price, duration, territory, media, and renown of work. For instance, two advertisements generally cover different products, address different target customers and therefore rely on different musical works. Musical works can be acquired for different periods and licences might cover different geographical areas. Therefore synchronization contracts are highly heterogeneous, and do not favor a coordinated approach of the majors.
126. In addition, according to the *Airtours*³⁴ and *Impala*³⁵ judgments, one of the conditions to be met to characterize a collective dominance on a market is sufficient market transparency, so that each member of the dominant oligopoly has the ability to know how the other members are behaving in order to monitor whether or not they are adopting the

20]*%; Greece – [0-10]*%; Hungary – [0-10]*2%; Italy – [10-20]*%; Netherlands – [0-10]*%; Norway – [0-10]*%; Poland – [10-20]*%; Spain – [10-20]*%; Sweden – [0-10]*%; United Kingdom – [0-10]*%.

³⁴ T-342/99 (*Airtours/Commission*), [2002] ECR II-2585.

³⁵ T-464/04 (*Impala/Commission*).

common policy. It can be inferred from the market investigation that such a transparency is not achievable in the synchronization market considering the large spectrum of deals³⁶.

127. Some synchronisation deals include a "Most Favoured Nation Clause"³⁷ with regard to the most preferential conditions and terms of the contracts. However this cannot be regarded as an indication for a degree of overall transparency which would allow to tacitly coordinating. This clause is notably applied in synchronisation deals to ensure that record and publishing company controlling a title obtain an equivalent share of the deal (which is difficult to obtain when the work (publishing) and the performer (recording) do not have the same notoriety).
128. In addition, the market investigation confirmed that customers do not consider that there is transparency on prices³⁸.
129. Synchronisation customers consider that the concentration will not facilitate the coordination between majors³⁹. It can be concluded that conditions for coordination in the market for synchronisation rights are unlikely to be met.

1.1.3 Conclusion

130. For all the above reasons, it is therefore concluded that it is not likely that the proposed concentration would create competition concerns. The merger, therefore, does not lead to a significant impediment of effective competition on the markets for synchronization rights.

1.2 Print rights

131. Print rights are regularly licensed directly by the publishers without any involvement of collecting societies. The print rights market is rather small in size (EEA-market volume EUR [...] million in 2005 according to the parties' estimates) with specialized publishers. Universal is mostly not active in this market. The merger will, therefore only lead to a marginal overlap in the Netherlands and at EEA-wide level as the following table shows:

³⁶ Several publishing companies provided examples of synchronisation deals varying from EUR 1 000 to several hundreds thousand euros, covering different geographical areas, different time periods, etc.

³⁷ The MFN clause stipulates that when purchasing synchronisation rights for several works from different publishers, if one publisher benefit from more advantageous conditions, these conditions will apply to all publishers involved in the deal. The MFN also applies when only one title has to be purchased by a customer, and ensures that the record company and the publisher who commonly control this title will receive an equal share of the deal. Questionnaire to synchronisation customers – phase 2. **Q 14**– 84% of synchronisation customers reported the existence of MFN clause in their contracts.

³⁸ Questionnaire to synchronisation customers – phase 2. **Q 33** – 79% of respondents did not believe that the prices they negotiate are known by competitors.

³⁹ Questionnaire to synchronisation customers – phase 2. **Q 42**– 65% of respondents consider that the merger will not facilitate coordination between the majors.

Print	Universal	BMG	Merged	EMI	Warner	Sony	Others
	%	%	%	%	%	%	%
Hungary	[0-10]*	[70-80]*	[70-80]*	[0-10]*	[0-10]*	[0-10]*	[20-30]*
Italy	[0-10]*	[30-40]*	[30-40]*	[10-20]*	[10-20]*	[0-10]*	[30-40]*
Netherlands	[0-10]*	[20-30]*	[20-30]*	[10-20]*	[0-10]*	[0-10]*	[40-50]*
EEA	[0-10]*	[0-10]*	[0-10]*	[0-10]*	[0-10]*	[0-10]*	[70-80]*

132. The market shares in Hungary and Italy also exceed 15%. However, there is no overlap.
133. It is therefore unlikely that the merger could lead to competition concerns in any of the affected national markets or at EEA-wide level.

2. Rights traditionally administered via collecting societies: Mechanical, performance and online

2.1 Background: Collecting societies

2.1.1 The current system of collecting societies

134. Collecting societies are organizations which were established to act on behalf of right owners in order to relieve the administrative burden of licensing publishing rights, monitoring the use of music and collecting royalty income. Collecting societies generally control the licensing of both mechanical and performance rights, including online rights which are composed of the previous two.⁴⁰ They may require an assignment of rights from the right-holders, or an exclusive licence to grant licences to users of music.
135. Authors usually become members of the collecting society in their country of residence. They thereby entitle their collecting society to administer their mechanical and performance rights, including online rights⁴¹. It is then the collecting societies' task to grant licences and collect the royalties from the users. For this, the collecting society retains a percentage of the royalties collected as commission fee. The net royalties collected are shared between the authors and their publishers.
136. The publishers' receive a part of the royalties as compensation for the advances they had paid to the author and the publishing services they provide to the author. In their classical role, the publishers' main service would consist in helping the author to establish a contact with a record company with a view to the author's song being chosen by the record company for one of their performing artists and subsequently recorded. For this, the recording companies need to have licences for the relevant publishing rights. They

⁴⁰ Certain exceptions apply. For example, the performing right societies do not always administer the so-called "grand rights" (performances of dramatico-musical works and ballets). In the United Kingdom, Germany and Scandinavia, for example, these performances are licensed directly. On the other hand, in France, Italy, Greece, Spain and the Netherlands "grand rights" are licensed through societies

⁴¹ Normally, synchronization rights (rights to combine music with pictures, e.g. in movies and advertisements) and print rights (rights to print sheet music) are not licensed via the collecting societies but directly by the publishers.

acquire these as blanket licences from the collecting societies who subsequently collect from them a share of the revenues made by selling the CDs containing the respective song.

137. In the case of online music providers a similar situation exists: In order to be able to offer the song on a downloading platform they have to acquire a licence over the author's publishing right from the collecting society. However, in addition, they also have to acquire a licence from the recording company for the recording rights which protect the individual interpretation of a song and which are originally partly in the hands of the recording company and partly in the performing artist's hands. The performing artist normally transfers them to the record company. As a consequence, a share of the online music provider's revenue made by selling the song as a downloading track will subsequently go as a license fee to the performing artist/record company and another share to the author and his publisher via the collecting societies.
138. In order to grant licenses and collect royalties also from users abroad, the collecting societies co-operate worldwide on the basis of so-called "reciprocal representation agreements". These representation agreements give each one of them the right to license not only the repertoire of their own members but also the repertoire of all associated collecting societies (this complete repertoire will hereinafter be referred to as "world repertoire" even though there might be exceptionally collecting societies which do not participate in this system). However, on the basis of these agreements, these licences are, currently only granted for the use of music within the country where the collecting society in question is located. Each collecting society in principle has the right to license the repertoire of its own members EEA- or even worldwide. On the basis of the reciprocal agreements, however, each collecting society limits the scope of its licences for the complete repertoire administered, including both the works of the own members as well as the other collecting societies' works, to its own country. At the same time each collecting society collects royalties from users in its own country not only for its own members but also for the authors and publishers abroad who are members of the associated collecting societies.
139. Collecting societies are normally considered dominant in their respective countries. They are for this reason bound by non-discrimination obligations and are not allowed to refuse licences. As a consequence, they usually charge a uniform price for the whole repertoire (only differing per category of use).

2.1.2 Commission's Recommendation concerning online rights

140. So far, mechanical, performance and online rights have been all managed in the traditional system of collecting societies. The pricing decisions in this system are made by the collecting societies. However, due to their dominant positions, the collecting societies are regularly obliged to charge non-discriminatory tariffs and are not allowed to refuse licences to customers. Consequently, they are not usually allowed to charge different tariffs to the right-users –differences in tariffs only apply with respect to different forms of exploitation. The music of all member authors and publishers is normally covered by a blanket licence which defines a uniform price for all titles and users of one right category. Publishers can normally only indirectly influence the tariffs for those licences via their representation on the boards of the collecting societies which, however, usually restrict the number of seats available to publishers.

141. In this traditional system, international music users need to get licences over the worldwide repertoire from the respective collecting societies in each of the countries in which they want to operate. The disadvantages of geographically limited licences were considered as particularly harmful for the development of the online music business. To address this problem in the online music business, the Commission has affirmed that right-holders should be able to withdraw their rights from the traditional collecting societies system in order to transfer them to one or more selected collecting societies for their EEA-wide administration. Right-holders may be publishers and authors who control the relevant rights to differing extents due to the specific features of rights management in the Anglo-American repertoire and the Continental European repertoire.
142. The lack of EEA-wide licences for online applications has already been under discussion for some time. The collecting societies themselves have attempted to create a system which allows for multi-territorial licensing. The so-called "Santiago agreement" (signed at a CISAC⁴² Congress in Santiago de Chile) was concluded between a number of collecting societies in 2001 and allowed for global performance right licences for internet broadcasting. However, the agreements contained a customer allocation provision which restricted the broadcasters to acquiring a multi-territorial licence only from the collecting society in the country in which they operated and resided economically (economic residency clause). In 2004, the Commission issued a statement of objections against the Santiago agreement and in particular the economic residency clause. The Santiago Agreement expired at the end of December 2004 and was subsequently not renewed.
143. In parallel to the Santiago agreement dealing with performance rights, the association of collecting societies in charge of mechanical rights, the "Bureau International des Sociétés Gérant des Droits d'Enregistrement et de Reproduction Mécanique" ("BIEM"), adopted a similar standard contract at its general meeting in Barcelona – the "Barcelona agreement" - for the corresponding mechanical rights, in 2001. Following the discussions on the Santiago Agreement, also the Barcelona Agreement was not renewed after its expiry at the end of December 2004.
144. In 2005, the Commission issued its Recommendation with respect to online rights: the Commission Recommendation on collective cross-border management of copyright and related rights for legitimate online music services (the "Recommendation") which addressed the issue of EEA-wide licensing in the online sector. The Recommendation was based on a preceding Commission Staff Working Paper ("the Working Paper") concerning Cross-Border Collective Management of Copyright⁴³ in which the Commission identified several problems with respect to the licensing of online rights.
145. The Working Paper examined the existing structures for cross-border collective management of copyright for the provision of online music services and concluded that the absence of EU-wide copyright licences for online content services makes it difficult for these music services to develop. In order to improve cross-border management of copyright, the Working Paper considered three options: (1) do nothing (Option 1); (2) improve the current system by eliminating territorial restrictions and discriminatory

⁴² Confédération Internationale des Sociétés d'Auteurs et Compositeurs

⁴³ Commission Staff Working Document - Study on a Community Initiative on the cross-border collective management of copyright, 7 July 2005.

provisions in the reciprocal representation agreements concluded between collecting societies (Option 2); or (3) give right-holders the choice to authorise a collecting society of their choice to manage their works across the entire EU (Option 3).

146. The Working Paper concluded that Option 3 would offer the most effective model for cross-border management. With respect to cross-border licensing, allowing right-holders to choose a collecting society outside their national territories for the EU-wide licensing of their works, would create a competitive environment for cross-border management of copyright. The Working Paper found that the right-holders' freedom to choose any collecting society in the EU would be an incentive for these societies to provide optimal services to all their right-holders, irrespective of their location.
147. While Option 3 explicitly referred to competition between collecting societies for right-holders (authors and publishers), Option 2 would – by removing the territorial restrictions in the reciprocal agreements – introduce the possibility for each collecting society to grant multi-territorial licences over the complete world repertoire and thereby focus on competition between collecting societies for right-users, who could choose their access point to this world repertoire. The Working Paper favoured Option 3 since it would not only introduce competition between collecting societies for right-holders, but at the same time would allow collecting societies to build up their own attractive repertoires for users. In the Working Paper it was expected that different prices would develop for these different repertoires.
148. The subsequent Recommendation consequently stated in paragraph 3 that "Right-holders should have the right to entrust the management of any of the online rights necessary to operate legitimate online music services, on a territorial scope of their choice, to a collective rights manager of their choice, irrespective of the Member State of residence or the nationality of either the collective rights manager or the right-holder" which reflects the withdrawal possibility indicated in option 3.⁴⁴ While the exact forms of withdrawal and subsequent licensing in a market following option 3 are still developing, some features are apparent: In a restructured market after a withdrawal of rights by authors and publishers from the traditional collecting societies system, an international music user would receive EEA-wide licences from the collecting society or societies in charge. These licences would no longer cover the world repertoire, but only the repertoire which is represented by the specific collecting society and its member right-holders who selected this collecting society for the EEA-wide administration of their rights.

⁴⁴ It is worth noting, that the possibility for right holders to withdraw and transfer their rights to one collecting society has been established notably by the "GEMA" Decision (case IV/26760 of 2 June 1971, OJ L 134/15 of 20 June 1971). This principle has been reaffirmed by the Recommendation. Apart from this, the Commission has recently taken a preliminary position against territorial restrictions and restrictions of membership in the CISAC-case (COMP/C2/38.698) in which a Statement of Objections has been issued. With respect to public performance rights, collecting societies have concluded reciprocal representation agreements based on a non-mandatory model of CISAC (The International Confederation of Societies of Authors and Composers). The Commission considers that certain aspects of the agreements might infringe Article 81 of the EC Treaty with respect to the membership restrictions which oblige authors to transfer their rights only to their own national collecting society and the territorial restrictions, which oblige commercial users to obtain a licence only from the domestic collecting society and limited to the domestic territory. The territorial restrictions raise competition concerns in particular in view of certain new forms of distribution, such as internet licensing, satellite transmission and cable retransmission.

149. In the framework of this merger assessment, no position is taken on the withdrawal of rights as such. The withdrawal initiatives already undertaken or likely to be started in the near future show the development of the market which needs to be taken into account in the merger analysis since it defines the competitive conditions under which the merger will show its effects. The following assessment therefore analyses the effects of the merger in a restructured market and compares the situation on the restructured market without the merger with the situation with the merger.

2.1.3 Withdrawal of rights from the current collecting societies system

150. Since the Recommendation was issued, several publishers have started to withdraw rights from the traditional system of collecting societies in order to give the rights to one or more selected collecting societies. All initiatives relate to online applications and mostly focus on Anglo-American mechanical rights as part of the affected online rights. The main reasons why publishers focus on mechanical rights for Anglo-American repertoire result from the differences in the administration of rights.

(1) Administration of rights

151. The administration of rights via collecting societies differs with respect to Anglo-American titles on the one hand, i.e. titles which are registered with collecting societies in the United Kingdom, Ireland and in the US⁴⁵, and Continental European titles on the other, even though both are part of the system of reciprocal agreements as described above. While the differences between Anglo-American and Continental European rights administration are not large with respect to *performance* rights they are substantial in the administration of *mechanical* rights.

152. One underlying reason for the differences is the historically different legal concept concerning the protection of works. In the US and in the United Kingdom, the "copyright" relates to a publisher's investment into a work. The publisher is entitled to full protection of his investment by the copyright law. In contrast, according to the originally French concept a creator of a work owns his creation and is protected by the "droit d'auteur". This concept which allocates the original control over a work to the creator spread from France throughout Continental Europe.

153. The administration of publishing rights mainly differs with respect to:

- ownership of rights and
- international contractual relations and transfer of royalties ("international administration").

154. Both aspects are intertwined and have an influence on the power of the publishers and their possibility to withdraw rights from the traditional collecting societies' system which is one pillar of the competition assessment in this case.

a. Continental European repertoire

⁴⁵ Other countries might have a similar system, such as Canada, Australia, New Zealand or South Africa. Accordingly, sometimes the term English-language repertoire is used instead of Anglo-American repertoire. Since the music from authors in the United Kingdom and in the US covers the large majority of non-classical titles, the following description will only refer to the United Kingdom and to the US.

155. *Ownership of rights:* In Continental Europe, most authors transfer their mechanical and performance rights directly to the collecting societies. They therefore do not normally transfer the rights over the works to the publishers, but rather give them a right to obtain a part of the royalties instead. The ultimate control of the mechanical and performance rights over the authors' works therefore usually remains therefore with the authors (or subsequently with their collecting societies if assigned to them) and is not transferred to the publishers. Any change as to the administration of rights would, in this system, normally need the approval of the author.
156. *International administration:* The collecting societies are entitled by the authors to do the administration as well as the international transfer of royalties within the collecting societies' system. On the basis of the reciprocal agreements, an author's collecting society will grant licences and collect royalties only on a national basis. The administration of these rights in other countries is done by the associated collecting societies in their respective countries. All associated collecting societies grant licences on a territorial basis and collect the royalties from the users in their territory.
157. The international transfer of these collected royalties from the countries of the users to the country of the author is done differently for the part of the royalties to be paid to the author and the part payable to the publisher. Generally, all collecting societies define a split of royalties between authors and publishers. This split is determined pursuant to the terms of the collecting societies' rules and reflected in their mandates with authors and publishers. The ultimate division of royalties between the author and the publisher may differ from this pre-defined split, if the publisher pays an extra portion of the royalties received to the author, in addition to the royalties paid directly by the collecting society. The split prescribed by the collecting societies guarantees a certain remuneration for the author and was established to protect the authors.⁴⁶ The shares for the two sides are called the "author's share" and "the publisher's share" respectively.
158. For the author's share, the distribution of royalties is done via the collecting societies. The collecting societies collect all the royalties for the author's work in their countries. They then transfer the author's share to the original collecting society which in turn passes it on to the member author. The publisher's share, however, will not be transferred to the original collecting society but to a local subsidiary or agent (both called "sub-publisher") of the original publisher in the respective countries.⁴⁷ These sub-publishers transfer the publisher's share of royalties to the original publisher.⁴⁸

⁴⁶ These splits vary between collecting societies as well as between the right categories. In Germany, for example, 40% of the collected net royalties for mechanical rights (after deduction of the collecting society's commission fee) will be retained by the publisher while the author retains 60%. For performance rights the publisher will usually retain 33.33% with the author receiving the rest of 66.66%. Also in the other Continental European countries such splits are applied (often 50% - 50% or 25% - 75%) which all have in common that none of the two sides involved – author and publisher – gets 100%.

⁴⁷ The parties indicate that the major music publishers are established in many Member States and as a result, their need to conclude sub-publishing deals in the EU is more limited than for many of the independents. Also the majors, however, use third-party sub-publishers in other parts of the world. Universal also has sub-publishing agreements in [...]*

⁴⁸ Since – as described above - the control over the mechanical and performance rights in Continental Europe is normally not with the publishers, the international distribution of the publisher's share generally does not take place on the basis that the sub-publisher owns the right over a work itself but only a right to the publisher's share of income.

b. Anglo-American repertoire

159. For Anglo-American repertoire different rules apply in respect of mechanical rights and in respect of performance rights.

Mechanical rights

160. *Ownership of rights:* Authors in the United Kingdom normally transfer their mechanical rights to 100% to their publishers who, in the traditional system, subsequently appoint the United Kingdom collecting society MCPS for the administration of these rights. The control over Anglo-mechanical rights is therefore normally fully transferred to the publishers who do not need the authors' approvals for decisions over the administration of these rights.
161. *International administration:* MCPS could, in principle, sell worldwide licences for the rights it administers. However, the publishers also grant territorial mechanical rights to the own sub-publishers abroad in parallel. These sub-publishers are members of their local collecting societies. They subsequently appoint their respective collecting society for the administration of the mechanical rights limited to their territory. As a consequence, the territorial scope of MCPS is restricted accordingly since its licences can only cover those countries in which no sub-publisher has the relevant mechanical rights.⁴⁹
162. Consequently, all royalties from Anglo-mechanical rights are collected internationally by the respective collecting societies in their countries. Since no split into publisher's share and author's share applies here, the complete royalties (after deduction of the collecting societies' commission fees) are transferred to the relevant local sub-publishers who pass it on to the original publisher in the United Kingdom. The original publisher will then pay out the agreed share of the royalties to the author.
163. For mechanical rights in the US a similar system applies with the difference that publishers collect mechanical royalties in the US directly from the users without any involvement from the US collecting societies. As in the United Kingdom, the US-publishers grant territorial rights to their sub-publishers in the different EEA-countries who appoint the national collecting societies for the administration of the rights. In Europe, therefore, effectively the same system applies for US-works as for United Kingdom-works with respect to mechanical rights.

Performance rights

164. For Anglo-performance rights the administration is in essence the same as for Continental European mechanical and performance rights. The United Kingdom-authors normally transfer their performance rights directly to the relevant collecting society in the United Kingdom: PRS. Control over these rights is therefore not transferred to the publishers.

⁴⁹ See MCPS-PRS' reply to Questionnaire to Collecting Societies 1, dated 7 November 2006, question 28: "The MCPS Membership Agreement is one of agency and it is concluded on the same terms regardless of whether the principal is a music publisher or writer. The member (whether writer or publisher) appoints MCPS to act as the member's sole and exclusive agent (clause 1). The appointment is not only for the United Kingdom: please see the definition of "Territory" contained in clause 6 of the Membership Agreement. Under this clause members retain the right subpublish, and be members of organisations similar to MCPS in other countries of the world; such sub-publishing and local collecting society membership overrides the Membership Agreement."

The publisher's share and the author's share are each 50%. Their international administration is managed as described above for Continental European rights.

165. For US-performance rights some specific features apply. American performance rights are typically not assigned to either a collecting society or a publisher but to both. The relevant US collecting societies are ASCAP and BMI. According to the parties, approximately 49% of the US authors are members of ASCAP and 49% are members of BMI.⁵⁰ The US authors licence their rights to the US performance collecting societies BMI or ASCAP and at the same time to a publisher. ASCAP and BMI have reciprocal agreements with the European collecting societies pursuant to which they grant them the right to licence the US performance rights for exploitation in their respective countries. The collecting societies pay the collected revenues to the sub-publishers who are members of the national collecting societies.⁵¹
166. US collecting societies also apply a split of royalties between authors and publishers in the same way as the European collecting societies do for performance rights. Both BMI and ASCAP, collect 100% of performing rights income and pay 50% to the author and 50% to the publisher. The parties confirm that the international flow of royalties is the same for US-performance rights as for Anglo-performance rights: the publisher's share goes via the sub-publishers and the author's share goes via collecting societies.

(2) Resulting withdrawal possibilities for publishers

a. Withdrawal possibility for Anglo-American mechanical rights

167. The main difference between Continental European repertoire and Anglo-American repertoire relates therefore (i) to the fact that, in the Anglo-American world, the authors' mechanical rights are completely transferred to the publishers who therefore have full control over those rights and (ii) to the sub-publishing system which fully applies to Anglo-American mechanical rights and preserves full control for the publishers over the international management of their rights. This system is to a large extent dependent on their agreements with sub-publishers as opposed to agreements with or between collecting societies.
168. While the parties disputed the possibility and scope of a withdrawal of rights by publishers, the market investigation has brought clear results as to Anglo-American mechanical rights. As described above, the Anglo-American authors assign 100% of their mechanical rights to their publishers. The publishers therefore have full control over these rights and may decide to withdraw from the traditional collecting societies system without the need for approval by the authors.

⁵⁰ The remaining 2% or less are members of the third US-collecting society SESAC.

⁵¹ While ASCAP members may grant their full rights in parallel to the publishers who assign those rights to the sub-publishers, BMI members assign their rights to the publishers only for those territories in which BMI has no reciprocal agreement with the national collecting society. The sub-publishers in the countries where BMI has a reciprocal agreement therefore do not own the rights (since the original publisher does not have them for this territory and therefore cannot assign them to the sub-publishers), but they may collect according to the BMI agreement the revenues out of the licensing which are made by the European collecting societies. Ultimately, therefore no major difference occurs between ASCAP and BMI with respect to the flow of royalties.

169. In practical terms, the withdrawal of Anglo-mechanical rights basically requires that the publishers in the United Kingdom terminate the sub-publishing agreements on mechanical rights with their sub-publishers in other countries in order to effectively withdraw these mechanical rights from the collecting societies in the different countries.⁵² With such a termination of sub-publishing contracts, the sub-publishers no longer have the right to represent the original publisher's repertoire in their respective territory for which they had been entitled to sub-publish. This "automatically" withdraws those rights from the local collecting societies since they only may grant licences and collect royalties for the repertoire which these sub-publishers represent. Some collecting societies accordingly indicated that the termination of sub-publishing agreements does not exactly qualify as a "withdrawal" since it does not require the (partial) termination of a membership agreement with the collecting society. The withdrawal effect is, however, the same as with a termination of a membership agreement. The collecting society which previously granted licences for the sub-publisher's repertoire is no longer entitled to do so for those rights which are no longer represented by the sub-publisher.
170. With such a termination of sub-publishing contracts, the original publisher in the United Kingdom gathers the rights for the Anglo-repertoire in all territories in which the sub-publishers previously were in charge. The geographical scope of the licences that MCPS can subsequently grant is – if no sub-publishing agreement is maintained – worldwide. A publisher wishing also to withdraw the rights from MCPS needs to consider the conditions under which such a withdrawal is viable according to the statutes and the membership agreement. MCPS indicates that following entry into the membership agreement a member can exclude MCPS' powers with respect to a number of right categories including online rights by giving MCPS three months notice.⁵³ With respect to American mechanical rights the publishers similarly only need to terminate sub-publishing contracts.
171. Anglo-American titles represent the majority of the non-classical popular music. Looking at the official charts in the affected countries, on average 74% of the titles are Anglo-American repertoire. The exact shares differ per country since the importance of local repertoire varies. The shares range from approximately 50% in Spain and France to virtually 100% in the United Kingdom.

b. Withdrawal possibility for Continental European repertoire

172. Rights in Continental European repertoire (as well as Anglo-American performance rights) are more difficult to withdraw from a publishers' perspective. Unlike for Anglo-American mechanical rights, here the rights are not assigned to the sub-publishers in the different territories, but are administered internationally via the network of collecting societies (only the publishers' share of royalties is transferred via the sub-publishers). A withdrawal would therefore require the (partial) termination of a membership agreement with the original collecting society to which the rights were assigned. As a consequence

⁵² It was largely confirmed by the collecting societies that a withdrawal of Anglo-American mechanical rights is easy for the publishers on the basis of the termination of sub-publishing agreements. See the responses to the Questionnaire to collecting societies 3, dated 5 February, question 8; 12 collecting societies answered to this question: 10 clearly confirmed, 2 confirmed in principle but also indicated that the actual legal effects depend on the specific agreements.

⁵³ See MCPS/PRS' answer to the Questionnaire to collecting societies 1, dated 7 November 2006, question 26.

of such a termination, neither the original collecting society nor the associated collecting societies abroad could continue to exploit these rights.

173. However, in general, it seems that it would be the authors, rather than the publishers, who could withdraw rights from the collecting societies. The parties submit that legally the publishers may not withdraw any rights, since in the Continental European system, the authors normally assign their rights to the collecting societies, whereas the publishers only receive a right to a share of the royalties, but not a right over the work itself. This would effectively prevent publishers from deciding on a withdrawal. According to the parties' submission, in Continental Europe, publishers therefore have no control over the mechanical and performance rights and would need the authors' approvals for a withdrawal. This would equally apply to Anglo-American performance rights.⁵⁴
174. The market investigation has shown, that the precise national conditions differ in this respect mainly due to often complex and intertwined provisions of the relevant national laws, the statutes and membership agreements of the collecting societies as well as the publishers' agreements with the authors. A number of collecting societies also indicate that the precise possibility of a withdrawal initiated by the publishers in the individual countries also depends on the contracts between the authors and the publishers⁵⁵ which might not be fully known to the collecting society.
175. The market investigation has largely confirmed that a withdrawal of Continental European repertoire (as well as Anglo-American performance rights) is substantially more difficult than is the case for Anglo-American mechanical rights. It is very likely that Universal could generally not withdraw the respective Continental European mechanical and performance rights without the authors' approvals. In Germany, for example, authors are regularly members of GEMA and assign their rights to GEMA under their membership agreement. They may only assign their rights to publishers to the extent that they have not been previously assigned to GEMA. This, however, generally only relates to synchronisation rights and print rights. GEMA confirms that the authors usually assign 100% of their rights to GEMA and that control over these rights is therefore with the authors.⁵⁶ The same applies to France: SACEM confirms that the authors regularly transfer 100% of their rights to SACEM, which even leads to the result that SACEM itself

⁵⁴ A specific situation applies to American performance rights. As explained above, US authors licence their rights to the US performance collecting societies BMI or ASCAP and at the same time to a publisher. ASCAP and BMI have reciprocal agreements with the European collecting societies pursuant to which they grant the right to licence the US performance rights for exploitation in their respective countries. While ASCAP members may grant their full rights in parallel to the publishers who assign those rights to the sub-publishers, BMI members assign their rights to the publishers only for those territories in which BMI has no reciprocal agreement with the national collecting society. Consequently, publishers can according to the parties bundle their ASCAP performance rights for EEA-wide administration, but the European collecting societies will nevertheless still be able to grant territorial licences for the ASCAP-repertoire which was assigned to them by the authors on a non-exclusive basis. For BMI, no withdrawal by the publishers appears to be possible where the authors have assigned the rights to BMI and in those territories where BMI has no agreement with any other collecting society.

⁵⁵ This is well reflected by AEPI in its response to the Questionnaire to collecting societies 2, Table 3: "For all rights the approval of the author depends on the agreement that he has entered into with the publisher. The publisher administers whatever the creator has assigned to him."

⁵⁶ See GEMA's reply to the Questionnaire to Collecting Societies 3, dated 5 February 2007, question 9c.

has control over the rights.⁵⁷ A withdrawal by a publisher would consequently not be possible.

176. In some other countries, there is significant legal uncertainty as to the publishers' possibilities to withdraw. According to the parties, Austrian authors, for example, assign their rights on an exclusive basis to both the collecting societies AKM (performance collecting society) and Austro Mechana (mechanical collecting society) as well as to the publishers. This would, according to the parties, create legal difficulties in the event that a publisher planned to withdraw. In fact, it would first have to be clarified which exclusive licence was valid. The answers of the two different collecting societies did not provide a clear picture: AKM confirmed that any withdrawal would generally need the author's approval, whereas Austro Mechana stated that it did not have any data on this question⁵⁸.
177. Similarly, for some of the affected countries the complex legal situation often made it impossible to obtain clear answers. This in itself shows the significant degree of legal uncertainty connected to a withdrawal of rights relating to Continental European repertoire. Overall, the market investigation confirmed that the authors as well as the collecting societies have substantially more control over their rights in Continental Europe than in Anglo-American countries and that any withdrawal of Continental European repertoire will – due to the likely legal difficulties - need more time than a withdrawal of Anglo-American mechanical rights. The withdrawal of rights by the publishers without prior approval by the authors is therefore only likely in respect of mechanical rights for Anglo-American repertoire. This is also confirmed by the fact that the current withdrawal initiatives focus on Anglo-American mechanical rights for online applications as described in more detail below. While it cannot be excluded that in the long-term also a withdrawal of Continental European repertoire will be intended by the publishers where legal possibilities for this can be found in the national legal frameworks, it cannot be assumed to be a likely step which could be expected in the foreseeable timeframe.

(3) Current withdrawal initiatives

178. All currently known withdrawal initiatives cover mainly mechanical rights for online use. They do not apply to mechanical or performance rights in their traditional, off-line applications. The withdrawal initiatives moreover generally only cover Anglo-American repertoire.
179. Several publishers are currently re-organising their Anglo-American mechanical rights for online applications according to different models. This trend follows the Recommendation which re-affirms that right holders have the right to authorize a single collecting society to licence and monitor their rights across Europe.
180. Just before the proposed transaction, Universal studied different scenarios [...] which ranged from granting one collecting society with all copyrights to select several collecting societies at the same time in order to withdraw the current collective management of copyrights. These attempts by Universal were formally made known to the Collecting Societies: Universal had initially informed them that it would withdraw its online rights

⁵⁷ See SACEM's reply to the Questionnaire to Collecting Societies 3, dated 5 February 2007, question 9c.

⁵⁸ See AKM's and Austro Mechana's replies to the Questionnaire to Collecting Societies 3, dated 5 February 2007, question 9d.

[...]*, but afterwards informed them that this process was put on hold. The most advanced projects of Universal involved [...]* dealing with the Anglo-American repertoire. The parties also indicated intentions to explore a co-operation with [...]*. This would, however, require subsequent agreements with other collecting societies due to the difficulties connected with a withdrawal of Continental-European rights by publishers as can be seen from the internal documents provided by Universal [...]*⁵⁹.

181. BMG also studied some withdrawal possibilities in 2006. The main one involved the creation of a joint venture with [...]* and related to online and mobile rights of BMG's non Continental-European repertoire. [...]* However, as Universal, BMG had already informed some collecting societies of these plans.
182. The most advanced model, [...]*, is the EMI initiative "CELAS" under which EMI has selected a new joint venture established by the German and the United Kingdom collecting societies for the EEA-wide administration of the EMI repertoire. At the beginning of 2006 EMI announced its agreement with the MCPS-PRS Alliance and GEMA and the joint venture has become active as of 1 January 2007. The initiative foresees that the EMI Anglo-American⁶⁰ will be offered under a single licence across Europe for mobile and online use. CELAS will be a new entity separate from the parent collecting societies and will represent the EMI rights on an exclusive basis. But CELAS, MCPRS/PRS and GEMA remain entitled to offer similar services individually to other right holders.
183. In February 2006, Warner Chappell Music launched its Pan European Digital Licensing (hereinafter "PEDL") initiative. Negotiations are still ongoing. It concerns Anglo-American online rights (Continental-European repertoire is not included). Warner intends to designate several collecting societies which have to be able to meet the standards Warner requires as its non exclusive licensing agents to grant pan-European online licences. This project therefore differs to some extent from the others, since there will not be one collecting society in charge of the licensing of the Warner repertoire but several.
184. Throughout the market investigation, some independent publishers (e.g. Chrysalis)⁶¹ have also mentioned considering the withdrawal of their online rights from collecting societies. MCPS-PRS has moreover, together with the Music Publishers Association (hereinafter "MPA"), developed a standard agreement which is supposed to allow to smaller independents an easy withdrawal and transfer to MCPS-PRS, respectively to its "Alliance Digital". The online rights are defined as telephone and online usage rights (including reproduction and distribution). Alliance Digital has sole and exclusive power to negotiate and enter into agreements with those who require licences either in the form of blanket or standard agreements, and to determine by negotiation or otherwise the terms and conditions on which licences are granted including the royalty fees. The payment of royalty by licensor is based on tariffs of country of destination.

⁵⁹ See Annex 5 provided by the parties, dated 22 January 2007, page 477.

⁶⁰ The single licence will also cover German repertoire contributed by GEMA. However, GEMA repertoire is not withdrawn in the sense described but only part of the initiative because GEMA is participating in the joint-venture.

⁶¹ See Chrysalis' response to Questionnaire to competitors (independents) 2, dated 21 December 2006, question 38.

(4) Conclusion

185. It can be concluded that the withdrawal of rights and the subsequent transfer of right to one or a few selected collecting societies is clearly a trend which is currently taking place in the industry. Universal is actively pursuing an own withdrawal initiative [...]*. The pause which was created by the merger proceedings before the Commission does not signal an end to this activity.
186. This trend however currently concerns mainly Anglo-American mechanical rights for online applications since all the initiatives described above at present only cover these rights.⁶² The following assessment will, therefore first cover mechanical and performance rights in their traditional applications and will then focus on online rights, in particular on the Anglo-American mechanical rights for online applications considering the current trend to withdraw.

2.2 Mechanical and performance rights (traditional applications)

2.2.1 Affected markets

187. The parties have provided market share estimations which are summarized in the following tables:

⁶² As a consequence of the current withdrawals, music-users will probably have to acquire separate licences for the mechanical part of the online rights and for the performance part of the online rights. Only those initiatives which select the performance right collecting society in the United Kingdom – PRS - will be able to offer a combined online licence for mechanical and performance rights for online applications with respect to the Anglo-repertoire. With respect to the American performance rights being held by ASCAP, even after withdrawal a combined licence will be possible since the authors grant a non-exclusive licence to both ASCAP and the publishers. Any publisher has therefore access to the performance rights of its own repertoire and may offer them (non-exclusively) together with the corresponding mechanical rights. With respect to BMI, the publishers only have the rights in those territories where BMI does not itself exploit the rights or has an agreement with a collecting society to do so. If BMI is not party to a withdrawal initiative, the online services will therefore have to acquire the licences for BMI-American performance rights separately from each of the EEA-collecting societies for their respective territories.

188. According to this information, the horizontally affected markets are those for

- mechanical rights in: Austria, Belgium, Finland, France, Germany, Greece, Hungary, Italy, The Netherlands, Poland, Spain, Sweden, the United Kingdom and Norway;
- performance rights in: Austria, Belgium, Czech Republic, Germany, Greece, Hungary, Italy, The Netherlands, Poland, Spain, and the United Kingdom;

189. After the merger, the parties would acquire a leading position in a number of EEA-countries. They would exceed a combined market share of 30% in Austria, Greece, Hungary, Italy, the Netherlands and Poland for mechanical rights and in Hungary alone for performance rights, followed mostly by EMI. Warner would in most cases be the third strongest competitor with Sony following in some distance as the smallest of the majors.
190. The market investigation has, however, shown that the merger does not lead to competition concerns in the markets for mechanical and performance rights due to the strong position of the collecting societies which prevents independent pricing on the part of the publishers.

2.2.2 Pricing in the system of collecting societies

191. Mechanical and performance rights in their traditional (non-online) applications are managed in the described traditional system of collecting societies. The pricing decisions in this system are made by the collecting societies which the publishers may influence only indirectly via their representation on the boards. However, most collecting societies only grant a limited share of the voting rights to the group of publishers. In the majority of collecting societies, the number of seats open for publishers is limited to one third of the total number of seats or less.⁶³ In addition, some collecting societies further restrict the number of the publishers' seats available to vertically integrated publishers which mainly affects the majors. In the Spanish collecting society SGAE, for example, three out of twelve board members are publishers, one of which may be a major. In the French collecting society SACEM, six out of 19 board members may be publishers. Among these six only two may be vertically integrated.⁶⁴
192. In most collecting societies the decisions by the board are taken by simple majority.⁶⁵ Some collecting societies indicated exceptions to this rule for some important subject matters, such as the dissolution of the collecting society or significant changes of the statutes. Only a few collecting societies reported specific rules which, however, did not create a specific advantage for the group of publishers (e.g. if the group of composers on the GEMA-board has an unanimous view, this group cannot be overruled). Since generally all votes have equal weight, the publishers formally do not have a decisive influence on the collecting societies and even less so one single publisher. Universal's formal influence will also consequently not increase after the merger.
193. A number of collecting societies have however indicated that the economic weight of the majors is significant and the dependence of the collecting societies on Universal will increase after the merger. Some market participants made reference to the so-called "Cannes Agreement", according to which the publishers reached significantly lower commission fees for the collecting societies in the framework of central licensing agreements for mechanical rights. In this respect it has to be noted, however, that with the Cannes Agreement the publishers did not influence the tariffs for users but only the

⁶³ The main exception to this is the collecting society MCPS in the United Kingdom where the majority of seats on the board are open for publishers.

⁶⁴ See Questionnaire to collecting societies 1, dated 7 November 2006, questions 6, 7 and 53: e.g. SABAM: ¼, AKM 1/3, GEMA 1/3, SACEM less than 1/3, Buma ¼, Stemra 1/3, STIM 1/3, SGAE ¼.

⁶⁵ See Questionnaire to collecting societies 1, dated 7 November 2006, question 7.

commission fees retained by the collecting societies for their administration services. The tariffs themselves are set by the collecting societies. This derives mainly from the fact that collecting societies are bound by a number of legal provisions in their pricing which does not only limit the collecting societies but also any publisher's influence on the tariffs. The main provision is the non-discrimination principle which will be described in more detail in the following.

194. While the parties' economic weight will become larger after the merger, this will not allow Universal to price independently. The licensing tariffs may not under the current rules differ per publisher. It is therefore unlikely that the parties could impose price increases for mechanical and performance rights for traditional applications after the merger.
195. Due to their dominant positions, the collecting societies are regularly obliged to charge non-discriminatory tariffs. As a result, under the current system, they normally may not charge different tariffs to the right-users – differences in tariffs only apply (on a non-discriminatory basis) with respect to the different forms of exploitation. The music of all member authors and publishers is normally covered by a blanket licence which defines a uniform price for all titles and users of one right category.
196. The merger will also not give Universal the possibility to influence the collecting societies to change this system in its own favour. In most cases, the non-discrimination obligation is based on competition law as well as on the respective national copyright laws.⁶⁶ Remaining in the traditional system of collecting societies, it can therefore not be expected that Universal could after the merger impose higher prices for the own repertoire regarding mechanical or performance rights (traditional application).

2.2.3 No withdrawals of mechanical and performance rights for traditional applications

197. While significant changes to the rights administration are taking place for online rights, no such developments can currently be observed for mechanical and performance rights for traditional applications. While some collecting societies have mentioned the possibility of a parallel development occurring in the future in respect of mechanical and performance rights for traditional applications as in online rights, the market investigation has not indicated that any withdrawal initiatives are planned with respect to the traditional fields of applications in the near future.
198. It can be assumed that the withdrawal of mechanical and performance rights for traditional applications is more difficult than the withdrawal of online rights. In particular for performance rights, a withdrawal might be difficult due to the monitoring and collection of royalties from the numerous small and geographically widely dispersed customers, such as restaurants, bars and discotheques. The administration of these rights would continue to require a high degree of local presence in the countries where the customers are located whereas online rights can to a significant extent be administered via the internet. For a withdrawal of such rights, the assistance of most collecting societies would still be needed since each collecting society has for its own country the information about the users as well as the necessary monitoring network.

⁶⁶ See Questionnaire to collecting societies 3, dated 5 February 2007, question 3a.

199. It is, moreover, worth noting that in the current system of the mechanical rights management the large record companies have in the past succeeded in significantly decreasing the commission fees which are retained by the collecting societies and in establishing so-called "central licensing agreements" which constitute European-wide licences granted by a selected collecting society. As opposed to the withdrawal initiatives in online rights, these multi-territorial licences are, however, based on agreements between the relevant collecting societies and are thereby integrated into the traditional collecting societies' system. Due to the better terms and the easier European-wide administration of mechanical rights, the incentives for the vertically integrated music companies to withdraw those rights have to be considered as lower than it is the case for online rights.
200. As described above, the publishers could in essence only withdraw Anglo-American mechanical rights on their own initiative, since only those are regularly assigned to them by the authors. All other rights (performance rights, mechanical rights for Continental European repertoire) are normally assigned by the authors to the collecting societies. Any withdrawal of those rights by the publishers would normally require the authors' approval. Given that the approval of thousands of authors would be necessary a withdrawal of performance rights and Continental-European mechanical rights does not seem likely.
201. But even for Anglo-American mechanical rights for traditional applications a withdrawal cannot be expected in the foreseeable timeframe. All current initiatives focus on online rights. According to one major publisher, the online initiative has already required a huge amount of preparation over the past year. No publisher indicated to currently pursue any such plans for the "offline" rights (mainly Anglo-American mechanical rights). It can be assumed that any potential initiative to withdraw "offline" rights (mainly Anglo-American mechanical rights) in the future would require again a significant amount of time for planning and preparation. Several independents have indicated that a withdrawal of mechanical rights (in their traditional applications) could be in principle feasible for Universal. However, they also mention that mechanical rights account for approximately half of the publishers' turnover, and that any such move would if at all only be decided upon when the currently initiated change for online rights is firmly established. Given these indications, any such step therefore does not appear likely.
202. It can also not be assumed that the merger increases the incentives for Universal to withdraw mechanical rights for traditional applications where it is possible. Both Universal and BMG had indicated already before the merger that they would withdraw their online rights. Equally, a number of independents are currently withdrawing. Consequently, the size of the publisher does not seem to be essential to the decision to withdraw and transfer the rights to a selected collecting society. In any case, any potential minimum size is apparently already reached by the larger independents. The merger therefore cannot be considered to have a decisive effect in this respect.
203. While the possibility of a withdrawal of at least mechanical rights for traditional applications (Anglo-American repertoire) cannot be completely excluded in the long-term, it cannot be assumed as a probable development in the foreseeable timeframe.

2.2.4 Effects of the merger on mechanical and performance rights

204. Against this background, it is not likely that the merger could lead to competition concerns and to an increase in prices for licences for mechanical and performance rights

(traditional applications). The control over the pricing is to a large extent in the hands of the collecting societies and not in the hands of the publishers. No change to this system can currently be expected in the near future. The merger therefore does not lead to a significant impediment of effective competition in the markets for mechanical and performance rights.

2.3 Online rights

2.3.1. Scope of the analysis

(1) Serious doubts in the market for online rights

205. The merger raises serious doubts in the market for online rights, which are composed of mechanical and performance rights for online applications (including mobile). The concerns mainly relate to the mechanical rights part of the online rights and to Anglo-American repertoire. However, a price increase in this segment will have an appreciable effect on the overall market for online rights. The role of performance rights would be neutral since they are likely to remain in the traditional system of collecting societies who have an obligation to license at non-discriminatory terms.
206. Online rights have so far been administered by the collecting societies. The recent major restructuring of the market in which publishers withdraw online rights from the traditional collecting societies' system affects in particular the mechanical rights part of these online rights. Due to the specificities of the rights administration in the Anglo-American countries as described above, such withdrawal is currently easier with respect to Anglo-American repertoire. The current withdrawal initiatives are subsequently focused on Anglo-American mechanical rights for online use.
207. In the traditional collecting societies system the collecting societies are responsible for the pricing of licences which the publishers can influence only via their representation on the collecting societies' boards. The withdrawal shifts pricing power to the publishers who gain pricing independence with respect to the withdrawn rights. In this restructured market, the merger may lead to a significant impediment of competition due to unilateral effects leading to an increase in prices as compared to the situation in the restructured market without the merger.
208. The following analysis therefore assesses the effects of the merger on competition in the new licensing environment envisaged. It does not assess any effects of the withdrawal of rights from the traditional collecting societies' system as such, but neutrally considers the current developments as facts determining the relevant competitive situation in which the merger takes place. The withdrawal from the collecting societies system is the framework which allows the publishers to price independently. After the withdrawal, the collecting societies system and the corresponding regulatory framework cannot prevent a price increase resulting from the merger in this restructured market environment.

(2) Development of the online music market

209. Online rights are an input for the provision of online music services to end-customers. Online music providers, such as downloading services, need to acquire the licences for the necessary online rights in order to be able to offer the respective music titles on their platforms. The licensing of online rights to online music providers is therefore an

upstream (wholesale) market to the (retail) market of online music services to end-customers.

210. The volume of the upstream market for online rights depends on the size and development of the downstream market for online music services to end-customers. Since the revenue from licensing of online rights is generally a percentage of the revenues the online music providers make by selling online music services to the end-customers, the current size and the prospective growth of that market result in a corresponding development of the market for the licensing of online rights.
211. The online rights market is currently still very small which is due to the fact that the provision of online music services to end-customers is still in a very early stage of development. The total market volume of publishing online rights in the EEA is estimated by the parties at EUR [20-30]* million for 2005. According to the notifying party, online rights represented approximately 2% of the parties' total publishing revenues in 2005. A similar share appears to apply to the total downstream market: According to the report "Interactive content and convergence: Implication for the Information Society"⁶⁷, the total revenues made on the market for online music services to end-customers (EUR 196 million in 2005) also represent approximately 2% of the total music revenues.
212. It is, however, undisputed that the market for online music services to end-customers will grow significantly in the next years and will be of critical importance for the overall future music market. The "Commission staff working document – study on a community initiative on the cross-border collective management of copyright"⁶⁸ indicates a considerable estimated growth of online music revenues until 2008. The total online music revenues in Western Europe in 2004 are indicated as EUR 27.2 million. The estimation for 2008 is EUR 559 million. In the US the market volume was already EUR 207 million in 2004 and the estimated revenue for 2008 is EUR 1 270 million.
213. Also according to International Federation of the Phonographic Industry ("IFPI"), online music is still in an early phase of development but grows at high rates. Considering only recording revenues, IFPI states that revenues by record companies in the online music business have doubled worldwide in 2006 to US-\$ 2 billion. They are now around 10% of the total recorded music sales (after 5.5% in 2005) and are expected to grow to at least 25% by 2010. In Europe, the number of single tracks downloaded has according to IFPI increased by 80% between 2005 and 2006.⁶⁹
214. In March 2007, Vivendi reported for Universal digital sales in 2006 "strong growth in all markets and sectors". Universal's digital revenues were up [50-100]*% versus 2005 and

⁶⁷ See Interactive content and convergence: Implication for the Information Society – A study for the European Commission, Final Report October 2006, pages 31 and 36. The same study forecasts a growth of total online and mobile music revenues to €1.8 bn by 2010, i.e. a multiplication by more than the factor 9.
http://ec.europa.eu/information_society/europe/i2010/docs/studies/interactive_content_ec2006_final_report.pdf

⁶⁸ See Commission staff working document - study on a community initiative on the cross-border collective management of copyright, 7 July 2005, page 6, referring to Rightscom, DRM and Services in Europe and the US, 2005.

⁶⁹ See International Federation of the Phonographic Industry; IFPI:07 – Digital music report: http://www.ifpi.org/content/section_resources/digital-music-report.html

represented [0-10]*% of its total revenues.⁷⁰ In its "2007 Outlook" Vivendi states that regarding Universal's revenues (even excluding BMG Publishing) a "strong release schedule and digital sales growth are expected".⁷¹

215. The above mentioned report "Interactive content and convergence: Implication for the Information Society"⁷² similarly forecasts that online music revenue which currently represents 2% of the total music revenues will in 2010 represent a share of 20.4%. This assumes that the online music market will be multiplied by 9 between 2005 and 2010. Applying this growth rate to the publishing market for online rights, it is estimated that this market will reach a value of EUR 230 million in Europe. This is in line with the forecast of the International Music Publishers Association (IMPA) which gathers the 5 current majors. Considering that the US and Europe have similar sized overall music markets, IMPA expects that the European digital market (which is currently 7 times smaller) should be similar to the US digital market.⁷³

(3) Steps of the assessment

216. The analysis focuses on unilateral effects of the merger on the market for online rights and in particular on the mechanical rights portion of those online rights for Anglo-American repertoire. It follows three main questions:
- **Independence in pricing:** After the restructuring of the administration of the online rights by the described withdrawal initiatives, will the publishers be able to price independently from the collecting societies and the regulation applicable to them?
 - **Increase in market power:** Will the merger increase Universal's market power in the market after restructuring vis-à-vis the online right users as compared to the restructured situation before the merger?
 - **Profitability of a price increase:** Is it likely that Universal will be able to profitably increase prices or will the reactions of other market participants offset the positive revenue effect and therefore render a price increase unprofitable and unlikely?

2.3.2 Independence in pricing

217. As a result of the withdrawal initiatives in the online rights market, the publishers are gaining control over the licensing tariffs. Despite the remaining future involvement of collecting societies in the current withdrawal initiatives the publishers are likely to exert direct influence on the pricing of their withdrawn repertoire.

⁷³ See Annex 5 provided by the parties, dated 22 January 2007, page 307.

(1) *The changing role of collecting societies*

a. The traditional role

218. So far, the collecting societies have been responsible for the licensing of mechanical, performance and online rights and the corresponding definition of the exact terms of licensing. In the traditional system, for most uses they issue blanket licences which cover the complete repertoire administered. Collecting societies are mostly considered as being dominant in their respective territories due to the reciprocal agreements which essentially prevent any competition between the collecting societies and restrict their activities to the own country. On this basis, special rules apply to them in most Member States. These rules consist (i) of the general principles of non-discrimination and equal treatment which the collecting societies derived from the requirements of competition law and (ii) of specific regulation in some countries.
219. Specific regulation: The parties have provided an overview of the different national conditions prevailing in this respect and have shown that there are different mechanisms in the affected territories which influence the setting of royalty rates, which has generally been confirmed by the market investigation. The mechanisms range from specific bodies with jurisdiction to approve or set rates to arbitration bodies. The nature, jurisdictional scope, and respective powers of these mechanisms vary among the affected territories. According to the parties, there is a level of uncertainty regarding the exact scope of application of these mechanisms especially in relation to new and emerging licensing platforms for pan-territorial licences, in particular for the online exploitation of music.⁷⁴
220. The parties indicate mechanisms with specific jurisdiction over royalty rates in Austria, the Czech Republic, Germany, Hungary, Greece and the United Kingdom⁷⁵. These Member States have in common that the rules provide for arbitration mechanisms rather than for any direct tariff regulation as it is the case for regulated industries, such as telecoms. Only in Hungary is an approval of the tariffs by the Ministry of Culture required. Moreover, the arbitration procedures in the other countries only become effective when users dispute tariffs charged by the collecting societies before the courts or specific arbitration bodies.⁷⁶

⁷⁴ See response by the parties' to the questionnaire to the parties, dated 7 February 2007.

⁷⁵ In Spain, there is only a mechanism which is entirely voluntary and in the Netherlands, there is a body which can only make non-binding recommendations.

⁷⁶ The parties provided the following information on the individual countries:

- *Austria*: The Verwertungsgesellschaftengesetz 2006 (the VGG) determines the conditions under which the collecting societies AKM and austro mechna operate. The usual way for setting a tariff is for the Austrian collecting societies to conclude "collective agreements" with representative organisations of users. A specific arbitration mechanism exists where negotiations for a collective agreement are unsuccessful. Where this arbitration fails, either party is entitled to apply to the "Copyright Senate" ("Urheberrechtssenat") which will decide on the appropriate tariff.
- *Czech Republic*: Collecting societies in the Czech Republic must be authorized by the Ministry of Culture which supervises the activities of those societies. The Czech collecting society OSA is obliged to set adequate tariffs which apply equally to all users. Users may ask the Ministry of Culture to review the rates.

221. Non-discrimination principle: Apart from these specific regulation, the general non-discrimination principle is applied by the collecting societies as stipulated in their statutes and membership agreements. According to this principle they may not treat users differently for comparable forms of music applications. As a result, tariffs only differ per category of use but not per user. The collecting societies also apply the policy of charging one price for the whole repertoire. Therefore, no differentiated pricing for the publishers' or authors' repertoires applies in the traditional collecting societies system.
222. In the traditional collecting societies system, the publishers do consequently not have any direct influence on these tariffs. Since the licences and tariffs cover the complete repertoire no publisher-specific tariffs exist. In this system as described above, the publishers are able to influence these terms only via their representation on the boards of the collecting societies which does not, however, in most collecting societies entail any decisive control for the publishers. Consequently, the individual publishers do not have control over prices of their individual repertoires as the control is with collecting societies.

b. The change brought about by the withdrawal trend

223. The restructuring of the market provides for a new role for the collecting societies and a new relationship between publisher and collecting society in the field of the withdrawn rights. This new role is determined by the newly introduced competition between collecting societies for right-holders. Due to the withdrawal from the traditional collecting societies system, collecting societies will (for the withdrawn rights) adopt a role as agents and service providers for the publishers and will no longer act in the traditional sphere of the usual membership agreement and collecting societies' statutes.
224. After the withdrawal of rights, the collecting societies will compete with one another for the administration of online rights. Universal provided presentations made by several collecting societies which presented their offers for the administration of online rights to the publishers.⁷⁷ Moreover, an own internal presentation indicates that Universal met with [...] in this matter.⁷⁸ It is clear that these collecting societies have to make an offer to the publishers which complies with their wishes. The Dutch collecting society BUMA-Stemra summarizes the new competitive situation: "Rights holders will evaluate

-
- *Germany*: In Germany, users can appeal against tariffs set by GEMA to the Arbitral Tribunal at the Patent Office which may alter this tariff.
 - *Greece*: In Greece, users who consider tariffs set by AEPI as too high may request a court of first instance to set an adequate tariff. In addition, the Ministry of Culture has the power to act on complaints regarding tariffs.
 - *Hungary*: Royalty rates set by the Hungarian collecting society Artisjus are subject to Ministerial approval. Users may turn to an arbitration board, which can propose a new tariff. If the parties to the dispute do not agree to this proposal the tariffs of the previous year remain applicable.
 - *United Kingdom*: In the United Kingdom, the Copyright Tribunal is responsible for the determination of disputes arising between licensing bodies and users. The Copyright Tribunal may set the terms that are "reasonable". It has the authority to confirm or vary the pricing scheme.

⁷⁷ See Annex 5 provided by the parties, dated 22 January 2007, section 1.

⁷⁸ See Annex 5 provided by the parties, dated 22 January 2007, page 466.

the services delivered by their society and compare these to services provided by other European societies. The most attractive society to a rights holder will be the one that best represents the online music rights of the rights holders, based on efficiency and service."⁷⁹ On the basis of such competition between the collecting societies, the publishers select one or a few collecting societies for the administration of their rights. The respective publishers base their cooperation with respect to the withdrawn rights on new, individual agreements with the selected collecting society which define the specific terms of the administration of the withdrawn rights beyond the usual membership agreements.

225. In the restructured market, it is therefore very likely that the publishers will have decisive influence on the tariffs for their withdrawn rights. The publishers can no longer be considered as one of many members in a collecting society with only limited influence on the conditions of licensing. Due to the process of 'tendering' their rights, the publishers gain a position which shifts control over the conditions of licensing from the collecting societies to the publishers who have the possibility to terminate their cooperation with the selected collecting societies and to switch to another one if they are not satisfied with the conditions and services offered. This view is also reflected by IMPA (International Music Publishers Association) which refers in a presentation to Option 3 of the Commission Working Paper and states that "Option 3 changes relationship between societies and rights holders – Option 3 gives rights holders the ability to negotiate terms on which societies can license our rights and to protect rates"⁸⁰.
226. This was further confirmed by the responses to the market investigation. When asked whether the publisher or the selected collecting society will decide on the tariffs of the withdrawn rights in the future, several collecting societies indicated that the conditions would depend on the agreements between the selected collecting society and the individual publisher.⁸¹ The Belgian collecting society SABAM indicates, for example, that "Due to the shifted balance of power and the fact that instead of a collective of right-owners one single publisher will be represented, the collecting society will operate more as an agency for the publisher than as a true collecting society. In such a case, the concerned publisher will determine the conditions against which this repertoire will be licensed."⁸² In the same way, the German collecting society GEMA confirms that the tariff conditions will be agreed between the selected collecting society and the publisher.⁸³ Equally SACEM, the French collecting society, states that if selected by a major publisher, SACEM would have to apply the specific tariff required by the respective publisher.⁸⁴ Both GEMA and SACEM have already been in negotiations with one or

⁷⁹ See Annex 5 provided by the parties, dated 22 January 2007, page 16.

⁸⁰ See Annex 5 provided by the parties, dated 22 January 2007, page 317.

⁸¹ See collecting societies' responses to the Questionnaire to Collecting Societies 3, dated 5 February 2007, question 7d.

⁸² See SABAM's response to the Questionnaire to Collecting Societies 3, dated 5 February 2007, question 7d.

⁸³ See GEMA's response to the Questionnaire to Collecting Societies 3, dated 5 February 2007, question 7d: "In diesem Fall ist davon auszugehen, dass die Tarifbedingungen bereits in der Vereinbarung zwischen dem jeweiligen Verleger und der Verwertungsgesellschaft festgelegt werden."

⁸⁴ See SACEM's response to the Questionnaire to Collecting Societies 3, dated 5 February 2007, question 3e (applicability of the non-discrimination rule for withdrawn rights): "La SACEM aurait à appliquer le tarif

several major publishers on the administration of withdrawn rights. It can be assumed that their replies reflect their experience resulting from those negotiations. Their statements are in line with MCPS-PRS' explanation that the right-holder will select an agent on the terms offered to him which he feels best represents his interests and is free to switch to another agent (collecting society) if his interests are not properly represented by the one initially selected.⁸⁵

227. While many other collecting societies indicate that the tariffs would depend on the agreement between the publisher and the selected collecting society, a few of them stated that they would also be the ones deciding on the tariffs in the restructured market and with respect to withdrawn rights transferred to them according to the rules currently determined by the membership agreements and statutes (OSA, AEPI, Artisjus)⁸⁶. As far as the Commission is aware, none of those respondents are currently among those which are in detailed discussions with the major publishers or even selected for the EEA-wide administration of the mechanical part of their online rights.
228. Market participants other than the collecting societies share a similar view of the future pricing power over withdrawn rights as shown by the statement of one online music provider: "The withdrawal by publishers of their repertoire from the system of blanket licences has the effect of removing the pricing power from collecting societies and therefore from national copyright authorities and tribunals. In other words, insofar as access to the global repertoire is essential for users such as broadcasters and providers of music streaming services (one cannot for example have a call-in program where one only plays songs owned by certain publishers), the publishers are acquiring full and unfettered pricing power in relation to users."⁸⁷
229. It can be concluded that the collecting societies will no longer have the same pricing power as in the traditional collecting societies system as regards the withdrawn rights. On the basis of competition between the collecting societies, this power over the pricing will shift to the publishers.

(2) Applicability of regulatory provisions after withdrawal

230. The publishers' independence in pricing will also not be prevented by regulatory provisions existing for collecting societies. All current initiatives include the participation of one or a few collecting societies. The market investigation has shown that the current provisions will most probably not apply equally to the new initiatives. This conclusion is also implicitly confirmed by the response of EMI, a music publisher which has conferred inter alia its Anglo-American repertoire to CELAS, a joint venture of GEMA and MCPS-PRS. In its assertion that music publishers would not be able to price their copyrights

spécifique exigé par l'éditeur si ce dernier lui confiait la gestion de ses droits dans le cadre d'un mandat particulier distinct des apports de droits normalement effectués à la SACEM par ses membres, mandat donnant à l'éditeur en cause la possibilité de spécifier des conditions particulières d'exploitation de son catalogue différentes de celles définies par la SACEM pour ses propres membres."

⁸⁵ See MCPS-PRS' response to the Questionnaire to Collecting Societies 3, dated 5 February 2007, question 7d.

⁸⁶ See questionnaire to collecting societies 3, dated 5 February 2007, question 7d.

⁸⁷ See fax registered as document 2759 on 1 February 2007, page 3 (name of respondent confidential).

independently, EMI does not at all refer to any regulation preventing the publishers from doing so.⁸⁸

231. As described above, in the traditional system collecting societies are normally considered as dominant and consequently apply the principle of non-discrimination. In addition, in a few countries there is specific regulation – mostly arbitration procedures in case of complaints. In the new initiatives pan-European licences are intended to be granted by a national collecting society selected by the respective publisher. The market investigation has shown that it is highly unlikely that the selected collecting societies will with respect to the administration of the withdrawn rights be bound to the non-discrimination principle and to any country-specific regulation to the same extent as in the traditional system.

a. Non-discrimination

232. In the new initiatives, the collecting societies are selected by the publishers as service providers. As described already earlier, they do not act anymore as the traditional collecting societies but as agents for the publishers. By concluding new agreements different from the usual membership agreements, those membership agreements and consequently the statutes of the collecting societies concerning the membership will no longer fully apply with respect to the withdrawn rights.

233. While the collecting societies traditionally have had the control over the rights administered, they will in the future rather take the role of service providers to the publishers with respect to the withdrawn rights. In essence, the publishers will buy administration services from the collecting societies while keeping the ultimate control over the rights. The market power held by the collecting societies will therefore in this respect shift to the publishers. It is unlikely that this will still require the application of non-discrimination principles by the collecting societies with respect to the withdrawn rights.

234. This is also reflected in the agreements drafted for the new initiatives which reflect the expectation that a collecting society acting only as a service provider to a publisher will not be bound to the non-discrimination principle as the publisher would also not be bound when licensing directly: [...] allows for example in its draft agreement with [...], the application of different tariffs for right users [...]⁸⁹.

b. Specific regulation

235. Similar considerations have to be made with respect to specific regulation prevailing for collecting societies in the traditional system as described in general terms in paragraph above. While the licences can cover several countries, the specific regulation which is based on national laws does not apply fully to such multi-territorial licensing. With respect to the specific regulations, the questions may be raised whether (i) the regulation in the country in which the collecting society is located will also apply to users abroad and (ii) whether collecting societies granting licences in other countries for uses in these other countries would be bound by regulation there.

⁸⁸ Response of EMI to the Commission's questionnaire of 15.03.2007, p. (i).

⁸⁹ See [...].

236. (i) Applicability of regulation to users abroad: For most of the described regulation, the parties are of the view that it would also apply to users which are not located in the respective countries. The parties moreover indicate that such cases have never been tested, since to date the collecting societies have not granted EEA-wide licences.⁹⁰
237. The market investigation has not fully confirmed the notifying party's analysis. The collecting societies were asked whether any existing regulation relating to tariffs would equally apply to users in other countries acquiring a European-wide licence. The large majority of the collecting societies did not fully support the suggestion that the provisions applicable to users in the own country would equally apply to users acquiring a licence for the use of rights in other countries. The answers mostly either clearly rejected this possibility, stated that no tariff regulation existed in general or indicated that the legal situation was not clear.⁹¹
238. Of the countries identified as having some form of tariff regulation, it appears that particularly far-reaching provisions exist in the United Kingdom. The collecting society MCPS-PRS considers that the Copyright Tribunal's jurisdiction may be limited to licences concerning the exploitation of rights in the United Kingdom.⁹² This would mean that users who are located outside of the United Kingdom might be covered by the regulation in the United Kingdom, but only with respect to their activity in the United Kingdom. Since those users would have to be considered as British users rather than as foreign users, the statement of MCPS-PRS does in essence not confirm that users acquiring an EEA-wide licence for the use of music outside of the United Kingdom would be covered by the existing regulation.
239. Also the majority of collecting societies in those countries which were identified by the parties as having some form of tariff regulation, did not support the applicability of this regulation to users in other countries. According to GEMA for example, this question will depend on whether the applicability of the German law will be agreed upon in the contract between the publisher and the respective collecting society and whether it would be admissible to agree on such applicability according to the principles of international law. The Austrian collecting society in charge for mechanical rights Austro Mechana clearly rejected such applicability, while its counterpart for performance rights, AKM, indicated that there is no clear provision concerning the applicability of regulation to EEA-wide licences. A confirmation of the international applicability of the national tariff regulations

⁹⁰ The parties also did not indicate any cases which might have already touched upon this issue in the framework of the Santiago agreement which allowed for EEA-wide licensing and expired at the end of 2004. It seems, however, that the EEA-wide licensing on the basis of the Santiago agreement differs significantly from the EEA-wide licences envisaged after withdrawal and that any potential examples in this respect might not be applicable for the new initiatives. The Santiago agreement was concluded between a number of collecting societies granting each other the right to issue multi-territorial licences. The Santiago agreement was therefore no withdrawal from the traditional collecting societies system – it can rather be regarded as an addition to the traditional model in which the control over licenses and pricing remained fully in the collecting societies' hands.

⁹¹ See the collecting societies' reply to Questionnaire to collecting societies 3, dated 5 February 2007, question 6 c (applicability of regulation to European-wide licensing).

⁹² See MCPS-PRS' reply to Questionnaire to collecting societies 3, dated 5 February 2007, question 6 e.

was also not received from OSA (Czech Republic), AEPI (Greece) and Artisjus (Hungary).⁹³

240. (ii) Applicability of regulation to collecting societies abroad: It is moreover, unlikely that the specific regulations existing in some Member States would equally apply to the collecting societies being selected for the EEA-wide administration of rights.
241. Some respondents to the market investigation indicate that any specific regulation on tariffs would only apply to a foreign collecting society if this collecting society could – in case it granted licences in another country – still be defined as a collecting society under the national laws in the country of the right-user. In most countries, several conditions have to be fulfilled in order to qualify as a collecting society (for example, administration of rights for more than one right-holder, non-profit making organisation). Moreover, special accreditation often has to be granted by the authorities in charge. In some countries, it is very likely that no other organization could work as a formally acknowledged "collecting society". In Austria, for example, only one collecting society can obtain an operating licence for the administration of a specific category of rights⁹⁴. Further, the Hungarian collecting society Artisjus confirmed that a foreign collecting society could only act as agent in Hungary, since only Artisjus qualifies as collecting society.⁹⁵ In Italy, SIAE is appointed by law to act as a collecting society. While this does not prevent any publisher from licensing the own rights directly and independently or via a selected agent, it shows that the role of a traditional collecting society representing many different right-holders and its specific regulation is reserved for very specific organizations.
242. Apart from this, a number of respondents indicated that also a foreign collecting society granting licences in the own country would have to generally respect the law of this country. This affected mostly countries in which no specific tariff regulation exists.
243. The parties' analysis does not lead to a different result. For most countries, the parties find that the national rules would theoretically apply to a foreign collecting society if it qualified as a collecting society under these national rules. The parties indicate that this qualification may in some countries only be achieved if the organization is located in the respective country or may be excluded completely since this status is reserved for the established collecting society (e.g., Germany, Hungary, Italy). The parties state that regulation would probably apply also to foreign collecting societies only in the United Kingdom and the Czech Republic. MCPS-PRS considers that a licensing body would not necessarily have to be located in the United Kingdom to fall under the regulation in the UK indicating at the same time that there is no decided case on this issue.⁹⁶
244. It can be concluded, that the legal provisions are clearly aimed at the current traditional collecting societies system and do not take into consideration any EEA-wide licensing

⁹³ See the collecting societies' replies to Questionnaire to collecting societies 3, dated 5 February 2007, question 6 c.

⁹⁴ See parties' reply to the Questionnaire to the parties, dated 1 February, paragraph 3.2.6.

⁹⁵ See Artisjus' reply to the Questionnaire to collecting societies 3, dated 5 February 2007, question 6e.

⁹⁶ See MCPS-PRS' reply to the Questionnaire to collecting societies 3, dated 5 February 2007, question 6e.

activity. The results of the market investigation show that the future structure of the online licensing market is accordingly not considered in the various national laws. It is therefore unlikely that the national regulation (where it exists for the national collecting societies) will "neatly" apply to the EEA-wide licensing activities of the collecting societies being selected and acting as service providers for the publishers. This is even more unlikely if new entities are established by the collecting societies (and the publishers) for the EEA-wide administration of rights. The fact that the publishers are aiming at an EEA-wide tariff for the withdrawn rights as described above shows that a deviation from the standard rates for the withdrawn repertoire is considered as possible. This is also confirmed by the market investigation. When asked whether it can be expected that the new initiatives may apply tariffs for the withdrawn rights in the future which are different from those which are not withdrawn, the majority of collecting societies answered yes.⁹⁷

(3) Tariff provisions in Universal's current initiatives

245. In the restructured market and on the basis of the new role of the collecting societies, the publishers will via individual agreements be able to control the pricing over the own withdrawn rights and either define the tariff conditions directly or design approval procedures in the agreements with the selected collecting society. [...]*
246. The notifying party has been in contact with [...] regarding the EEA-wide administration of Universal's withdrawn rights. [...] ⁹⁸ [...] ⁹⁹.
247. While [...]*, the current initiatives mainly stipulate that for the time being, the current rates will continue to apply ("country of destination tariff"). This does not contradict the pricing power by the publishers. The use of the country of destination tariffs reflects the current transition period of this market which needs some time to develop. It is clearly a voluntary decision by these publishers who choose to stay with the old rates for a certain time. This decision does not reflect the absence of pricing independence, but rather confirms it. It would not be necessary to state in the new agreements the application of these tariffs if the selected collecting society would still be the one setting the tariffs in accordance with the traditional system of membership and reciprocal agreements.
248. It can be expected that the collection of local tariffs will be in the near future exchanged by a new EEA-wide tariff. The parties indicate for example [...]* that it is envisaged to establish an EEA-wide tariff.¹⁰⁰ MCPS indicates on its website, that the country of destination principle applies for withdrawn rights making clear at the same time that this is intended to be used only "initially"¹⁰¹. MCPS moreover indicates [...]* that:

⁹⁷ See the collecting societies' replies to Questionnaire to collecting societies 3, dated 5 February 2007, question 7f: Of 13 replies to this question, 8 collecting societies indicated yes, 3 indicated no and the answers of 2 collecting societies was not clear.

⁹⁸ See [...]*, Annex 5 provided by the parties, dated 22 January 2007, page 237.

⁹⁹ See [...]*

¹⁰⁰ See [...]*, Annex 5 provided by the parties, dated 22 January 2007, page 301 and the [...]*, Annex 5 provided by the parties, dated 22 January 2007, page 205.

¹⁰¹ See under <http://www.mcps-prs-alliance.co.uk/>- Licensing the future - Question and Answers.

"Obviously, there are significant practical difficulties in applying the ToD [Territory of Destination] principle in the online sphere [...] it inevitably leads to a very complex royalty structure in any pan territorial licence. One solution is obviously harmonized rates. [...] it could therefore be abandoned [...] MCPS-PRS and Rights Holders would then have an opportunity to control the tariffs on a Europe-wide basis. As indicated elsewhere in this response, the route to achieving purely repertoire-based licensing may not be immediate but until that point, however, ToD is a principle that should be retained."¹⁰²

249. It is therefore realistic to assume that an EEA-tariff for each specific repertoire ("repertoire-based") is intended which deviates from the country of destination tariffs, which shows the publishers' pricing independence compared with their situation in the traditional collecting societies' system. It can be questioned why [...]*. This is also confirmed by responses from the market. When asked whether in the current withdrawal initiatives the country of destination tariff will apply, SABAM for example indicates that the "risk" of tariffs in function of the repertoire exists.¹⁰³ SACEM also notes that withdrawals have as an aim the increased influence of the publishers on the tariffs.¹⁰⁴ Taking into account the difficulties which MCPS sees with respect to the country of destination tariff, it can be expected that the aim of an EEA-wide tariff will be pursued in the near future. The current focus on the old rates before the merger does not at all exclude a new pricing policy by Universal after the merger, which will allow for larger pricing power vis-à-vis the users and will therefore also create stronger incentives to apply an own rate.

(4) Conclusion

250. It can be concluded, that in most countries no explicit application of the national rules for international licences is considered. Many legal uncertainties as to the international applicability of national rules remain in most countries. It is therefore very likely that with the withdrawal of rights from the traditional system of collecting societies, the publishers will gain pricing independence with regard to their repertoire or may obtain it. Due to the limited applicability of specific national rules, it is also unlikely that existing regulation (where it exists) will be able to limit the enhanced pricing power of the parties on EEA-wide level in the foreseeable future environment.

2.3.3 Increase in market power

251. In the foreseeable licensing environment as described above, the proposed concentration is likely to significantly increase Universal's market power vis-à-vis the providers of online and mobile music services. This market power of the merged entity results from the heavy dependence of most¹⁰⁵ of these music providers on access to Universal's and BMG's music publishing rights and on Universal's recording rights. As a consequence of

¹⁰² See[...]*, Annex 5 provided by the parties, dated 22 January 2007, page 58.

¹⁰³ See SABAM's response to the Questionnaire to collecting societies 3, dated 5 February 2007, question 7a.

¹⁰⁴ See SACEM's response to the Questionnaire to collecting societies 3, dated 5 February 2007, question 7a.

¹⁰⁵ The Commission acknowledges the existence of some niche players such as E-Music specialising in repertoire of independents. However, the market investigation has shown that vast majority of the online and mobile music providers rely on the repertoire of the majors.

the proposed concentration, Universal will (co-)control publishing rights as regards a large number of the best-selling titles. This high control share of music publishing rights is further entrenched by Universal's strong position regarding recording (neighbouring) rights. In view of the specific features of the online and mobile music providers' demand it appears likely that Universal will be able to use its strong positions in both recording and publishing to exert pressure on online and mobile music providers and to impose higher rates.

(1) Features of demand of online and mobile music providers

a. Need to secure both publishing and recording rights

252. Any provider of online or mobile music needs licences for both the recording and the publishing rights for all titles it proposes on its platform.¹⁰⁶ Whilst publishing rights relate to the copyright of the author(s) in the "abstract" lyrics and melody of a work, the recording rights cover the rights of the performing artist in a specific recording of that song. The same work (melody and lyrics) may thus be recorded several times by different singers, for instance as "cover versions". If a provider offers music without having secured all necessary rights for a song it runs the risk of litigation and damage claims on the part of the right owners. In the absence of such licenses for the relevant recording rights and for the relevant publishing rights of a title, an online or mobile music service provider cannot offer that title and the title will thus normally not be available on that platform.
253. So far, online and mobile music providers have regularly acquired licences for the music publishing rights from the collecting societies and licences for music recording rights directly from the record companies. In the new environment as described above, music publishing rights of a given publisher will be only available from one single organisation (e.g. CELAS for EMI) or a limited number of organisations or collecting societies which administer the online rights of that publisher. As explained above, these organisations or selected collecting societies are rather acting as agent or service provider on behalf of their "principal" publisher which will determine the licensing terms and conditions. The licensing of music publishing rights is thus developing from a collective licensing towards an individual licensing and will thus converge towards a licensing model similar to the licensing of music recording rights.
254. The market investigation indicates that in some cases major record companies with large record repertoires and high market shares have succeeded in imposing higher licensing rates for recording rights than smaller major record companies. The online and mobile music providers which reported such rate differences referred to the higher bargaining power of those majors with higher market shares as their catalogues are of greater importance for an online and mobile music provider. In addition, several online or mobile music providers stated that record companies have refused or delayed wholesale licences

¹⁰⁶ This is also recognised by Universal: see paragraph 105 of the form CO. Ringtones as pure melodies (without performance) should normally not require a recording rights licence. However, according to the market investigation, even ringtones seem to require recording rights licences. In any event, even if ringtones were not to require recording rights licences, the following analysis would not be altered: ringtones are only one of several mobile music applications and not the most important one. In addition, they are losing relative importance as compared to mastertones and mobile audio and video downloads and streaming which have higher growth rates and all definitely require recording rights licences.

in the past. Some providers indicated that record companies have delayed the licensing of their repertoire in order to achieve higher rates. It is noteworthy that such behaviour has only been possible with respect to recording rights as publishing rights have so far been licensed by collecting societies.

255. In the restructured environment Universal as an integrated music company will directly and indirectly license both the recording and publishing rights and will thus be able to use its strong position in music recording to put additional pressure on online and mobile music providers in order to accept higher rates for music publishing rights. In view of this close link between the recording and publishing rights, both for the customers (the providers need licences for both rights) and the music companies (possibility of joint management within the same music company), the following analysis will also take into account Universal's control of recorded music rights.
256. The complementary character of music publishing and recording is also reflected in the way Vivendi presents the benefits of the BMG Music Publishing acquisition to financial analysts: Vivendi states that the announced acquisition of BMG Music Publishing will increase Vivendi's profit in the first year as it improves "UMG's ability to capitalize on a music market that is improving supported by technological innovations and digital sales".¹⁰⁷ The acquisition of BMG Music Publishing is presented as a unique opportunity as "BMG Music Publishing enhances the strategic position and value of UMG as the world's leading recorded music company AND music publishing company" (emphasis by Vivendi).

b. Licensing of the entire repertoire and not of individual titles

257. The offer of online and mobile platforms is permanently changing and they thus need to be able to put new songs quickly on their platforms. It would be extremely inefficient, time-consuming and very costly to open negotiations for each title. Therefore, online and mobile music providers regularly conclude general licence agreements with the right owners or their agents. These licence agreements are often concluded for one year and usually cover the entire repertoire owned or administered by the respective right owner or his or her agent. They can therefore be considered as 'blanket' licences for the full repertoire of the respective right owner.
258. To date, general or blanket licences have been the licensing model for both recording rights and publishing rights for online and mobile applications. For the recording rights, each record company has granted licences for its full repertoire whereas for publishing rights the collecting societies have granted blanket licences comprising all the repertoires which they administered.
259. As explained above, the rights of the performing artists (recording or neighbouring rights) are normally assigned to the record companies. Generally, the record companies have, in addition to the performing artists' rights, neighbouring rights of their own in the recordings. In any event, due to the assignment of the performing artists' rights, all

¹⁰⁷ Jacques Espinasse on Morgan Stanley Conference, Barcelona, 17.11.2006, p.7 and 8: http://www.vivendi.com/ir/download/pdf/MS_TMT_171106.pdf

recording rights are in the hands of the record companies each of which is therefore able to grant blanket licences for its full repertoire of recording rights.¹⁰⁸

260. Publishing rights were, prior to the recently initiated re-organisation of publishing rights for digital applications, licensed by the collecting societies to the online and mobile music providers. As explained above, the collecting societies regularly granted, for "their" territory, a blanket licence which comprised the "world repertoire" of virtually all publishers to which they had access on the basis of bilateral agreements with other collecting societies around the world.
261. In the likely future scenario, as described above, following the already initiated process of re-organisation of publishing rights, online and mobile music providers will no longer be able to get a blanket licence for publishing rights for the "world repertoire" from any collecting society. Similar to the situation regarding recording rights, they will instead have to turn to each individual publisher and its "partner" collecting society which is in charge of licensing the publishing rights of that publisher and of collecting royalties on its account. The individual publisher and its respective partner collecting society will tend to grant general licences covering the complete repertoire, initially limited to the Anglo-American repertoire, of that publisher.
262. Such a publishing rights licence agreement (or framework agreement) determines the licensing terms and conditions, including the applicable tariff or tariff formula.¹⁰⁹ As the terms and conditions are thus negotiated ex ante and for the bundle of titles which form the entire repertoire of the publisher, the size and the characteristics of the repertoire are of major importance for the bargaining position of the publisher vis-à-vis the online and mobile music provider.
263. These licences will cover all full or split publishing rights held by that publisher.¹¹⁰ For the online and mobile music provider a licence is necessary, irrespective whether the relevant publisher holds the full publishing right or only a part of it together with other co-publishers. In case of co-publishing, the provider needs licences from all co-publishers. Solely published works and co-published works thus do not differ with respect to the requirement of a licence. They are also similar in so far as the same licence rate (or royalty rate) applies to all works whether they are solely published or co-published. The only difference occurs regarding the actual payments, as a co-publisher only receives the percentage of the full rate which corresponds to the percentage of his co-publishing right.

¹⁰⁸ Although in some countries "recorded music collecting societies" exist, it appears from the market investigation that online and mobile music providers regularly have direct agreements with the record companies. There is thus no compulsory licensing of recording (neighbouring) rights through these "recorded music collecting societies" as it was the case so far for publishing rights (mechanical and performance rights) through the "publishing collecting societies".

¹⁰⁹ Whilst the blanket licence agreement sets the (abstract) tariffs or tariff formula, the actual payments or accounts receivables are calculated on the basis of the actual sales or usages which are reported by the provider to the publisher.

¹¹⁰ According to the parties, both Universal and BMG hold full publishing rights for [70-80]*% of their respective titles, i.e. approximately [20-30]*% of Universal's and BMG's titles are co-published. For some of these currently co-published titles (namely those currently co-published by Universal and BMG only without any other publisher) Universal acquires full control as a consequence of the merger.

264. With respect to publishing rights which have not been administered by collecting societies, e.g. adaptation rights for ringtones in Germany and Austria, the past experience has shown that music publishers tend to maximise royalty rates. This is illustrated by the fact that in Germany the rate paid to GEMA for the mechanical and performance rights amounts to 10.45% whereas the adaptation right which is in addition claimed by the publishers amounts to 18%. Similar examples have been mentioned with respect to synchronisation rights which are directly licensed by publishers and which are needed for some online applications.

c. Size of the repertoire

265. The market investigation has shown that many online service providers, in particular music downloading services, consider a large repertoire as necessary in order to be able to operate on the market and to be accepted by the final customers. T-online – the internet subsidiary of Deutsche Telekom which provides also music downloading services in addition to fixed online services - indicates for example on its website that it gives access to more than one million songs. Other online download providers have indicated a similar number of titles available.

266. In order to achieve an offer which is accepted by the final customer, an online or mobile music provider ideally needs (blanket) licences from all recording companies and all publishers. The online service providers already have to separately purchase licences for recording rights from each of the different recording companies. After withdrawal from the existing collective rights management, the online service providers will also have to buy several licences for the individual publishers' repertoires and will combine them in order to create their own offer to the market. While the repertoires of the different publishers are therefore in this respect complementary, publishers face (in the restructured market after withdrawal) competitive pressure to the extent that the customers may do without single repertoires and can vary their different combinations of repertoires by including the catalogues of different publishers and exclude one or a few repertoires.¹¹¹

267. Some online music providers have indicated that they would ideally need to cover the world repertoire. However, according to some other providers, it may be possible to run an online or mobile music platform without the titles of some smaller record companies or some publishers, and temporarily, possibly without the repertoire of one major. While it is highly likely that each major's repertoire is already a highly important component of every online service provider's offer it is possible that the online service providers could at present do without one of the majors' repertoires.

268. The parties have provided examples according to which some online music providers offer their platform without one or more of the majors' repertoires, e.g. Apple i-tunes

¹¹¹ This can be illustrated with a hypothetical example: If an online music provider needs to have at least 50% of the total world repertoire and 20 equally large publishers offer their individual repertoires (which are similarly attractive), then this online provider can use many different combinations of complementary repertoires in order to reach the amount of titles needed. Despite the complementary nature of the product, the publishers compete against each other in order to be among the selected ones. If in this scenario one publisher gains a market share of 60%, his repertoire will be a "must-have" since no online music provider can do without this publisher's repertoire. Only the other publishers will compete in order to be chosen in addition. The largest publisher can be sure to be selected in any case.

Australia launched its platform without SonyBMG recording rights. One online music provider also reported in the market investigation that he was able to do without one major's repertoire for one full year before finally also receiving the necessary recording rights from this music company. Moreover, a few niche players may focus for example only on independent music. E-music is known for being a specialized provider of music from independent record companies (its repertoire is not limited to independent publishers). It can, however, not be assumed that this could be a business model for the main market. It has to be concluded that the online service providers need a large repertoire and that they would not be able to provide an acceptable offer to end-customers if they lack more than one of the large majors' repertoires.

d. Importance of chart hits

269. The parties also argued that the online music business was based on the so-called "long-tail" approach. According to this theory, online music platforms have a significant cost advantage for back catalogue in comparison with physical CDs as the digital availability does not generate any storage costs or occupy any shelf space. It is therefore argued that online music platforms generate important revenues through sales of back catalogue. However, the market investigation has demonstrated that, although online music providers consider a large available repertoire, including back catalogue, to be important for their attractiveness in their customers' perception, they generate by far the largest share of their revenues through chart hits (on average approximately 60-80%).¹¹² For mobile music providers, chart hits are even more important. For these reasons, and in respect of both online and mobile music applications, the following analysis of the market power of the different music companies will focus in particular on their presence in the chart titles.
270. However, the larger the relevant¹¹³ repertoire which is lacking in the offer of an online or mobile music provider, the less attractive and the less viable its platform.¹¹⁴ If one music company disposes of a sufficiently large repertoire of publishing and/or recording rights for the relevant titles, this repertoire is to be considered as *incontournable* and therefore represents a *must-have repertoire* since the necessary size and coverage of an online platform will not be achieved without the repertoire of this music company. The following analysis demonstrates that the merger clearly reduces the online providers' possibilities to circumvent Universal/BMG and that the combined repertoire of Universal and of BMG Music Publishing even constitutes such a must have repertoire which cannot be replaced by the repertoire of other music companies.

¹¹² Cf. responses to question 14 of questionnaire of 22.02.2007.

¹¹³ Relevant repertoire means in this context the repertoire which is important for the online or mobile music provider to meet the demand of its customers.

¹¹⁴ A large online music provider explained: "*The larger the repertoire an online music platform can offer its customers, the more viable the service becomes. Consumers want to access a service that has the widest possible offerings and thus acts as a "one-stop-shop", and want to access their favourite music regardless of the label that a particular artist may belong to. If a consumer cannot find his or her favourite music from a music service, it is unlikely that the consumer will return to that service*"; Response of [...] to question 17b) of the Commission's questionnaire of 22.12.2006.

(2) *Measuring the publishers' market power in repertoires*

a. Market shares (revenue based, volume based)

Market share estimates (revenue based)

271. The market shares for online rights (covering the complete repertoire including Anglo-American and Continental European repertoire) on the basis of revenues according to estimates by the parties are set out in the following table. The data provided by the collecting societies deviates to some extent from these estimations and regularly provides for combined market shares for the parties between 20% and 40%.¹¹⁵

Parties' estimates¹¹⁶ – Publishing market shares (online rights)

Online	Universal	BMG	merged	EMI	Warner	Sony/ATV	Others
	%	%	%	%	%	%	%

¹¹⁵ The collecting societies were asked to provide the distributions to publishers in 2005 and the total amounts distributed to publishers. The amounts distributed to authors directly as well as commission fees retained by the collecting societies are not included in the figures.

¹¹⁶ With respect to Austria, the parties stated that BMG does not capture separately revenues arising from licensing for digital exploitation in Austria. Such revenues may be included in the total mechanical and performance revenues reported. According to the parties estimates, BMG's 2005 market shares in Austria amounted to, respectively, [10-20]*% for mechanical rights and [0-10]*% for performance rights.

Source: Collecting Societies - * as part of the Nordic area

272. The information provided by the collecting societies differs from the estimations from the parties in Hungary and Spain where the parties' estimated market shares were much higher than those of the collecting societies' estimates. In Germany, Italy and the United Kingdom the parties' estimates are close to the market shares calculated by the collecting societies. Conversely, the parties' estimates for the other countries (Austria, Belgium, Czech Republic, Finland, Greece, the Netherlands, Sweden and Norway) are underestimated.

Market share estimates (chart based)

273. The Commission also carried out an analysis of the annual top 100 single charts for 2006¹¹⁸ - as provided by the parties - in every affected country. From this analysis market shares were derived which are based on the number of chart hits which may be used as an approximation of volume based market shares. Due to the importance of chart hits for online customers, the analysis of this part of the total repertoire indicates the effects of the merger. 77% of the online and mobile respondents indicated that chart hits are very important, representing 50-90% of their revenues.
274. The following calculations are based on the number of individual titles represented by a major within the charts. The chart data includes the ranking of the best selling titles, however it does not systematically include the number of titles sold. Since the presence of

¹¹⁷ No online data was provided by the French and the Polish collecting societies, and the Czech data is incomplete. For the Nordic countries (Sweden, Norway, Finland), the figures provided by NCB were taken. NCB administers the mechanical rights (including those for online use) for all Nordic and Baltic countries – no split according to the different countries was provided.

¹¹⁸ In countries where no top 100 annual charts are set up, the most appropriate alternative charts were taken into account (Austria: www.austriatop40.at ; Belgium: www.ultratop.be; Czech Republic: www.ifpicr.cz; Finland: www.yle.fi; France: www.disqueenfrance.com; Germany: www.media-control.de; Greece: www.ifpi.gr; Hungary: www.mahasz.hu; Italy: www.fimi.it; the Netherlands: www.magacharts.nl; Poland: www.rmfm.pl; Spain: www.promusicae.es; Sweden: www.hitlistan.se; United Kingdom: www.theofficialcharts.com; Norway: www.ifpi.no)

titles in the charts and the shares of chart-hits represented by the different publishers are analyzed, the assessment values a number 1 hit equally to a number 100.¹¹⁹

275. The charts are of particular importance for online music providers, as they notably create traffic and attract customers on their platforms. An analysis focused on the charts therefore adequately represents the specific demand of these customers. Apart from this, the chart analysis may also be a rough proxy for the overall market position of the parties in the publishing industry. This can be shown on the basis of market shares derived from chart data and which gives a similar picture as the revenue-based market shares provided by the collecting societies. The following methodology was applied: When a title is controlled by two publishers, the market share associated to this title is distributed between the publishers according to their share of the title (i.e. share of 33% is counted as 0.33; share of 100% is counted as 1). By considering any title according to the specific share held by each publisher a similar perspective is chosen as in the revenue based market share calculations by the parties and the collecting societies since revenues also arise for each publisher only according to the individual share of the right.

276. The results from this analysis on the basis of official charts are summarized in the following table:

Publishing market shares – top 100 official charts- 2006

	Universal	BMG	comb.	EMI	Warner	Sony/ATV	Others
Austria	17%	9%	25%	26%	11%	4%	34%
Belgium	14%	6%	20%	11%	12%	3%	54%
Czech R.	11%	9%	20%	13%	10%	6%	52%
Finland	5%	7%	12%	12%	7%	4%	65%
France	5%	13%	18%	11%	9%	4%	60%
Germany	15%	10%	24%	21%	14%	2%	38%
Greece	8%	6%	13%	7%	10%	3%	67%
Hungary	9%	8%	17%	19%	9%	3%	53%
Italy	13%	8%	21%	18%	15%	1%	45%
Netherlands	17%	10%	27%	14%	10%	5%	44%
Poland	14%	6%	19%	10%	6%	6%	58%
Spain	5%	8%	14%	9%	13%	1%	64%
Sweden	9%	15%	24%	16%	12%	3%	45%
United Kingdom	11%	10%	21%	26%	13%	10%	30%
Norway	13%	6%	19%	17%	14%	6%	44%
Affected markets	11%	10%	21%	19%	12%	5%	43%

¹¹⁹ Therefore, for instance in the United Kingdom charts, the title n°1 "Crazy" from "Gnarls Barkley" accounts for 820,050 sales and the title n°100 "MYMYMY" from "Armand Van Helden" accounts for 75,267 sales in 2006. Despite this large difference, both titles will be considered as accounting for 1% of the top 100 titles. This methodology might appear misleading at first sight; however, as the majors are evenly represented in the top 100 chart among top 10, top 20 or top 50, the results are very similar to those obtained when weighting each title by its sales. Weighted calculations were conducted for several of the countries where sales are available with chart ranking (France, Germany, United Kingdom). The final results are generally similar to those obtained without weighting each title by its sales.

277. For the largest markets (United Kingdom, Germany, Italy, Spain, Sweden, and the Netherlands) the market shares of Universal + BMG calculated on this basis are close to those provided by the collecting societies for 2005. The results for the smaller countries (Austria, Belgium, Czech Republic, Finland, Greece, Hungary and Norway) deviate more significantly and market shares provided by the collecting societies are higher than those calculated from the official charts. Nevertheless, although deviations in specific countries cannot be excluded, the chart perspective may be used as a rough proxy for the parties' overall position in the market.¹²⁰
278. The position from EMI in the chart is slightly stronger than its position in terms of total digital revenue as calculated by the collecting societies. This might reflect the success of EMI in developing new successful authors. Warner Chappell and Sony/ATV are similarly strong in the charts and with regard to digital revenue distributed by collecting societies. The position of the independents is also similar in the charts and when considering total digital revenues distributed by collecting societies. It can therefore be assumed that the chart analysis is also relevant for the analysis of the complete catalogue (notably back catalogue), considering that the relative market position of the different publishers is globally reflected in the market shares as calculated for the official charts only.

Inadequacy of market shares to measure market power

279. The market investigation has shown that market shares on the basis of revenues alone might not fully reflect the market positions of the different publishers since they do not adequately take into account their power on the basis of **co-publishing** and **recording rights**.
280. In many cases, several authors under contract with different publishers write a song together which leads to split copyrights (co-publishing). Each author owns a share of the song and each publisher administers the shares of the author under contract. The parties have submitted that approximately [20-30]*% of their catalogue is composed of co-published works. This proportion is even higher for some independents and major publishers. In order to offer the song, an online music provider needs to have a licence for all shares of publishing rights held by the different authors or their publishers in a specific title so that each publisher can veto the use of the right. For instance the title "Crazy" from "Gnarls Barkley", which ranks n°1 in the United Kingdom 2006 charts, is co-published by BMG, Warner and one independent.
281. To date, the collecting societies have organized the combination of the co-published rights by granting blanket licences for the complete world repertoire which then automatically covered all split rights. In the near future music online providers will have to secure those rights directly from the different publishers or their representatives.

¹²⁰ A similar result can be derived from a chart analysis conducted by the parties on the basis of official charts for 2005. The combined market share of the parties resulting from the chart analysis and based on the methodology indicated above would be 24% for all affected countries together. The EEA-wide market share as estimated by the parties on the basis of revenues is 26% for 2005. The overall market position as it is reflected in the conventional revenue based market shares therefore seems to be adequately reflected by the chart analysis on the basis of weighted co-publishing shares.

282. Some market participants further indicated in their responses that the parties' market power is based on both recording and publishing rights. Recording rights have always been managed by the recording branches of the majors individually. After the withdrawal from the traditional collecting societies system, all vertically integrated music companies will in the future be able to negotiate the access to the combined package of recording rights and publishing rights including fully and partly owned rights.
283. In order to offer a title, an online music provider must acquire licences for all co-publishing rights and recording rights controlling this title. If one part of all these rights is not covered, the online provider cannot offer this title to its customers. As a consequence, also shares of publishing rights and recording rights alone may confer market power which consequently has to be estimated by fully taking into account titles co-published or recorded by the parties, in addition to titles 100% published. The following chart analysis reflects these considerations under the concept of "control shares".

b. Control shares (chart based)

General principle of the analysis

284. In order to assess the market power derived from co-publishing and control of recording rights, the annual top 100 single charts for 2006 were analysed. The conventional market share analysis was subsequently extended in order to take into account the specificities of the market: An online music provider which fails to reach a licensing agreement with a particular publisher does not only lose access to the titles for which the publisher has the full publishing rights but also to those for which only parts of them are owned. The access to the specific publisher's partly owned songs is lost not only partly but completely since it is not possible to use a split right independently.

Split rights counted as full control

285. In order to reflect this specific market situation, a further analysis was conducted by counting each split right as a full work. The resulting shares (hereinafter "control shares") therefore do not represent market shares – they add up to more than 100% due to the overlap between the co-publishers. For instance, in the United Kingdom chart, the n°1 hit "Crazy" by "Gnarls Barkley" is co-published between BMG (30%), Warner (35%) and an independent publishing company (35%). BMG, as well as Warner and the independent publisher, are considered to control this title. This does not mean that BMG alone could license this work. It means that any online service who wants to use this song needs a licence from all three co-publishers and loses the complete song if he fails to achieve a licence from any one of the three co-publishers.

Methodology

286. Moreover, the following methodological position was taken:
- There are some titles which are already currently co-published by Universal and BMG. Therefore, for all BMG songs in which Universal already owns a co-publishing right, the BMG publishing right was not counted. For instance in the United Kingdom, the title "Smack that" from "Akin ft. Eminem" is co-published by Universal and BMG. To calculate the number of titles controlled by the merged entity Universal/BMG, this title was counted only once. The control share of Universal/BMG is therefore lower than the arithmetic addition of Universal and BMG control shares.

- Only publishing rights in Anglo-American titles were counted, since a withdrawal from the existing collective rights management system in the near future is more certain for this part of the repertoire than for the rest of the repertoire. For instance, in Germany, Universal Music Publishing owns publishing rights of 23 of the top 100 online titles. Among these titles, 2 belong to Continental European repertoire. Thus it was considered that in the short term Universal Music Publishing will only be able to influence the commercialization of 21 top 100 online titles in Germany.
- According to the data presented by the parties, many chart titles can belong to both Continental European and Anglo-American repertoires. This is possible when a title is co-published with one share controlled by a Continental European publisher and the other by a publisher in the United Kingdom. Controlling a share of a work due to its full or split publishing rights in Anglo-American titles is sufficient to block licensing. Therefore, when the co-published share of a publisher lies in the Anglo/American repertoire, it has been considered in this Decision that this publisher can influence the commercialisation of the relevant title. The control share was always only allocated to the co-publisher owning the Anglo-American part of the right¹²¹.
- Annual charts are available in most countries. However in several ones¹²², only weekly charts are available. For these countries, the charts of 13 different weeks, evenly distributed over the year, have been aggregated.
- The analysis was conducted in detail for the year 2006 and was cross-checked against the year 2005. The results of the year 2005 were broadly comparable with the year 2006.

287. Nevertheless, the chart analysis of one or two years can only be a kind of "snapshot" to reflect the position of a music company in the recent past and proxy for its market position. As the control shares regularly alter from year to year and depend on the success and the combination of different authors and performing artists, these control shares can only constitute indications for the market power of a music company.

288. The analysis was conducted for official charts which exist in all affected countries. In some countries also specific online charts exist. Where such online charts existed, an analysis showed that the parties' control shares were slightly higher according to online charts as compared to the official charts (with the exception of Norway).

¹²¹ "Hung up" from "Madonna" ranked n° 50 in the French charts in 2006. This title is co-published by Universal and Warner. The share of publishing controlled by Universal is part of the European continental repertoire, whereas the share controlled by Warner is part of the Anglo/American repertoire. Following the methodology described above, it is considered that this title is controlled by Warner, but it is not controlled by Universal.

"Talk" from "Coldplay", ranked n° 24 in the Dutch charts 2006. This title is co-published by BMG, Warner, Sony/ATV and independent(s). The share of publishing controlled by BMG is part of the Anglo/American repertoire, whereas the shares controlled by all the other publishers are part of the European continental repertoire. Following the methodology described above, it is considered that this title is controlled by BMG, but it is not controlled by the other publishers.

¹²² Official charts 2006: Czech Republic, Spain, Finland, Greece, Norway, Poland.

289. In the following, the official charts are used since they constitute the most representative data and therefore the most reliable basis for an analysis. Online charts are still nascent and cover in most countries exclusively or mainly online downloads. Still in 2005, the online charts only covered a very limited number of titles. While in 2006 a larger coverage was reached, it remains uncertain whether these charts are sufficiently representative. It is worth noting that for the time being, the online downloading of music is mainly done by a relatively small group of persons which could exhibit a specific taste of music since they for example might represent a similar age. The retail online music market is, however, strongly developing and is expected to grow significantly in the near future. It is likely that the participation of a larger public in this market will lead to the online charts becoming closer to the official charts which cover a much larger customer base.
290. In addition, the online rights market does not only consist of online music services offering titles for downloading. There are also other online music applications such as audio and video streaming which have not been covered by online charts. Moreover, mobile music applications which account for approximately [...] *% of Universal's digital (combined online and mobile) music revenues are not covered by online charts. Therefore, online charts do not appear to better reflect the market conditions for the overall online market as defined above, i.e. including all online and mobile applications. In addition, it appears that mobile music applications, e.g. mastertones, are strongly driven by traditional chart hits. Customers to a large extent wish to have the current chart hits as mastertones on their mobile phones. For mastertone providers and other mobile music providers, as for online music providers other than download services, therefore the official charts reflect their demand more closely than the online charts.
291. In order to avoid the described uncertainties of the digital charts, in the following the official charts will be used for the analysis.

Control shares (chart based) for publishing rights in Anglo-American titles

292. The analysis of publishing rights based on this methodology shows that of all chart hits (including Continental European and Anglo-American titles), Universal and BMG will control on average 27 titles out of 100 due to their full or split publishing rights in Anglo-American titles (i.e. without taking into account their control of Continental European repertoire), whereas they respectively controlled 15% and 13% pre-merger¹²³:

¹²³ The same analysis conducted on the base of the 2005 official charts leads to close results. Universal controls (either as sole or co-publisher) pre-merger 21 titles out of 100, BMG controls 15 titles out of 100, and Universal/BMG would control 32 titles out of 100 at the EEA level. It can be noted that the overlap between Universal and BMG is greater in 2005, with 4 of the BMG titles co-published by Universal and BMG, whereas only one of the BMG title is co-published with Universal in 2006.

Control shares – only publishing rights

Percentage of titles controlled (100% published and co-published) by publishers due to their full or split publishing rights in Anglo-American titles – 2006

	Universal	BMG	comb.	EMI	Warner	Sony/ATV	Others
Austria	18%	8%	25%	30%	12%	7%	27%
Belgium	17%	12%	27%	20%	13%	6%	42%
Czech R.	13%	17%	29%	21%	13%	6%	29%
Finland	5%	6%	11%	13%	7%	4%	18%
France	4%	10%	14%	13%	9%	6%	16%
Germany	18%	11%	28%	29%	13%	8%	29%
Greece	12%	7%	18%	9%	9%	5%	21%
Hungary	19%	13%	29%	20%	12%	8%	24%
Italy	16%	12%	26%	24%	22%	2%	30%
Netherlands	19%	15%	33%	19%	11%	9%	27%
Poland	14%	8%	22%	16%	9%	11%	31%
Spain	5%	9%	13%	6%	14%	0%	31%
Sweden	9%	9%	17%	17%	10%	5%	25%
United Kingdom	20%	19%	38%	44%	22%	16%	48%
Norway	20%	9%	28%	23%	16%	9%	21%
Affected markets¹²⁴	15%	13%	27%	28%	16%	9%	33%

Source: official charts 2006 – Commission analysis

293. In Finland, Universal/BMG will control only 11% of the titles, whereas in the United Kingdom, it will control as high as 38% of the titles on the basis of their publishing rights. EMI will control on average 28% of chart titles across the affected markets, which is comparable to the merged entity. Conversely, Warner Chappell and Sony/ATV will be far behind with respectively 16% and 9%.
294. For the sake of clarity, when it is assumed that Universal/BMG controls 14% of the titles in France, this means that out of 100 chart titles in this country Universal/BMG has a publishing share (co-published or total publishing control) in 14 titles which all belong to the Anglo/American repertoire. Nevertheless, within the 100 chart titles, Continental-European repertoire is still present. For instance in France "Le diner" from "Benabar" ranks 19th and is co-published by Universal. It is however not counted in the 14 titles controlled by Universal/BMG as it belongs to the Continental-European repertoire.

Control shares (chart based) for publishing and recording rights in Anglo-American titles

295. Some market participants further indicated in their responses that the parties' market power is based on both recording and publishing rights. Generally a title is recorded by a single record company. Record joint ventures are rare as opposed to the situation prevailing in the publishing area where co-publishing is frequent. Therefore with regard to recording rights, a market share of 10% will correspond to the controlling of 10 titles out of 100.

¹²⁴ The figures show an average weighted on the basis of record sales. See precedent notes.

296. The recording rights analysis includes titles from both Continental European and Anglo-American repertoires as there is no need for such distinction in the recorded music industry. Indeed a record company directly controls the commercialization of all its titles, whatever the repertoire they belong to. For the merged entity's control share, only Universal's recorded titles were counted since BMG's recording business (SonyBMG) is not part of the merger. With respect to publishing, both Universal's and BMG's Anglo-American titles were counted in order to derive the control share of the merged entity.

Recording market shares

297. Based on the top 100 official charts, the recording market shares are the following:

Record industry market shares, based on top 100 official charts 2006

	Universal	BMG	comb.	EMI	Warner	SonyBMG	Others
Austria	42%		42%	11%	14%	26%	7%
Belgium	29%		29%	29%	9%	14%	19%
Czech R.	42%		42%	19%	17%	18%	5%
Finland	22%		22%	13%	15%	15%	34%
France	29%		29%	10%	18%	34%	9%

Chart-analysis: Publishing and recording rights

298. After the re-structuring of the online rights market all vertically integrated music companies will in the future be able to negotiate the access to the combined package of recording rights and publishing rights including fully and partly owned publishing rights for online applications. The reason for this is that both categories of rights are held and controlled by the same undertaking and the customers are also the same. An online music provider will therefore have to negotiate with a music company whose market power will derive from the titles it controls either by recording rights or by publishing rights.
299. The titles with one or several of the following characteristics are considered to be directly controlled by the music companies, since they can, or in the near future will be able to, influence the commercialization conditions of these titles:

¹²⁵ The figures show an average weighted on the basis of record sales. See precedent notes.

- a. Recording rights are controlled by the record sister company (i.e. Universal Music Group), including Continental European and Anglo-American repertoires.
 - b. Publishing rights are 100% controlled by the publishing sister company (i.e. Universal Music Publishing or BMG Music Publishing) for Anglo-American repertoire only.
 - c. Publishing rights are partly controlled by the publishing sister company (i.e. Universal Music Publishing or BMG Music Publishing) for Anglo-American repertoire only.
300. The titles with the following characteristics are considered not to be directly controlled by the music companies, considering that they are unlikely able to influence the commercialization conditions of these titles in the future:
- a. Anglo-American repertoire: Recording rights are not controlled by the record sister company (i.e. Universal Music Group), and the sister publishing company does not have publishing rights (100% control or co-published).
 - b. Continental-European repertoire: Recording rights are not controlled by the record sister company (i.e. Universal Music Group), whatever the share of publishing rights controlled by the publishing sister company (i.e. Universal Music Publishing). For instance, "Le diner" in France is recorded by Sony BMG and partly published by Universal, however as this title belongs to the continental repertoire, it is not counted as controlled by Universal. It is nevertheless still part of the top 100 in France.
301. The following table indicates how many titles out of the top 100 official charts the major companies control:

Control shares – publishing and recording rights

Percentage of titles controlled by majors due to either control over recording rights or control over publishing rights (100% controlled or co-published) in Anglo-American titles – 2006

	Universal	BMG increment	comb.	EMI	Warner	Sony BMG ⁽¹⁾	Others
Austria	50%	6%	56%	41%	22%	26%	33%
Belgium	36%	7%	43%	47%	18%	14%	57%
Czech R.	43%	10%	52%	38%	21%	18%	33%
Finland	26%	4%	30%	25%	19%	15%	47%
France	31%	9%	40%	23%	24%	34%	25%
Germany	47%	7%	54%	35%	22%	33%	36%
Greece	38%	6%	44%	35%	16%	19%	35%
Hungary	41%	7%	48%	35%	14%	21%	48%
Italy	28%	10%	38%	42%	28%	22%	46%
Netherlands	36%	10%	46%	32%	18%	16%	55%
Poland	47%	4%	51%	29%	15%	25%	37%
Spain	11%	8%	19%	27%	22%	27%	54%
Sweden	27%	6%	33%	23%	23%	27%	47%
United Kingdom	51%	10%	61%	49%	30%	24%	52%
Norway	40%	6%	46%	30%	24%	31%	34%
Affected markets¹²⁶	40-41%	8-9%	49-50%	37%	24-25%	27-28%	42-43%

Source: official charts 2006 – Commission analysis – ⁽¹⁾ Sony BMG data does not include overlap with Sony/ATV

302. On average, before the merger Universal can negotiate access to 40-41% of the official chart hits. Together with BMG's catalogue this share will increase to up to 49-50%¹²⁷. Universal/BMG will control as high as 61% of chart titles in the United Kingdom, whereas this figure is 19% in Spain¹²⁸.
303. Pre-merger, Universal is already ahead of the other majors, controlling 4% more titles than EMI notably. Post merger, the advantage over the other majors is significantly increased. Universal/BMG will control almost twice as many titles as Sony BMG (not including Sony/ATV)¹²⁹ and Warner and 1.3 times as many titles as EMI. The merger would allow Universal to become the only major controlling half of the catalogue.
304. The parties submitted that a part of the titles distributed by Universal Music Group (record) are distributed within distribution or licensing deals on behalf of the record

¹²⁶ The figures show an average weighted on the basis of record sales. See precedent notes.

¹²⁷ The same analysis was conducted based on the official charts 2005. According to this set of data, Universal can before the merger negotiate access to 45% of the official chart hits. Together with BMG's catalogue this share will increase to up to 52%.

¹²⁸ When analysing the official charts 2005, it appears that Universal/BMG would control as high as 60% of chart titles in the United Kingdom and as low as 30% in Sweden. It would control 38% of Spanish charts.

¹²⁹ SonyBMG is a Joint Venture grouping the recording activities of Sony and Bertelsmann companies. Sony/ATV is a Joint Venture between Sony and the artists Michael Jackson and active in the music publishing sector.

company which originally recorded the title. However, these deals account for a limited share of the titles recorded by Universal. In addition, the majority of these deals are licensing deals where the licensee (Universal Music Group) has a certain degree of commercial freedom to promote, distribute and market a title. Therefore the Commission considers that these titles should be considered as the other Universal titles in terms of control.

c. Analysis of affected markets

305. A number of the affected countries in the EEA are significantly impacted by the merger. In assessing the control shares set out above, it has to be taken into consideration that these shares are not equivalent to traditional market shares. Genuinely, control shares are higher than market shares and add up to more than 100% due to the consideration of co-publishing and recording. Any company with a high control share will be difficult to circumvent for the demand side. This is all the more the case where a company reaches 50% since only half or less of the repertoire remains available as substitute. In a cautious approach, the Commission therefore considers that the merger would have a significant impact in those markets where the merged entity would reach or exceed a control share of 50%.
306. Universal/BMG will control 50% or more of the titles in the top 100 charts in 5 countries and on EEA-level.

Austria

307. Universal controls 50 titles out of 100. Together with BMG, they will control 56 titles out of 100. This 6% increment is among the smallest if compared to the average increment calculated for the affected markets.
308. EMI is relatively strong in Austria, controlling 41 titles out of 100 in the official charts. Warner, SonyBMG and Sony/ATV are significantly smaller, controlling respectively 22%, 26% and 7% of the official chart hits. All these music companies are already smaller than Universal and would be far behind Universal/BMG.
309. On the basis of this entrenched market position it is likely that Universal/BMG will be able to increase prices for its repertoire after the merger. Any circumvention of Universal/BMG by an online user will become even more difficult after the merger since only 44% of the top titles remain free of any Universal/BMG interest.
310. As described above, the specific regulation which exists in Austria on the basis of the law on collecting societies¹³⁰ is not likely to prevent such a price increase. The arbitration mechanism only exists on the basis of the national activity of the collecting societies AKM and Austro Mechana but does not define an extended scope for multi-territorial licensing and licensing in Austria by foreign collecting societies. In Austria only one collecting society may obtain an operating licence per category of right. Foreign collecting societies could therefore not have the status of a collecting society but only that of an agent not bound to the specific collecting society's rules.

¹³⁰ Verwertungsgesellschaftengesetz

311. The merger therefore significantly impacts the Austrian market for online rights.

Belgium

312. Universal controls 36 titles out of 100. Together with BMG, they will control 43 titles out of 100.

313. EMI is already strong in Belgium, controlling 47 titles out of 100 in the official charts remaining larger than Universal, even after the merger. Warner, SonyBMG and Sony/ATV are significantly smaller, controlling respectively 18%, 14% and 6% of the chart hits. They are already smaller than Universal and would be far behind Universal/BMG.

314. In Belgium, the merger would increase Universal/BMG's control share to 43%. Universal's repertoire would therefore still be substitutable for a user by combining most of the other publishers' repertoires since 57% of all chart hits would still be free of any Universal interest. It is therefore unlikely that the merger creates competition concerns with respect to the Belgian market. The merger therefore does not lead to a significant impediment of competition in the Belgian market for online rights.

Czech Republic

315. According to official charts Universal controls 43 titles out of 100. Together with BMG, they will control 52 titles out of 100. This 9% increment is equal to the average increment calculated for the affected markets.

316. EMI controls 38 titles out of 100 in the official charts. Pre-merger EMI was comparable to Universal, whereas after the merger it will become significantly smaller than Universal/BMG. Warner, SonyBMG and Sony/ATV are significantly smaller, controlling respectively 21%, 18% and 6% of the official chart hits. All these music companies are already smaller than Universal and would be far behind Universal/BMG.

317. After the merger, Universal/BMG will have a controlling stake in more than half of the chart hits in the Czech Republic. No online service provider will be able any longer to substitute Universal/BMG by combining all other repertoires. While the tariffs of the Czech collecting society OSA may be reviewed upon appeal by the Ministry of Culture, there appear to be no legal provisions which would provide for explicit rules for EEA-wide licences which may in addition be granted by a foreign collecting society. It is unlikely that a price increase by Universal in the Czech Republic could be effectively prevented by the existing national regulation. If at all, this would be conceivable if Universal/BMG chose OSA as service provider which, on the basis of the current information, is not intended.

318. In the Czech Republic, the merger would increase Universal/BMG's control share above the 50% threshold which means that it is not possible anymore to replace Universal/BMG's repertoire even by the combination of all other repertoires since the repertoire without any Universal interests is smaller than the one in which Universal/BMG has a controlling stake in one form or the other. It is therefore likely that Universal/BMG will be able to increase prices after the merger in the Czech Republic. The merger therefore significantly impacts the market for online rights in the Czech Republic.

Finland

319. According to official charts Universal controls 26 titles out of 100. Together with BMG, they will control 30 titles out of 100. This 4% increment is the smallest in all affected countries if compared with the average increment calculated for the affected markets where official charts are available. Finland is the least affected market.
320. All the major music companies are relatively weak in Finland. EMI controls 25 titles out of 100 in the official charts and is comparable to Universal. Warner, SonyBMG and Sony/ATV are smaller. They control respectively 19%, 15% and 4% of the official chart hits.
321. On the basis of the comparably low control shares it seems that online music providers would, even after the merger, still be able to do without Universal/BMG in case Universal/BMG required excessive prices since more than 70% of the totality of chart hits are without any Universal/BMG interest and therefore available as alternative. It is likely that sufficient leeway would remain for the online music providers and competitive pressure on Universal/BMG would consequently not decrease due to the merger. In Finland, it can therefore not be concluded that the merger would create competition concerns on a purely national basis. The merger therefore does not lead to a significant impediment of effective competition on the market for online rights in Finland.

France

322. Universal controls 31 titles out of 100. Together with BMG, they will control 40 titles out of 100. This 9% increment is slightly more than the average increment calculated for the affected markets. EMI is relatively weak in France, controlling 23 titles out of 100 in the charts. Pre-merger EMI was already smaller than Universal – after the merger, it becomes significantly smaller than Universal/BMG. Universal/BMG will control almost twice as many titles as EMI in the charts (x 1.7). Warner, SonyBMG and Sony/ATV are significantly smaller, controlling respectively 24%, 34% and 6% of the official chart hits. They are already smaller than Universal and would be far behind Universal/BMG.
323. Universal will after the merger control 40% of the chart hits. Universal's repertoire would therefore still be substitutable for a user by combining most of the other publishers' repertoires since 60% of all chart hits would still be free of any Universal interest. It is therefore unlikely that the merger creates competition concerns with respect to the French market. The merger therefore does not lead to a significant impediment of effective competition on the market for online rights in France.

Germany

324. According to official charts Universal controls 47 titles out of 100. Together with BMG, they will control 54 titles out of 100.
325. EMI controls 35 titles out of 100 in the official charts. Pre-merger EMI was already smaller than Universal, it becomes significantly smaller than Universal/BMG. Universal/BMG will control 1.5 times as many titles as EMI in the official charts. Warner, SonyBMG and Sony/ATV are smaller, controlling respectively 22%, 33% and 8% of the chart hits. They are already smaller than Universal and would be far behind Universal/BMG.

326. In Germany, Universal/BMG will therefore significantly increase its control share and thereby its market power due to the merger. A specific arbitration mechanism exists in Germany where users can appeal against tariffs set by GEMA to the Arbitral Tribunal at the Patent Office. However, according to the parties' information a body applying for a status of a collecting society must be located in Germany. It is therefore - as in the other countries – probable that any foreign collecting society would rather act as agent of the respective publisher and would not fall under the national rules for collecting societies. The German collecting society GEMA indicates that it would likely depend on the agreement between the publisher and the selected collecting society whether the regulation applies or not. This clearly shows that any such regulation does not apply per se.¹³¹ Against this background it is likely that Universal/BMG will after the merger have the possibility to increase prices.
327. In Germany, the merger would increase Universal/BMG's control share above the 50% threshold which means that it is not possible anymore to replace Universal/BMG's repertoire even by the combination of all other repertoires since the repertoire without any Universal interests is smaller than the one in which Universal/BMG has a controlling stake in one form or the other. It is therefore likely that Universal/BMG will be able to increase prices after the merger in Germany. The merger therefore significantly impacts the online rights market in Germany.

Greece

328. According to official charts Universal controls 38 titles out of 100. Together with BMG, they will control 44 titles out of 100. This 6% increment is among the smallest in all affected countries if compared with the average increment calculated for the affected markets where official charts are available.
329. EMI is comparable to Universal/BMG. It controls 35 titles out of 100 in the official charts. Warner, SonyBMG and Sony/ATV are significantly smaller and control respectively 16%, 19% and 5% of the official chart hits.
330. In Greece, Universal will control 44% of the chart hits in Greece after the merger. Universal's repertoire would therefore still be substitutable for a user by combining most of the other publishers' repertoires since 56% of all chart hits would still be free of any Universal interest. It is therefore unlikely that the merger creates competition concerns with respect to the Greek market. The merger therefore does not lead to a significant impediment of effective competition on the market for online rights in Greece.

Hungary

331. According to official charts Universal controls 41 titles out of 100. Together with BMG, they will control 48 titles out of 100. This 7% increment is below average if compared to the average increment (9%) calculated for the affected markets where official charts are available.
332. EMI controls 35 titles out of 100 in the official charts. Pre-merger, it was smaller to Universal, it will become significantly smaller than Universal/BMG. Warner, SonyBMG

¹³¹ See GEMA's reply to Questionnaire to collecting societies 3, dated 5 February 2007, question 6.

and Sony/ATV are significantly smaller and control respectively 14%, 21% and 8% of the official chart hits.

333. In Hungary, Universal will therefore control 48% of the chart hits after the merger. Universal's repertoire would therefore still be substitutable for a user by combining most of the other publishers' repertoires since 52% of all chart hits would still be free of any Universal interest. It is therefore unlikely that the merger raises competition concerns with respect to the Hungarian market. The merger does not therefore lead to a significant impediment of effective competition on the market for online rights in Hungary.

Italy

334. Universal controls 28 titles out of 100. Together with BMG, they will control 38 titles out of 100. EMI will continue leading before Universal - however, with a smaller distance to Universal. Warner controls 28%, SonyBMG 22% and Sony/ATV 2% of the chart hits.
335. An online music provider wanting to circumvent Universal/BMG's catalogue will still have more than 60% of the total repertoire by which it could replace Universal/BMG. It is therefore unlikely that the merger will lead to competition concerns in Italy. The merger will not lead to a significant impediment of effective competition on the market for online rights in Italy.

The Netherlands

336. According to official charts, Universal controls 36 titles out of 100. Together with BMG, they will control 46 titles out of 100.
337. EMI controls 32 titles out of 100 in the official charts. After the merger, it becomes significantly smaller than Universal/BMG. Warner, SonyBMG and Sony/ATV are significantly smaller, controlling respectively 18%, 16% and 9% of the chart hits. They are already smaller than Universal and would be far behind Universal/BMG.
338. In the Netherlands, Universal will therefore control 46% of the chart hits after the merger. Universal's repertoire would therefore still be substitutable for a user by combining most of the other publishers' repertoires since 54% of all chart hits would still be free of any Universal interest. It is therefore unlikely that the merger raises competition concerns with respect to the Dutch market. The merger therefore does not lead to a significant impediment of effective competition on the online rights market in the Netherlands.

Poland

339. According to official charts Universal controls 47 titles out of 100. Together with BMG, they will control 51 titles out of 100. This 4% increment is among the lowest in all affected countries if compared to the average increment calculated for the affected markets where official charts are available.
340. EMI is relatively weak in Poland, controlling 29 titles out of 100 in the official charts. Pre-merger, it was already significantly smaller than Universal. Warner, SonyBMG and Sony/ATV are significantly smaller and control respectively 15%, 25% and 11% of the official chart hits.

341. Universal/BMG will after the merger control half of the chart hits in Poland and will thereby become a must-have publisher. The merger would increase Universal/BMG's control share above the 50% threshold which means that it is not possible anymore to replace Universal/BMG's repertoire even by the combination of all other repertoires since the repertoire without any Universal interests is smaller than the one in which Universal/BMG has a controlling stake in one form or the other. It is therefore likely that Universal/BMG will be able to increase prices after the merger in Poland. The merger therefore significantly impacts the online rights market in Poland.

Spain

342. According to official charts, Universal controls 11 titles out of 100. Together with BMG, they will control 8 titles out of 100. EMI leads in Spain with 27% together with SonyBMG which reaches an equal value.
343. Due to the unusually weak position of the parties in Spain, it is not likely that Universal will be able to increase prices after the merger. The merger therefore does not lead to a significant impediment of effective competition on the online rights market in Spain.

Sweden

344. Universal controls 27 titles out of 100. Together with BMG, they will control 33 titles out of 100.
345. EMI, Warner and Sony BMG are comparable and control respectively 23, 23 and 27 titles out of 100 in the official charts. Pre-merger they were all comparable to Universal, they become smaller than Universal/BMG. However the gap (in terms of number of titles controlled) between Universal/BMG and these three major companies is less pronounced than in the other affected markets. Sony/ATV is significantly smaller, controlling 8% of the chart hits.
346. With a control share of 33% for Universal in Sweden, the online music providers would still have almost 70% of the market as alternative. It therefore cannot be concluded that the merger will lead to competition concerns in this market. The merger therefore does not lead to a significant impediment of effective competition on the online rights market in Sweden.

United Kingdom

347. Universal controls 51 titles out of 100. Together with BMG, they will control 61 titles out of 100. This 10% increment is slightly inferior to the average increment calculated for the affected markets. The United Kingdom is the country where Universal/BMG controls the most titles due to the low penetration of the continental repertoire.
348. EMI is particularly strong in the United Kingdom and controls 49 titles out of 100 in the official charts. Pre-merger EMI was smaller than Universal, it becomes significantly smaller than Universal/BMG, however still controlling almost half of the chart titles. Warner, SonyBMG and Sony/ATV are significantly smaller, controlling respectively 30%, 24% and 16% of the official chart hits. They are already smaller than Universal and would be far behind Universal/BMG.

349. In the United Kingdom, Universal and BMG will together reach a very strong market position in terms of control shares. Any online provider wishing to switch in case of a price increase will have only less than 40% of the remaining repertoire of chart hits available. It is evident that this is not sufficient as an effective alternative and that Universal/BMG's repertoire will become a must-have product without which it will not be feasible for an online music provider to offer an acceptable platform to end-customers. It is also not likely that regulation in the United Kingdom would be applicable to an extent which could prevent any price increase resulting from the merger. As in all other affected countries the regulation is based on national licensing by the national collecting society. It is unlikely that the rules could equally cover EEA-wide licences and activities from other collecting societies in the United Kingdom.
350. It is therefore likely that Universal/BMG will be able to increase prices after the merger in the United Kingdom. The merger consequently significantly impacts the online rights market in the United Kingdom.

Norway

351. Universal controls 40 titles out of 100. Together with BMG, they will control 46 titles out of 100. This 6% increment is among the smaller ones in all affected countries.
352. EMI and Warner are comparable and control respectively 30 and 24 titles out of 100 in the charts. Sony BMG reaches a control share of 31%. After the merger EMI and Warner will be significantly smaller than Universal/BMG. SonyBMG will control 31%. Sony/ATV is significantly smaller, controlling 9% of the chart hits.
353. In Norway, Universal will therefore control 46% of the chart hits after the merger. Universal's repertoire would therefore still be substitutable for a user by combining most of the other publishers' repertoires since 54% of all chart hits would still be free of any Universal interest. It is therefore unlikely that the merger raises competition concerns with respect to the Norwegian market. The merger does not lead to a significant impediment of effective competition on the online rights market in Norway.

EEA

354. The figures analysed for the EEA are based on an average of the figures for the affected markets. It therefore does not cover some EEA countries, such as Denmark, Slovenia or Portugal. However the analysis includes all the largest EEA markets and the calculated control shares are sufficient good proxy for the EEA averages¹³².
355. According to weighted average of the national charts, Universal controls between 40 and 41% of the top 100 titles. Together with BMG, they will control between 49 and 50% of the charts. EMI is the second most important music company in terms of control of titles in the charts, where it controls 37 titles out of 100. Pre-merger, Universal is already

¹³² A proxy to capture the potential deviation between the EEA averages calculated in this document and those that would be obtained with the data from all EEA countries is the following: According to the IFPI (2006 – Global recording industry in numbers), among the 42 largest record markets in the world 14 correspond to the EEA affected markets, and 3 correspond to EEA non-affected markets (Denmark, Ireland, Portugal). The record market value in the 3 non-affected market accounts for 4% of the record market value of the 14 affected markets.

ahead of the other majors, controlling more titles than EMI notably. The merger would allow Universal to become the only major controlling up to half of the chart hits on an EEA-wide basis.

356. It is likely that after withdrawal the market for online rights will develop towards an EEA-wide market since the licences will cover the whole territory of the EEA and online music providers will look for collecting societies offering the specific publishers' repertoires equally EEA-wide. Universal will reach a considerable market position in Europe and gather approximately half of the total relevant repertoire. Any online music provider trying to cover the whole or at least the largest part of Europe will not be able to do without Universal.
357. Universal has a considerable strength and coverage of repertoire in the largest markets in Europe, such as the United Kingdom and Germany. The margins are at the moment not considered to be large in the downstream online market. Online music services therefore need to achieve a large number of customers and downloads in order to break-even. Any online music provider offering popular music (mainstream) on a European level will have to reach the customers of these revenue-strong countries and will therefore not be able to circumvent Universal.
358. Universal's activities also cover many EEA-countries. Universal has a strong position all over Europe (with a slightly lower tendency in the Nordic countries and a significantly weaker position in Spain). In addition, wide geographic coverage which could be alternatively sought by an online music provider to reach a minimum scale will necessarily involve countries in which Universal has a strong market position or even has a must-have repertoire. After the merger, the possibilities for online music providers to do without Universal and choose a combination of repertoires offered by the other publishers instead will therefore further decrease, also at EEA-wide level. The complete combined remaining repertoire which is free of Universal interest on EEA-wide level only reaches a share of 50%.
359. The merger consequently significantly impacts the online rights market on an EEA-level.

d. Conclusion

360. After the merger, the possibilities for an online music provider to substitute Universal's repertoire by one or a few others clearly decrease. This would be the case in Austria, the Czech Republic, Germany, Poland, and the United Kingdom as well as on EEA-wide level. In fact, an online music provider would have to replace on average 49-50% of the official chart hits, and up to 61% in the United Kingdom. Only the remaining 50% of all titles (39% in the United Kingdom) would be free of any Universal interest. Customer's possibilities to provide a viable online music platform without the repertoire from Universal are surely limited in some countries already before the merger. After the merger this possibility is further decreased.
361. An online/mobile music provider wishing to develop a service with a large catalogue will not be in a position to do so without an agreement with Universal. Ideally this online music provider will preferably sign an agreement with all music companies or their agents. However, a viable service can be proposed even if a reasonable portion of the world catalogue is not included. Several examples were provided by the parties where online music providers could work without one of the record majors to some extent.

Therefore, it is likely that an online or mobile platform could be temporarily operated without the part of the catalogue controlled by Warner, Sony BMG, Sony/ATV or independents. The situation of EMI is intermediate as it controls a substantial share of the charts, however significantly lower than Universal/BMG.

362. Considering that Universal/BMG agreement is necessary to operate an online platform covering a large part of the world catalogue, and that it is not necessary to reach an agreement with all the other music companies, it can be expected that Universal/BMG will be in a position to extract sustainable higher licence rates than its competitors.

2.3.4 Profitability of a price increase

363. As demonstrated above Universal will, after the proposed merger, most likely be able to impose a price increase on online and mobile music providers as the combined Universal and BMG Music Publishing repertoire represents must-have content which these providers cannot replace by the repertoire of other music companies. However, it may be argued that Universal would be deterred from raising the rates for its repertoire if a price increase entailed such a decrease of demand which would make any price increase unprofitable.
364. An increase of royalty rates may become unprofitable if (a) the price increase is likely to be passed on by providers to their customers and, as a consequence, (b) the end consumers were to reduce their demand (volume) of Universal music to such an extent that Universal would lose more than it would gain by the higher rate. By contrast, if online and mobile music providers are not able to pass on increased royalty rates, such rate increase would be profitable for Universal unless the service providers dropped Universal content. The latter reaction is, however, most unlikely as it would seriously threaten the viability of the online or mobile music platform.

Analysis for the different online and mobile music business models

365. The consequences of an increase of Universal's licence rates to online and mobile music providers depends to a large extent on the business model of the individual provider. There are three main business models: advertising-financed, subscription and pay-per-download/streaming.
366. Advertisement-financed platforms are free of charge for the user. Therefore any increase of the royalty rate by the online or mobile music provider will not be passed on to the end consumer but rather represent an increase in costs for the service provider which will ultimately be borne by this provider. It is highly unlikely that providers of advertisement-financed platforms will change their free-of-charge business model. It is also highly unlikely that they will reject Universal's price increase and do without Universal's repertoire because this would reduce their attractiveness and consequently the advertising revenues they could generate. It results from the market investigation that providers of advertisement-financed music offers depend to the same extent as other online music business models on an offer as complete as possible. Some of these providers stated that they would not be able to pass on higher royalty rates as advertising customers have a large choice of alternative online and offline advertisement carriers.

367. Subscription platforms are, theoretically, able to pass on an increase of Universal's licence rate to their end consumers. However, it is not certain that they will do so. Some of these providers pay different rates for the recording rights of the different record companies which does not prevent them from a uniform subscription price. Although many online music subscription providers have various subscription offers at different price levels, the Commission has not found any evidence for online music subscription services which put the record label with the highest royalty rates into a particular (more expensive) subscription offer. In case Universal's royalty increase is not passed on the price increase would be profitable for Universal. Again, it is highly unlikely that providers of music subscription platforms would renounce Universal's repertoire because such a step would jeopardise the attractiveness of their offer.
368. Even in case of a pass-on, i.e. an increase of the subscription rate, Universal would only bear a part of a potential loss in end consumer demand whilst it would gain the full benefits of the increased licensing rate. This is due to the fact that subscription platforms can only increase the subscription rate for access to their entire catalogue. They are not able to differentiate between the repertoires of the different music companies as users subscribe to the service in order to get access to all titles, irrespective of their provenance.
369. Therefore, if a general increase of the subscription fees led to a loss of customers who would no more be willing to pay the increased subscription fee for the music service, the provider would transfer less licence fees to all music companies as the licence fees are a function of the subscription fees. In case of a rate increase, Universal would thus retain the gain of a higher percentage share whereas it would only be partly hit by the reduced overall subscription revenues as the other music companies would bear, together, the largest part of this reduction. Universal would therefore be able to largely shift to its competitors the risk of a falling demand as a reaction of a rate increase. Therefore an increase of the licence rate vis-à-vis online or mobile music providers operating on a subscription basis would most likely be profitable.
370. Providers of online and mobile music platforms operating under a "pay-per-track" model, i.e. billing their users for each download, stream, ringtone etc., may pass on an increased royalty rate to their customers. There are currently two retail pricing models of "pay-per-track" platform operators: on the one hand those with a uniform price as practised e.g. by Apple's i-tunes: Apple has set a relatively low price level for its music sales as it focuses on the sale of music devices (i-pods) to which the downloading services are an additional "promotion". This pricing model has attracted many customers for two reasons: the price level and the simplicity of pricing; several competing providers, e.g. Virginmega or Mediamarkt have followed this pricing model. It is noteworthy that several of the providers with such a uniform price level pay different rates for the recording rights to the different record companies. On the other hand there are operators which apply a price differentiation among titles, e.g. T-Online's Musicload.
371. The first category of providers with a "uniform price" model has two options to react in case of an increase of royalty rates: either they keep their retail prices stable and bear themselves the additional costs in which case the rate increase would be profitable for Universal. In that scenario end consumers would probably also be harmed in their choice of music as some online or mobile music providers would, in view of low margins, drop out of the market. The second option would be to pass on the royalty increase and raise retail prices. However, in a uniform price model such a price increase would affect all titles across the board, irrespective of the recording or publishing company. Therefore,

Universal would share the risk of a decreased demand with all other music companies whereas it would gain the full benefits of the rate increase. As explained above, in such a scenario the price increase would most likely be profitable for Universal.

372. The second category of providers with a "differentiated prices" model has the possibility to pass on the royalty increase for Universal titles only in putting these titles into a higher price category. In that scenario, only Universal would be exposed to the reaction of end-consumers whereas the titles of other music companies would not be affected.
373. Such a "categorical" price increase for all Universal titles is not certain as end users do not purchase music of a certain label but music they like. Indeed, those online and mobile music providers applying differentiated price categories use also other criteria than their royalty costs when deciding into which price category to put a title. Although their costs on the wholesale levels are one of the elements taken into account in the determination of the retail price category, they also apply other criteria such as exclusivity, novelty, bonus editions and other features influencing the user's willingness to pay.
374. This is also evidenced by the current pricing strategy of online/mobile music providers with a differentiated pricing model: although they pay slightly different royalty rates to the four major record companies, they do not put the major with the highest royalty rates systematically into a higher price category. Therefore, it is possible that they will not behave differently with respect to the pass on of publishing royalties once those may vary among publishers.
375. In addition, the online provider would have to apply the price increase also to co-published titles, in proportion of the share of publishing rights controlled by Universal/BMG. This would, first, make the providers' pricing categories less comprehensible for the user and, second, for the titles for which it is co-publisher, Universal/BMG would share the risk of a decreased demand with all other involved music companies whereas it would gain the full benefits of the rate increase.
376. However, even where online music providers systematically increase the retail price for Universal titles in a differentiated price model, Universal does not have to fear a significant volume reduction through the reaction of end consumers. First, according to the responses of online and mobile music providers, end customers who want to buy a certain title are unlikely to switch to another title just because that one is cheaper. As music is a heterogeneous good and each user has individual preferences, each user only considers a limited number of titles as substitutable to each other. Second, as demonstrated above, many of these titles considered as potential substitutes to a given title are controlled by Universal and BMG which have (co-)control of the publishing rights for approximately 50% of all chart hits. Therefore, the number of potential alternatives for the end consumer is considerably reduced.
377. Third, the willingness to pay is also driven by other factors than price, such as being the first to have novelties¹³³ and thus being cutting-edge or subjective preferences of the individual consumer. It is true that a certain pricing constraint results, mainly for online download applications, from CDs and other physical music carriers and from illegitimate

¹³³ This is confirmed by the fact that some platforms apply higher prices to the download of new releases which they offer in exclusivity.

downloads. However, file-sharing and other non-commercial offers seem to play a rather limited role with respect to mastertones and other mobile music applications.

378. With respect to online downloads, some end consumers may indeed be expected not to buy a certain title in case of a price increase, and possibly acquire them via file-sharing. However, it is also to be expected that the number of those customers who would abstain from buying will be rather limited: first, those end consumers with a low willingness to pay are unlikely to be potential buyers even at the current price level. The volume reduction effect which is relevant for the assessment of the profitability of a royalty rate increase by Universal, will therefore be limited to those customers who are willing to buy at the current price level but would be deterred to do so in case of a small but significant increase of royalty rates. In view of the relatively small part of publishing royalties in the total price of an online or mobile application a price increase by 10% is unlikely to have a deterrent effect on the end consumer.¹³⁴ In the light of the above and taking into account the limited substitutability of songs in the end customers' view, it is thus very unlikely that an end consumer would quit buying in response to such a price increase.
379. Therefore, even in the scenario that online and mobile music providers were to pass on higher royalty rates for Universal music to Universal titles in a targeted way, the reaction of end consumers is unlikely to result in a significant reduction of the demand volume for Universal titles. An increase of royalty rates would thus be profitable for Universal vis-à-vis all kinds of online and mobile music providers.
380. Therefore, following the profitability analysis, it can be concluded that the merger raises serious doubts in the markets for online rights identified above, *i.e.* in Austria, Czech Republic, Germany, Poland and the United Kingdom as well as for the EEA.

2.3.5 Reactions of customers (online and mobile music providers)

381. The extent of the price increase by Universal/BMG will be affected by - on the one hand - the degree of complementarity of the rights in its combined repertoire and - on the other hand - by the change in the bargaining power of its competitors as well as in particular the reaction of the customers.
382. It may be argued that online and mobile music providers exert an effective constraint on Universal due to their countervailing buyer power. The parties submitted that in particular Apple would have considerable buyer power as its "i-tunes" platform is the most important online download service in many European countries. It is true that Universal has a strong interest of being present on i-tunes. On the other hand, however, Apple's business model is based on the sale of music at relatively low prices in order to attract consumers which will be obliged to buy an "i-pod", Apple's portable music device. It is noteworthy that music downloaded via i-tunes can, due to Apple's DRM, only be played on the i-pod but not on other portable devices. Consequently, Apple makes a much higher margin on the sales of i-pods than on the sale of music.
383. In order to attract as many people as possible to buy i-pods, Apple has an extremely high interest to be the most attractive and complete download platform. In view of the large

¹³⁴ Publishing royalties currently amount to 8-15% of the net retail sales price, varying among countries and applications.

Universal/BMG repertoire, Apple cannot really threaten to switch to other suppliers¹³⁵ but it is limited to the threat not to offer Universal titles on its platform. If Apple were not able to offer the content of the new entity, it would lose its current attractiveness and risk foregoing not only revenues from music sales but, more importantly, higher revenues from the sales of i-pod devices. Therefore, Apple's bargaining position vis-à-vis Universal, the by far largest catalogue after the merger, is rather limited. It is therefore concluded that even Apple would not exert effective constraints on Universal's pricing behaviour.

384. Even if it were assumed that Apple had effective countervailing buyer power, *quod non*, this would not exclude the finding of a significant impediment of effective competition. First, Apple only accounts for a limited part of Universal's online and mobile music sales. According to Universal's parent company Vivendi¹³⁶, mobile music accounted for 45% of its total global digital revenue. Among the remaining 55% of Universal's digital revenues from online sales, Apple seems to be the largest individual customer but followed by a large number of other important providers. Therefore Apple's share of the total demand is far below 40% of the overall demand.
385. In any event, even if Apple had, in spite of the above, countervailing buyer power, this could not sufficiently off-set the above-described negative effects of the proposed merger. Universal is able to price discriminate between its customers, i.e. the various online and mobile music provider, and Apple's possible, *quod non*, buyer power would thus not shield these other customers from a royalty rates increase. It is therefore concluded that Universal's increased pricing power is not constraint by countervailing buyer power.

VII. RESULTS

386. Against this background, it is very likely that Universal will post-merger, on the basis of non-coordinated effects, have the possibility and the incentive to increase prices for its repertoire of Anglo-American mechanical rights for online applications. The merger therefore raises serious doubts with respect to the online rights market both on an EEA-wide level and in the countries Austria, the Czech Republic, Germany, Poland, and the United Kingdom. By contrast, the Commission has not found any indications in the market investigation that, in a scenario following the withdrawal of online publishing rights from the existing system of collective rights management through collecting societies and the re-organisation of the administration of those rights, the merger could lead to coordinated effects in the market for online rights.

VIII. REMEDIES

387. The notifying party submitted a first set of remedies on 15 March 2007. In response to the results of the market test and the Commission's comments, these remedies have twice been substantially improved, namely on 26 March and on 30 March 2007. Subsequently,

¹³⁵ Cf. Section 65 of the Horizontal Merger Guidelines.

¹³⁶ Vivendi presentation "2006 Results and 2007 Outlook" by Jean Bernard Lévy and Jacques Espinasse on 07.03.2007.

the commitments text received some technical refinements and a final version was submitted on 23 April 2007.

1. Description of the commitments submitted by the notifying party

1.1 Description of the First Divestiture Package

388. On 15 March 2007, Universal proposed to divest a number of catalogues covering a package of Anglo-American repertoire ("the First Divestiture Package"). According to the parties, these catalogues are separate legal entities within BMG which, after their acquisition by BMG, have continued to sign authors directly. Universal submitted that the First Divestiture Package could be sold in parts or as a single package and was structured in such a way that the individual catalogues can be added to an existing music publishing business or be used to enter the market as a new music publishing company.

389. The First Divestiture Package comprised the following catalogues and contracts:

(a) BMG catalogues

- (i) Zomba Music Publishers Limited ("Zomba UK")
- (ii) Unisong Music Publishers B.V.
- (iii) 19 Music Limited
- (iv) First Avenue Music Limited
- (v) Deconstruction Songs Limited
- (vi) Minaret Music Limited
- (vii) 19 Songs Limited
- (viii) Strongsongs Limited
- (ix) Logo Songs Limited
- (x) Block and Gilbert Music Limited
- (xi) Red Star Songs Limited
- (xii) Point Music Limited
- (xiii) Mucho Loco Music Limited
- (xiv) BBC music publishing catalogue

(b) Universal catalogues

- (xv) Anxious Music Limited
- (xvi) Momentum Music Limited
- (xvii) Momentum Music 2 Limited

390. The four most important (and eventually maintained) catalogues of the First Remedies proposal are described in the following. Zomba UK's catalogue includes amongst others Bruce Springsteen, Billy Ocean, Iron Maiden and rights to music by Denniz Pop and Max Martin who were the writer/producer behind Britney Spears, The Backstreet Boys, NSYNC, Celine Dion and Westlife. Amongst the most successful hits are "Hit me baby one more time" and "Oops I did it again" by Britney Spears, Kelly Clarkson's "Behind these hazel eyes", "I want it that way" from the boy group The Backstreet boys, "Everything I do..." by Bryan Adams, Bon Jovi's "It's my life" and Celine Dion's "That's the way it is". The EEA-wide revenues of Zomba Music Publishers Limited constantly increased from EUR [5-10]* million in 2004 to EUR [5-10]* million in 2006.

391. 19 Music's catalogue includes titles of Culture Club (e.g. "Karma Chameleon"), Spice Girls (e.g. "Spiceworld and "Spice") Boyzone (e.g. "Said and Done" and "A Different Beat") and S CLUB 7 ("Don't stop moving") form part of this catalogue. 19 Music's EEA revenues amounted to EUR [0-500 000]* in 2006. 19 Songs is a joint venture in which BMG and the record and television producer Simon Fuller each hold 50% of the shares and which generated revenues of EUR [0-500 000]* in 2006. It consists of pop music linked to TV reality shows and other pop repertoire such as songs by Emma Burton. Its most popular title is the American Idol theme. The BBC catalogue contains copyrights in television themes which are broadcast in the United Kingdom and globally such as the "Teletubbies" and "Bob the Builder". It generated EEA wide revenues of EUR [0-5]* million in 2006.
392. In addition to rights in the songs of these catalogues, the First Divestiture Package also included ongoing contracts. The parties indicated that these ongoing contracts also encompass contracts with authors who are still under obligation to produce further songs for these catalogues in the future. Moreover, Zomba UK was described as a "full service publishing" company with its own creative team which would be part of the divestiture if requested by potential purchasers. Universal proposed to divest the full rights for the various catalogues but to set up a "licensing back" agreement with the acquirer under which Universal would receive the worldwide rights outside the EEA.
393. The revenues generated by the First Divestiture Package amounted to EUR [10-20]* million in the EEA with Zomba UK representing alone more than half of these revenues.¹³⁷ The parties submitted that the Divestiture Package would represent, both in the United Kingdom and in the other EEA countries, [20-30]*% of BMG's top 1 000 works and [25-35]*% of BMG's top 500 works.

1.2 Results of the market test for the First Divestiture Package

394. In the first market test approximately 100 questionnaires were sent to publishers, collecting societies and online and mobile music providers with a return of 44 responses. The market test indicated that a divestiture of catalogues is in principle an appropriate remedy to remove the competition concerns identified by the Commission. However, the market test showed that the First Divestiture Package was not sufficient to remove the competition concerns identified by the Commission.¹³⁸ A large number of respondents indicated that the suggested remedies would not reduce to an acceptable extent the increase of Universal's market power in the online rights market. Many market participants considered that the divestiture would

¹³⁷ 2005 figures as submitted by the notifying party.

¹³⁸ See responses to the Questionnaire Remedies, dated 15 March 2007, questions 14 and 15: Out of 41 substantive responses, 22 market participants answered directly to the question as to whether the remedies would remove the competition concerns. Most of the others declared not to have sufficient knowledge to make this assessment. Among the 22 respondents were

- 11 publishers; 3 of them considered the Divestiture Package as adequate to remove the Commission's concerns with 8 expressing a negative view or raising doubts.
- 6 online/mobile music providers 4 of them expressed an overall negative view, 2 considered the Divestiture Package as sufficient.
- Not many collecting societies considered themselves capable of making an assessment: 4 of the 5 respondents, however, indicated that the remedies would probably not remove the concerns – only 1 of those answering the relevant question found the Divestiture Package to be sufficient.

have to be more substantial than that proposed by the notifying party. In particular, some respondents emphasised that the First Divestiture Package lacked a strong U.S. catalogue.

395. With respect to the characteristics of an appropriate remedies package the market test provided valuable information. Many respondents considered it as essential that the catalogues are of good quality and represent a sufficient volume in number of titles and revenues. The catalogues further should be an adequate mixture of recent hits and successful back-catalogue in order to secure steady revenue stream and the continuity of the business. Moreover, the catalogues should cover Anglo-American titles and authors with a scope for the whole of the EEA and not only for one or two countries. The catalogues should also provide for a good combination of successfully established authors with the potential to supply further hits and of newly signed authors with the potential to break through and develop new business.
396. These conditions were not met by the First Divestiture Package. Many respondents indicated that the quality of most of the proposed smaller catalogues was insufficient, with only four exceptions: Zomba UK, 19 Songs, 19 Music and the BBC catalogue. All other catalogues were mostly considered as insignificant and of little value. They were described as having no chart hits and only rather old songs which were not "evergreens" and were thus unlikely to be released in cover versions in the future.
397. Moreover, the market test indicated that many of these smaller catalogues only had a limited geographical scope¹³⁹ and that their titles were largely unknown in other European countries. In addition, some catalogues of the First Divestiture Package represented niche products.¹⁴⁰ Such niche catalogues are of only minor relevance for online and mobile music providers and their divestiture would thus not address the competition concerns.
398. By contrast, according to a number of respondents, Zomba UK, the largest catalogue in the First Divestiture Package, represents an important part of BMG's Anglo-American music publishing activities and provides hits all across Europe. Many respondents also indicated that Zomba UK probably had a number of good authors under contract. It was also mentioned that the 19 Songs and/or 19 Music catalogues are attractive, have a larger than national scope and constitute a relatively good combination of hits, back catalogue and authors. As to the BBC catalogue, it was described as attractive but not very chart relevant.
399. In spite of certain positive elements in some catalogues the First Divestiture Package was thus considered by the majority of the respondents as insufficient in view of the overall increment of Universal's position through the acquisition of BMG.

1.3 Description of the Second Divestiture Package

400. On 26 March 2007, Universal modified its initial proposal in order to respond to the feed-back of the market test and the Commission's subsisting concerns. The Second Divestiture Package comprised the following catalogues:

¹³⁹ Unisong's catalogue is mainly known in the Benelux area whereas most of the other catalogues concentrate on the United Kingdom.

¹⁴⁰ For instance, Unisong was described as specialised in Gospel and Dutch songs, Logo Songs as focusing on electric folk and Red Star Songs as consisting mainly of heavy metal.

(a) BMG catalogues:

- (i) Zomba Music Publishers Limited ("Zomba UK")
- (ii) 19 Music Limited
- (iii) 19 Songs Limited
- (iv) BBC music publishing catalogue

(b) Universal catalogue:

- (v) Rondor Music (London) Limited ("Rondor UK")

401. The Second Divestiture Package thus added Rondor UK, whereas the previously proposed catalogues Unisong Music Publishers B.V., First Avenue Music Limited, Deconstruction Songs Limited, Minaret Music Limited, Strongsongs Limited, Logo Songs Limited, Block and Gilbert Music Limited, Red Star Songs Limited, Point Music Limited, Mucho Loco Music Limited, Anxious Music Limited, Momentum Music Limited and Momentum Music 2 Limited ("initially proposed smaller catalogues") were withdrawn.
402. Rondor UK's revenues in the EEA increased from EUR [5-10]* million in 2004 to EUR [5-10]* million in 2006. The catalogue includes the British band Kaiser Chiefs, winner of three Brit Awards in 2006. Their first album reached number 2 in the United Kingdom with 4 hit singles in the United Kingdom Top 20 charts after its release in 2005, including "I predict a riot" by Kaiser Chiefs which generated revenues of EUR [...] in 2006. The second album was released in March 2007 and has reached number 1 in the United Kingdom, the Netherlands and Greece, and ranking high in other national charts, too. One song of this album became number 1 in the United Kingdom and the European single charts ("Ruby").
403. The catalogue further includes artists such as Sophie Ellis Bextor and the Danish pop production team Jorgen/Larsson. Amongst its top authors is the songwriter and Dire Straits' lead singer Mark Knopfler whose former chart hits "Money for nothing", "Walk of Life", "Sultans of Swing" and "Private Investigation" are part of the catalogue. Other famous titles are "Lady in Red" by Chris de Burgh and "Wouldn't it be good" by Nick Kershaw. The divestiture of Rondor UK does not include the works of Supertramp, Squeeze and Yes. [...]*
404. As for the First Divestiture Package, Universal proposed to divest the full rights for the various catalogues but to set up a "licensing back" agreement with the acquirer under which Universal would receive the worldwide rights outside the EEA
405. The combined EEA-wide revenue of the Second Divestiture Package amounted to EUR [20-30]* million, increasing by EUR [0-10]* million in comparison with the First Remedies Package.

1.4 The results of the market test for the Second Divestiture Package

406. The second market test was sent to those 44 market participants who had answered to the first market test by that time. Approximately, half of the addressees responded within the available timeframe.
407. With respect to the qualitative criteria which were confirmed in the second market test, most of the respondents acknowledged that the additional catalogue, Rondor UK, significantly

improved the package. Most of those respondents who evaluated the quality of the catalogues confirmed that Rondor UK is of good quality, with a large number of important titles, especially in the back-catalogue. Some market participants signalled that Rondor UK contained a limited number of recent chart hits.

408. Overall, although some respondents considered the Second Divestiture Package as sufficient, a number of respondents stated that also the Second Divestiture Package was not sufficient in size to reduce the increase in Universal's market power to an acceptable extent.

1.5 Description of the Final Divestiture Package

409. On 30 March 2007, and after having been informed of the result of the second market test, the notifying party submitted a third remedies package. This Final Remedies Package includes the Second Remedies Package and adds an EEA-wide licence of the full catalogue of Zomba U.S. This licence encompasses all those copyrights held by Zomba U.S. in respect of exploitation in the EEA, including those currently in existence and those to be delivered, under existing agreements or following the exercise of any options provided for under existing agreements.

410. The Zomba U.S. catalogue generated revenues of EUR [0-10]* million in the EEA in 2006. The catalogue contains songwriters, composers and producers with ongoing obligations such as Justin Timberlake, Linkin Park, Shania Twain, Korn, Limp Bizkit and R. Kelly and some back catalogue. Amongst the most known songs are R. Kelly's "I believe I can fly" and "Outrageous", "Señorita" by Justin Timberlake and the U.S. group Linkin Park's "Numb".

2. Assessment of the Final Divestiture Package

411. The Commission carefully analysed the Final Divestiture Package (hereinafter "the Remedies Package" or "the Commitments"). In its analysis it took particular account of the results of the two market tests and of its own findings in the market investigations.

412. The Commission considered that a third market test was not necessary. The second market test confirmed the quantitative and qualitative criteria for suitable remedies as they had been described in the first market test. The Final Divestiture Package was built around the already market-tested Second Divestiture Package and addressed the shortcomings which had been pointed out in the two market tests. It added considerable revenues (almost 50% more than the Second Divestiture Package) and included an important U.S. catalogue with many chart hits and successful authors. On the basis of these improvements the Commission found that the modifications made by Universal removed the serious doubts and that it had to authorise the transaction in line with Article 10 (2) of the Merger Regulation.

413. The Commission came to this conclusion on the basis of the combined evaluation of a bundle of criteria which will be analysed in the following. These criteria are considered as the most appropriate to evaluate the future potential of the Remedies Package. The analysis therefore has not been backward looking on effects in the past but rather forward oriented in order to identify the structural growth potential of the Remedies Package.

414. The Commission considers that the Remedies Package is necessary and sufficient in terms of size, quality and composition of the catalogues, their relevance for online and mobile

music services, the number and quality of authors under contract and their potential for future success.

2.1 Characteristics of a viable remedies package

415. The market test clearly confirmed that the divestiture of entire music publishing catalogues constitutes a suitable remedy to remove the competition concerns identified by the Commission. The divestiture of catalogues has a structural effect on the market and permanently reduces the market power of Universal. By contrast, a commitment to remain in the existing collecting society system for a limited period of time, as suggested by some respondents in the market test, would counteract the general market development which is currently leading to a re-organisation of the administration of online rights, but would not permanently solve the issue of market power created by the transaction.
416. A viable remedies package should include the divestiture of the full copyright for all applications or categories, i.e. including mechanical, performance, synchronization and print rights. This is necessary to avoid a copyright split for different applications and to secure the economical efficiency of the divested catalogues. This further implies that the divestiture includes right categories (and turnover generated by the exploitation of these rights) which are not directly related to the competition concerns identified with respect to online applications.¹⁴¹
417. In order for the remedy to be swiftly and easily implemented it is important that the divestiture comprises entire catalogues which are held as separate legal entities. Whilst individual titles usually cannot be divested without the approval of the authors, catalogues in separate legal entities can be transferred pursuant to the rules applicable to the sale of companies, and thus regularly without the approval of the authors. As it is time consuming to obtain the approval of the authors concerned, the divestiture of individual titles (or the transfer of individual authors) is generally not a viable option for a merger procedure commitment which needs to be implemented quickly. All catalogues included in the Remedies Package are held in separate legal entities and their divestiture is not expected to encounter specific difficulties. The same applies to the licensing agreement for the EEA exploitation of the Zomba U.S. catalogue which will be discussed in detail below. The Remedies Package therefore fulfils the requirement of a quick and uncomplicated transferability.
418. The music publishing business is characterised by the great importance of intangible assets such as copyrights in works. Therefore, a divested catalogue can be successfully managed by an established publisher without the need to transfer any tangible assets.
419. Finally, as the competition concerns identified by the Commission only related to Anglo-American repertoire, the Remedies Package had to focus on Anglo-American catalogues.

¹⁴¹ According to Universal, music publishing revenues from online applications accounted for 2% of Universal's total music publishing revenues in 2005.

2.2 Size of the Remedies Package

420. The Remedies Package generated EEA-wide revenues of EUR [30-40]* million in 2006. The total revenues generated by all BMG's Anglo-American catalogues in 2006 amounted to EUR [80-100]* million.¹⁴² Therefore the revenues generated by the Remedies Package which consists exclusively of Anglo-American catalogues, correspond to approximately [30-35]*% of BMG's total revenues with Anglo-American titles. On the basis of a sample provided for the United Kingdom, the Remedies package would correspond to around [40-45]*% of BMG's total revenue for online exploitation.
421. The figures submitted by the parties show that two of the three main catalogues of the Remedies Package (Zomba UK and Rondor UK) generated considerably higher EEA-wide revenues in 2006 than in 2005 (6% higher for Zomba UK; and 23% higher for Rondor UK whereas the EEA revenues of Zomba U.S. decreased by 5%) which is considerably better than the average of the music publishing sector¹⁴³. It can be expected that these catalogues, including Zomba U.S. which had some very successful hits in early 2007, will continue to grow faster than the average.
422. The analysis of the relative size of the Remedies Package also has to take into account that, already pre-merger, Universal could impact on a considerable part of BMG's music publishing repertoire, whether as a co-publisher or as holder of the corresponding recording rights. In that respect, Universal submitted that [70-80]*% of the revenues generated by BMG's top 500 United Kingdom works stemmed from works which were either co-published or recorded by Universal. However, it appears that this figure overestimates the actual impact of Universal as they do not properly distinguish between "original" recordings and cover versions. The Commission therefore rather considers, on the basis of the parties' responses to various questionnaires that approximately 55-65% of BMG's publishing catalogue (both in terms of weighted revenues and number of works) is either co-published or recorded by Universal.

2.3 Universal does not retain control in most of the Remedies Package

423. The Remedies Package is composed of six catalogues which have grown over a number of years. As the different publishing catalogues have over time been co-published or recorded by various record companies, including Universal, there is no significant catalogue in which Universal would not hold any co-publishing or recording right. However, it seems that the control share of Universal in the titles of the Remedies Package is lower than in the overall BMG catalogue.¹⁴⁴

¹⁴² Parties' response to question 2 of questionnaire of 22.12.2006, as reiterated in subsequent submissions.

¹⁴³ Enders Analysis (Recorded Music and Music Publishing, page 29) forecasts an annual growth rate of 2.2% for the global music publishing industry between 2006 and 2012.

¹⁴⁴ It should be reminded that according to Universal, [70-80]*% of the revenues of BMG's catalogues were controlled by Universal either through co-publishing or through recording.

424. Of the sample of the 1 900 top works of the Remedies Package 58% are neither co-published by Universal nor have they ever been recorded by Universal.¹⁴⁵ However, in case of "multiple recording", i.e. the existence of several recordings of the same composition, Universal does not usually have the recording rights for all of them, and not for all charted recordings either. Therefore, the notifying party proposed to take account rather of those titles which have been recorded by Universal and also by other record companies. According to Universal, in 79% of the 1 900 works Universal does not have a co-publishing right nor does Universal have the only recording.
425. The Commission considers that the figure of 58% underestimates the pre-existing control of Universal because it does not take account of the actual number of songs which have been recorded by Universal. Similarly, the Commission considers that the figure of 79% overestimates the pre-existing control of Universal. Therefore the Commission considers it appropriate that approximately 65-70% (as a rough average of 58% and 79%) of the total works of the Remedies Package are not controlled by Universal.
426. More importantly, only 11% of the 1 900 top works are co-published by Universal. This means that 89% of these most successful works can be released as cover versions by other record companies without Universal being involved as co-publisher. In view of the success of these top titles it is quite likely that they will be used for cover versions by other record companies. The importance of cover versions in the music industry is illustrated by the fact that 15 of Universal's 2006 top 50 single record sales in the United Kingdom were cover versions.¹⁴⁶ In a prospective analysis, the titles which are not co-published are particularly relevant as they are those which allow for future hit recordings outside Universal's control.
427. In value terms, the titles which were neither co-published by Universal nor have ever been recorded by Universal account for [50-60]*% of the revenues generated by of the top 1 900 works the Remedies Package. Those titles in which Universal neither has a co-publishing right nor an exclusive recording (i.e. parallel recordings of other record companies exist) generated [80-90]*% of the revenues¹⁴⁷ of the top 1 900 works of the Remedies Package. In order to take due account of "multiple recordings" (see supra), it is also appropriate to consider that titles accounting for approximately [60-70]*% (as a rough average of [50-60]*% and [80-90]*%) of the total revenues of the Remedies Package are not controlled by Universal.
428. Most importantly for the future potential of the Remedies Package, 90% of the revenues were generated by titles in which Universal had no co-publishing rights. In case of successful cover versions released by other record companies, Universal would have no control at all over these titles.

¹⁴⁵ Response to question 2 of questionnaire of 03.04.2007. The Commission asked for the top 500 works of each of Zomba UK, Zomba U.S. and Rondor UK as well as the top 200 works of the BBC catalogue and the top 100 works of both 19 Songs and 19 Music.

¹⁴⁶ Seven of these 15 titles were pure cover versions and eight were samples, remixes and interpolations, i.e. other forms of using an existing title.

¹⁴⁷ The parties explained that it would be extremely difficult to calculate the allocation of the publishing revenues to the different recordings.

429. These figures demonstrate that Universal will have co-publishing rights in only a very minor part of the repertoire contained in the Remedies Package and control over only a limited part of it. Due to the composition of catalogues which have grown over time and whose works may have been recorded several times, it is impossible to find catalogues containing exclusively titles in which Universal (or any other major music company) does not have any control. However, Universal's control shares in the Remedies Package still seem to be considerably smaller than in the average of BMG's catalogues.
430. The fact that Universal will not have a co-publishing right in around 90% of the works included in the Remedies Package is relevant for the particularly important future recordings as it means that Universal will not be able to control future cover versions recorded on the basis of these rights. In this context it has to be kept in mind that the competition concerns mainly relate to music publishing rights and that the competitive assessment identified serious doubts as to a possible significant impediment of effective competition in the music publishing markets.
431. For these reasons, the Remedies Package generally addresses the competition concerns identified above, namely the control of Universal of works through co-publishing rights or/and recording rights.

2.4 Relevance of the Remedies Package for Online and Mobile Music Services

432. The Remedies Package has a significant impact on Universal's control share of those titles which are of particular importance for the success of online and mobile music platforms, namely good back catalogue and recent chart hits. Regarding successful back catalogue the qualitative analysis has shown that it is well represented in the Remedies Package and that Universal only maintains control of a minor part of it.
433. As to chart hits, 169 works of the remedies package made it into the United Kingdom weekly charts in the years 2003-2006 and they have appeared in these charts 1,540 times. This represents an average chart presence of more than 9 weeks per title. The 169 chart titles of the Remedies Package thereby account for 6.2% of all entries in the United Kingdom weekly charts over this period.¹⁴⁸ In 139 of these 169 titles Universal will not retain any co-publishing rights and they can thus be recorded as cover versions by other record companies in which case Universal does not have any control of the title.
434. Also in Member States other than the United Kingdom, the works of the Remedies Package had a high number of chart entries. For the Member States other than the United Kingdom the parties have analysed only the charts of the first week of each month for the period 2003-2006. They consider that this approach covers approximately 85% of all works charted. The parties also point out that in some Member States the weekly charts do not cover the top 100 (as in the United Kingdom) but a smaller number. On the basis of this analysis, the Remedies Package had 100 entries in the weekly charts in Germany and 66 entries in the weekly charts in Austria.
435. Also in respect of the 2006 chart hits which have been used as a proxy to evaluate the parties' position, the Remedies Package leads to a considerable reduction of the "net increment" of Universal's control of titles.

¹⁴⁸ According to the parties the total number of chart entries during this period amounted to 24,727.

436. As explained above, the chart analysis of one or two years can only be a kind of “snapshot” to reflect the position of a music company in the recent past. However, as the control shares regularly alter from year to year and depend on the success and the combination of different authors and performing artists, these control shares can only constitute indications for the market power of a music company.

437. For this reason, it is not necessary that the Remedies Package completely removes the “net increment” based on the chart analysis of past years. The past net increment would be completely removed in theory if only the limited number of BMG-titles which entered the charts in the last year and created this net increment in Universal's control were divested. The divestment of this limited number of past chart hits would, however, clearly not address the competition concern. The purpose of the Remedies Package is to avoid that Universal, through the proposed merger, gains a market position which enables it to exert market power vis-à-vis online and mobile music providers. In the prospective remedies assessment, the analysis of the impact on the control shares for past chart hits thus only constitutes one of several parameters together with the size, quality and composition of the catalogues and the potential of signed authors to generate future hits and thus revenues.

438. The following table shows the impact of the Remedies Package on the chart analysis in all Member States with affected markets for online rights:

Characteristics of divested catalogues – Impact on official charts 2006

	Sample Official Charts 2006	Chart titles controlled by BMG MP	Chart titles controlled by divested catalogues	BMG MP chart titles contributing to the increment	Titles in divested catalogues reducing the increment	Chart titles in divested catalogues which are not co-published by Universal
Austria	100	8,0%	2,0%	6,0%	1,0%	2,0%
Belgium	100	12,0%	4,0%	7,0%	1,0%	4,0%
Czech R.	200	16,5%	3,5%	9,5%	1,5%	3,5%
Finland	260	6,2%	1,5%	4,2%	1,2%	1,2%
France	100	10,0%	2,0%	9,0%	1,0%	2,0%
Germany	100	11,0%	4,0%	7,0%	2,0%	4,0%
Greece	667	7,2%	1,9%	5,7%	1,6%	1,8%
Hungary	100	13,0%	3,0%	7,0%	0,0%	3,0%
Italy	50	12,0%	2,0%	10,0%	2,0%	2,0%
Netherlands	100	15,0%	3,0%	10,0%	1,0%	3,0%
Poland	240	7,9%	4,2%	4,2%	1,7%	4,2%
Spain	260	9,2%	3,1%	8,1%	3,1%	3,1%
Sweden	100	9,0%	4,0%	6,0%	3,0%	4,0%
United Kingdom	100	19,0%	11,0%	10,0%	5,0%	11,0%
Norway	80	8,8%	3,8%	6,3%	2,5%	3,8%
Affected markets		13,3%	5,2%	8,6%	2,8%	5,2%

439. The table above shows that in all affected countries the catalogues of the Remedies Package are present in the charts of the annual best-selling titles. The catalogues of the Remedies Package further reduce the net increment in control shares brought about by BMG in all affected countries except Hungary. The above table also shows that almost none of the chart titles in the Remedies Package is co-published by Universal. This means that all those chart

titles in the Remedies Package which do not reduce the net increment in control shares were recorded by Universal in 2006. However, in the future they can be recorded by any record company and Universal would thus have no control of that title at all. As they charted in 2006 the compositions have proven their popularity and are therefore quite likely to be released in a cover version or as sample or extract in new songs (e.g. in rap or hip-hop).¹⁴⁹ They, therefore, have the potential to reduce Universal's control share in the future.

440. It is worth noting, that the remedies apply to the whole EEA and therefore have an effect also in the EEA-countries concerning which no serious doubts have been found.
441. In the United Kingdom, the Member State with the highest post-merger (pre-remedies) control share of Universal (61%), the highest number of chart titles controlled by BMG (19%) and one of the highest net increments (10%) and where Anglo-American music plays the most important role, the Remedies Package has the strongest effect. It contains 11% of the charted titles and halves the net increment (by 5%). In addition, the other 6% of charted titles are not co-published by Universal and would thus not be controlled at all by Universal in case of a future release by another record company.
442. In Germany where Universal's post-merger control share reaches 54% and BMG controls 11% of the chart hits and where the net increment amounts to 7%, the Remedies Package contains 4% of the chart hits and reduces the net increment by 2%. In addition, the other 2% of charted titles are not co-published by Universal and would thus not be controlled at all by Universal in case of a future release by another record company.
443. In Poland where Universal's post-merger control share reaches 51% and BMG controls 8% of the chart hits and where the net increment amounts to 4%, the Remedies Package contains 4% of the chart hits and halves the net increment (by 2%). In addition, the other 2% of charted titles are not co-published by Universal and would thus not be controlled at all by Universal in case of a future release by another record company.
444. In Austria where Universal's post-merger control share reaches 56% and BMG controls 8% of the chart hits and where the net increment amounts to 6%, the Remedies Package contains 2% of the chart hits and reduces the net increment by 1%. In addition, the other 1% of charted titles are not co-published by Universal and would thus not be controlled at all by Universal in case of a future release by another record company.
445. In the Czech Republic where Universal's post-merger control share reaches 52% and BMG controls 16.5% of the chart hits and where the net increment amounts to 9.5%, the Remedies Package contains 3.5% of the chart hits and reduces the net increment by 1.5%. In addition, the other 2% of charted titles are not co-published by Universal and would thus not be controlled at all by Universal in case of a future release by another record company.
446. On the level of all affected EEA countries where Universal's post-merger control share reaches 49-50% and BMG controls 13.3% of the chart hits and where the net increment amounts to 8.6%, the Remedies Package contains 5.2% of the chart hits and reduces the net increment by 2.8%. In addition, almost all of the other 2.4% of charted titles are not co-published by Universal and would thus not be controlled at all by Universal in case of a future release by another record company.

¹⁴⁹ According to the parties some songs in the divested catalogues have been recorded 20 or 30 times. See response to question 2 of questionnaire of 03.04.2007.

447. These examples illustrate that the Remedies Package has an important effect on Universal's control shares of chart hits. However, as explained above and as illustrated by the variations of chart relevant control shares both from year to year¹⁵⁰ and from country to country (for the same titles of the Remedies Package), the control shares in chart hits only constitute a proxy for the post-merger market position of Universal. It is therefore not necessary for the Remedies Package to remove most of the increment or compensates for all chart hits published by BMG. Instead, it is important that the Remedies Package contains a certain number of chart hits which have been successful in all affected Member States.
448. This also applies to Austria and the Czech Republic where the reduction of the increment brought about by the transaction is smaller than in other affected markets with serious doubts. In this respect it has to be recalled that the chart control analysis only represents a "snapshot" and is only one of several parameters taken into account by the Commission in its analysis of the Remedies Package.
449. On the basis of the analysis above it can therefore be concluded that the catalogues included in the Remedies Package have been present in the charts and are likely to continue to deliver hits which are of particular relevance for online and mobile music providers.

2.5 Quality and composition of the Remedies Package

450. The Remedies Package presents a good mixture of successful back catalogues and recent hits. It is composed of significant catalogues, both Anglo and American, with important works of renowned authors. It thus responds to two important requirements emphasised in the market tests.
451. Zomba UK is a strong catalogue with many chart number 1 hits and evergreens. It contains, for instance, the catalogues of Billy Ocean, Iron Maiden, Peter Sinfield (who wrote *inter alia* for Celine Dion, Cher, Cliff Richard, Barry Manilow and Diana Ross) and Mutt Lange (who wrote *inter alia* for Shania Twain, Bryan Adams, Huey Lewis and Michael Bolton). It also includes the Cheiron/Grantsville/Maratone catalogues with many titles written for Britney Spears, The Backstreet Boys, NSYNC, Bon Jovi, Celine Dion, Westlife and Kelly Clarkson. As these titles were successful hits at their time, they have very good chances of being reproduced as cover versions in the future. In addition, many of those past hits are regularly sampled in new rap and hip hop songs.
452. Zomba UK also has a number of recent chart hits and consequently a high potential for future hits. In 2006, Kelly Clarkson's "Since you've been gone" (written by Zomba UK authors Sandberg/Gottwald) was number 1 in the charts in Germany, Ireland, the Netherlands and the United Kingdom. Jamie T's debut album "Panic Prevention" (written by himself) entered the United Kingdom album charts at number 4 in January 2007. Zomba UK author Martin Brammer has written several songs, including the title track and "The Pieces don't fit" on James Morrison's recent debut album "Undiscovered" which charted in 2007. As analysed in detail below, Zomba UK also has signed a number of established and upcoming authors; it can therefore be reasonably expected that Zomba UK will continue to produce hits.

¹⁵⁰ See above in the Competitive Assessment: In 2006 BMG contributed to increase Universal control share in official charts by 9 percentage points on an EEA-wide level whereas in 2005 it only contributed to increase control shares of Universal by 6 percentage points.

453. Zomba U.S. is even better positioned as regards recent chart hits. It contains the works of Linkin Park (who had several chart hits in 2003 and 2004 and released their latest album in April 2007), R. Kelly (who had 13 number 1 hits), Justin Timberlake (who recently had several top chart hits such as "Sexyback", "My love" and "What goes around"), Korn (who charted in the United Kingdom and other Member States in 2005 and 2006 with "Coming Undone" and "Twisted Transistor", Ne-Yo (who had top chart hits in the United Kingdom and several other Member States in 2006 with "Sexy Love" (number 1 in the United Kingdom) and "So Sick" (number 5 in the United Kingdom) and who also wrote top chart hits for Mario ("Let me love you") and Rihanna ("Unfaithful") which both reached number 2 in several Member States.
454. Zomba U.S. also has a valuable back-catalogue, including Britney Spears (who co-wrote some of her hits), Shania Twain (who co-wrote four of her top ten hits), Macy Gray, Teddy Riley (who wrote for Blackstreet, Mary J. Blige and Michael Jackson). It is noteworthy that prior to its acquisition by BMG in 2002, Zomba was an important independent music publisher which had been very successful since the 1990s.
455. Rondor UK has a very strong back catalogue with more than 70 writers, including Mark Knopfler (Dire Straits), Wayne Hector (who co-wrote a number of Westlife chart hits, one of which has been already released in a successful cover version), William Orbit (who co-wrote six titles for Madonna), Nick Kershaw ("Wouldn't it be good"), Hammond and Hazelwood ("It never rains in Southern California" and "The air that I breathe" which has been released in numerous cover versions), Brenda Richie (who wrote for Lionel Richie hits such as "Hello", "All Night Long" and "Dancing on the Ceiling").
456. Rondor UK also has some recently very successful hit authors, in particular The Kaiser Chiefs (whose 2005 album "Employment" has brought four singles into the top 11 in the UK). Their latest album "Yours Truly, Angry Mob" was released in March 2007 and has already reached top album chart positions in several Member States (number 1 in Greece, the Netherlands and the United Kingdom). The first single release of this album, "Ruby" has hit the number 1 chart position in the United Kingdom and in the European singles charts. Another author with recent chart success is Sophie Ellis Bexter who had several chart hits in the years 2001-2004. Her latest album is due for release in May 2007 and the first single release of this album reached number 8 in the United Kingdom charts.
457. On the basis of the analysis above the Commission found that the catalogues included in the Remedies Package are of high quality and present a good mixture of recent hits and successful back catalogue. The latter can be expected to generate constant revenue flows (as it has done in the past) and to be the source for some successful cover versions in the future. The authors of recent hits seem particularly to meet the "current music taste" and usually write their own songs (in case of singer-songwriters such as The Kaiser Chiefs, Linkin Park, R. Kelly) or write for currently successful singers. It can therefore reasonably be expected that they will be able to maintain or repeat their success at least for the foreseeable future, i.e. the next album(s). In addition, some today's hits included in the Remedies Package have the potential to become "evergreens" and therefore to generate regular revenue streams and to be released again in cover versions.
458. The Remedies Package combines Anglo repertoire and U.S. American repertoire, as requested by several responses to the market tests. Zomba U.S. accounts for approximately one third of the EEA-wide revenues of the Remedies Package. The licensing of the repertoire of Zomba U.S. allows the acquirer to have direct access to U.S. hits which still

have a considerable impact on global hits. On the other hand, the European-wide success of The Kaiser Chiefs and other British groups (e.g Arctic Monkeys, Franz Ferdinand) shows that Anglo catalogue is very popular in Europe and therefore the larger part of the Remedies Package is composed of British catalogues.¹⁵¹

2.6 Potential of signed authors to produce future hits

459. The Remedies Package also contains an important percentage of BMG's top 200 authors, namely 58 (29%) which also account for [25-35]*% of the EEA revenues of BMG's top 200 authors. Rondor UK contributes four of Universal's global top 200 Anglo-American authors (and even 10 of the top 200 Anglo-American authors in terms of United Kingdom revenues) such as the Kaiser Chiefs, Chariscourt and Straitjacket Songs (Mark Knopfler).
460. Many of the most successful authors are still in their term, i.e. under contract. This means they have ongoing obligations to write or compose a certain number of works or, depending on the contracts, to publish via their publisher all works they create during the determined period of time. For instance Out of Pocket Productions (Mutt Lange) and Bruce Springsteen are still under contract with Zomba UK. The contracts with Daft Punk and The Delays are also still ongoing with another option (for extension) for Zomba UK. An option means that the publisher has the contractually agreed right to request an extension of the contract which implies that the author has to provide an additional number of works over a certain period of time. It is quite frequent that publisher and author stipulate several options, i.e. rights of extension, in the contract. In 19 Music, the contracts with the three most successful authors (Absoulte, Ray Hedges and Simon Ellis) are still running and 19 Music has another option for the contract with Simon Ellis. The contracts with the three top authors of 19 Songs are also still running, with an option for 19 Songs for one of them.
461. In Zomba U.S., the top [5-15]* authors ([...]*) are still under contract and Zomba U.S has [...]* options for [several]* of them. In Rondor UK, the contract with their top authors, The Kaiser Chiefs, is still ongoing and Rondor UK has at least [...]* to extend the contract. Contracts with Nik Kershaw and Deekay Music (both among Rondor UK's top 10 authors in 2006) and with Sophie Ellis Bextor (whose new album is to be released in [...]* 2007) are still ongoing with [...]*.
462. Moreover, the Remedies Package contains a high number of new authors with the potential to write future chart hits. [30-40]* of BMG's [60-70]* ([40-50]*%) newly signed authors in the United Kingdom since 01.01.2004 have been signed with Zomba UK and they have received advance payments of EUR [0-10]* million ([40-50]*% of all advances paid by BMG in the United Kingdom). Among these authors are Jamie T (advance payments of EUR [...]* and [...]*), Johnny Lipsey/Jony Rockstar (advance payments of EUR [...]* and [...]*), Ed Treacy/"Chopper Harris" (advance payments of EUR [...]* and [...]*), The Delays (advance payments of EUR [...]* and [...]*), M.I.A. (advance payments of EUR [...]* and [...]*), The Altekicks (advance payments of EUR [...]* and [...]*) and The Mystery Jets (advance payments of EUR [...]* and [...]*).
463. Also Zomba U.S. has signed [30-40]* new authors since 2003 and paid them more than US-\$ [0-10]* million from 2003 to 2006. This represents [10-20]*% of all authors signed in

¹⁵¹ It is noteworthy that there are also U.S. authors (e.g. writing for Britney Spears) have signed with Zomba UK.

the U.S. and [10-20]*% of the advances paid in the U.S. in that period. Among those authors are Ron Femster/Neff U (advance payments of US-\$ [...]*) and [...]*), Beau Dozier (advance payments of US-\$ [...]*) and [...]*), Cool & Dre (advance payments of US-\$ [...]*) and [...]*), The Bronx (advance payments of US-\$ [...]*) and [...]*), Brand New (advance payments of US-\$ [...]*) and [...]*), Ne-Yo (advance payments of US-\$ [...]*) and [...]*), T-Pain (advance payments of US-\$ [...]*) and [...]*)

464. These figures illustrate that considerable investments have been made in Zomba, and in particular in Zomba UK, and that the catalogues seem therefore well prepared for continuous success.

2.7 Geographical scope of the Remedies Package

465. The geographical scope of the Remedies Package is limited to the EEA. The catalogues Zomba UK, 19 Songs, 19 Music, BBC catalogue and Rondor UK will be assigned to the purchaser(s) who shall enter into an exclusive licensing agreement with Universal for the licensing back of the copyrights relating to the divested catalogues in respect of exploitation outside the EEA. The copyrights of Zomba U.S. in respect of exploitation in the EEA will be licensed to a purchaser.

466. The Commission considers the limitation of the geographical scope of the Remedies Package to be proportionate. The competition concerns identified by the Commission are confined to the markets for online music publishing rights in a number of EEA countries. In order to remove these competition concerns it is not necessary to prevent Universal from exploiting outside the EEA the music publishing rights contained in the Remedies Package. In the market test, some respondents stated that it would be preferable to have the catalogues divested for a worldwide exploitation. However, several answers to the market test also explained that the worldwide exploitation rights are not necessary for the viability of a catalogue. Many European publishers have conferred the overseas exploitation of their catalogues to foreign publishers either through sub-publishing agreements or in other ways.

467. With respect to the catalogues Zomba UK, 19 Songs, 19 Music, BBC catalogue and Rondor UK, the purchaser(s) will have ownership and control of the divested catalogues and the contractual relationship with the right owners (authors). The licensing back agreement which will transfer the exploitation rights for the areas outside the EEA to Universal will be negotiated at arm's length between the purchaser(s) and Universal and will be reflected in the purchase price of the divestment businesses. The mere receipt of licensing fees from Universal for the exploitation of the divested catalogues outside the EEA is not expected to negatively impact the exploitation of the divested catalogues by the purchaser(s) in the EEA and his/their competitive behaviour vis-à-vis Universal in the EEA. As it is in line with the standard business practice that publishers confer the exploitation of their catalogues in foreign territories to other publishers, the viability of the divested catalogues will not be affected.

468. Regarding Zomba U.S., the licensing agreement allows the purchaser (licensee) to exploit the full catalogue of Zomba U.S. in the EEA. The inclusion of Zomba U.S. strengthens the American repertoire in the Remedies Package and thus responds to the market test. The Commission considers that, under the specific circumstances of the present case, an assignment of this catalogue is not necessary. Zomba U.S. generates only [25-35]*% of its global revenues within the EEA whereas Zomba UK and Rondor UK achieve respectively

[60-70]*% and [70-80]*% of their global revenues within the EEA. In view of this geographical repartition of revenues it is acceptable that Zomba U.S. maintains the contractual relationship with the rights owners (authors) as it will be more familiar with the U.S. markets and negotiations with U.S. authors.

469. The terms of the licence agreement as set out in Schedule 3 of the Commitments will be negotiated at arm's length. Compositions existing at the date of the present decision shall be licensed on a royalty-free basis and be reflected in the purchase price. Thereby the purchaser/licensee will have to make an upfront payment but no more permanent royalty payments for the exploitation of existing works (without prejudice of the necessary payments to be made to authors). This structure should provide strong incentives to the purchaser/licensee to intensively exploit the licensed Zomba U.S. catalogue as he will not have to pass on any parts of the revenues to Universal. In addition, the licence agreement must not restrict the exploitation by the purchaser/licensee except for those restrictions contained in Zomba U.S.' agreements with its authors and licensors. In conclusion, the licence agreement for Zomba U.S. will thus enable the purchaser/licensee to compete effectively with Universal and other publishers in the EEA.

2.8 Conclusion on Remedies

470. In the light of the above the Commission concludes that the Final Remedies Package removes the serious doubts, both under an EEA-wide or national geographic market definition.

IX. CONDITIONS AND OBLIGATIONS

471. Under the first sentence of the second subparagraph of Article 8(2) of the Merger Regulation, the Commission may attach to its decision conditions and obligations intended to ensure that the undertakings concerned comply with the commitments they have entered into vis-à-vis the Commission with a view to rendering the concentration compatible with the common market.

472. The achievement of the measure that gives rise to the structural change of the market is a condition, whereas the implementing steps which are necessary to achieve this result are generally obligations on the parties. Where a condition is not fulfilled, the Commission decision declaring the merger to be compatible with the common market no longer stands. Where the undertakings concerned commit a breach of an obligation, the Commission may revoke the clearance decision in accordance with Article 8(5)(b) of the Merger Regulation. The undertakings concerned may also be subject to fines and periodic penalty payments under Articles 14(2)(d) and 15(1)(c) of the Merger Regulation.

473. In view of the foregoing, this Decision is conditional upon full compliance with the undertaking that the concentration will not be implemented unless and until the parties have signed a binding sales and purchase agreement with one or several purchasers over the Divestment Business pursuant to paragraph 1 of the Commitments and further described in paragraph 4 including Schedules 1 to 7, attached as Annex to this Decision. Furthermore, this Decision is conditional upon full compliance with paragraph 3 of the Commitments. The other parts of the Commitments are obligations.

X. CONCLUSION

474. It is accordingly concluded that the Commitments as set out in the Annex modify the notified concentration to such an extent that the serious doubts of the Commission as to the compatibility of that concentration with the common market are removed. The concentration should, therefore, be declared compatible with the common market pursuant to Article 8(2) of the Merger Regulation and with the EEA Agreement pursuant to Article 57 thereof, subject to compliance with the commitments set out in the Annex which is an integral part of this decision.

HAS ADOPTED THIS DECISION:

Article 1

The notified operation whereby Universal Music Group Inc. acquires sole control within the meaning of Article 3(1)(b) of Regulation (EEC) No 139/2004 of the whole of the undertaking BMG Music Publishing is hereby declared compatible with the common market and the EEA Agreement.

Article 2

Article 1 is subject to compliance with the conditions set out in Section B, paragraphs 1, 3 and 4 (including Schedules 1-7) of the final version of the Commitments submitted by the parties on 23 April 2007 (attached as Annex to this Decision).

Article 3

Article 1 is subject to compliance with the obligations set out in the remaining provisions of Section B and in Sections C, D and E of the final version of the Commitments submitted by the parties on 23 April 2007 (attached as Annex to this Decision).

Article 4

This Decision is addressed to:

Universal Music Group, Inc.
1755 Broadway
United States of America - 10019 New
York, NY

Done at Brussels, 22/V/2007

For the Commission
Neelie KROES
Member of the Commission

**Case COMP/M.4404 Universal/BMG Music Publishing
COMMITMENTS TO THE EUROPEAN COMMISSION**

Pursuant to Articles 8(2) and 10(2) of Council Regulation No. 139/2004/EC as amended (the “**Merger Regulation**”), Universal Music Group, Inc (the “**Notifying Party**”) hereby provides the following Commitments (the “**Commitments**”) in order to enable the European Commission (the “**Commission**”) to declare the acquisition of BMG MP by the Notifying Party (the “**Notified Concentration**”) compatible with the common market and the EEA Agreement by its decision pursuant to Article 8(2) of the Merger Regulation (the “**Decision**”).

The Commitments shall take effect upon the date of adoption of the Decision.

This text shall be interpreted in the light of the Decision to the extent that the Commitments are attached as conditions and obligations, in the general framework of Community law, in particular in the light of the Merger Regulation, and by reference to the Commission Notice on remedies acceptable under Council Regulation (EEC) No 4064/89 and under Commission Regulation (EC) No 447/98.

Section A. Definitions

For the purpose of the Commitments, the following terms shall have the following meaning:

Affiliated Undertakings: undertakings controlled by UMG and/or by the ultimate parent company of UMG (i.e. Vivendi S.A.), whereby the notion of control shall be interpreted pursuant to Article 3 Merger Regulation and in the light of the Commission Notice on the concept of concentration under Council Regulation (EEC) No 4064/89.

BMG MP: BMG Music Publishing is the music publishing division of Bertelsmann AG, a German stock corporation with its registered office in Guetersloh, Germany, registered in the commercial register of the local court Guetersloh, Germany, under HR B 3100

Closing: the transfer of the legal title of the Divestment Businesses to the Purchaser.

Divestment Businesses: the business or businesses as defined in Section B and Schedules 1 to 7 that the Notifying Party commits to divest.

Divestiture Trustee: one or more natural or legal person(s), independent from the Notifying Party, who is approved by the Commission and appointed by UMG and who has received from UMG the exclusive Trustee Mandate to sell the Divestment Businesses to one or several Purchasers at no minimum price.

Effective Date: the date of adoption of the Decision by the European Commission.

First Divestiture Period: the period of **[Business Secret]** months from the Effective Date.

Hold Separate Manager: the person appointed by UMG for the Divestment Businesses to manage the day-to-day business under the supervision of the Monitoring Trustee.

Monitoring Trustee: one or more natural or legal person(s), independent from the Notifying Party, who is approved by the Commission and appointed by UMG and who has the duty to monitor UMG's compliance with the conditions and obligations attached to the Decision.

Notifying Party: the company Universal Music Group, Inc, incorporated under the laws of Delaware, with its registered office at 1755 Broadway, New York, NY 10019, USA and registered with the State of Delaware Division of Corporations under number 2961379

Personnel: personnel listed in Schedule 2

Purchaser: each entity approved by the Commission as acquirer of the Divestment Businesses in accordance with the criteria set out in Section D.

Trustee(s): the Monitoring Trustee and the Divestiture Trustee.

Trustee Divestiture Period: the period of **[Business Secret]** months from the end of the First Divestiture Period.

UMG: incorporated under the laws of Delaware with its registered office at 1755 Broadway, New York, NY10019 and registered with the State of Delaware Division of Corporations under number 2961379.

Vivendi SA: a French Société Anonyme whose principal place of business is at 42 avenue de Friedland, 75380 Paris, France

Zomba US: the business defined in Schedule 3.

Section B. The Divestment Businesses

Commitment to divest

1. In order to restore effective competition, UMG commits to divest, or procure the divestiture of the Divestment Businesses by the end of the Trustee Divestiture Period as a going concern to a purchaser(s) and on terms of sale approved by the Commission in accordance with the procedure described in paragraph 15. To carry out the divestiture, the Notifying Party commits to find a purchaser(s) and to enter into a final binding sale and purchase agreement for the sale of the Divestment Businesses within the First Divestiture Period. If the Notifying Party has not entered into such an agreement at the end of the First Divestiture Period, the Notifying Party shall grant the Divestiture Trustee an exclusive mandate to sell the Divestment Businesses in accordance with the procedure described in paragraph 24 in the Trustee Divestiture Period.
2. The Notifying Party shall be deemed to have complied with this commitment if, by the end of the Trustee Divestiture Period, the Notifying Party has entered into the final binding sale and purchase agreements, if the Commission approves the Purchaser and the terms in accordance with the procedure described in paragraph 15 and if the closing of the sale of the Divestment Businesses takes place within a period not exceeding **[Business Secret]** months after the approval of the respective purchaser and the terms of sale by the Commission.
3. In order to maintain the structural effect of the Commitments, the Notifying Party and its Affiliated Undertakings shall, for a period of **[Business Secret]** years after the Effective Date, not acquire direct or indirect influence over the whole or part of the Divestment Businesses, nor solicit writers forming part of the Divestment Businesses in order for them to enter into music publishing agreements for exploitation of their rights within the EEA, unless the Commission has previously found that the structure of the market has changed to such an extent that the absence of influence over the Divestment Businesses is no longer necessary to render the proposed concentration compatible with the common market. For the avoidance of doubt, and subject to the terms of the licensing of the Compositions from Zomba US as described in Schedule 3 of these Commitments, this clause shall not apply to any writers or compositions which are the subject of the licence from Zomba US, described in Schedule 3 of these Commitments.

Structure and definition of the Divestment Businesses

4. The Divestment Businesses consist of a number of self standing corporate entities (subject to the collection of copyrights described at Schedule 6 of these Commitments) which contain the

music publishing rights of varying durations, including the rights to future compositions, for a balanced and diverse portfolio of Anglo-American music catalogues, ranging from some of today's most successful authors, back catalogue to evergreen tracks and a number of exciting up and coming authors. The present legal and functional structure of the Divestment Businesses as operated to date is described in Schedules 1 to 7. The Divestment Businesses, described in more detail in the Schedules, include:

- (a) all existing tangible and intangible assets (including all copyrights in musical works ("**Copyrights**") and other intellectual property rights), which contribute to the current operation or are necessary to ensure the viability and competitiveness of the Divestment Businesses. The Purchaser shall enter into an exclusive licensing agreement with UMG or one of its Affiliated Undertakings for the licensing back of the Copyrights relating to the Divestment Businesses in respect of exploitation outside the EEA, the key elements of which will be as follows:
 - (i) the Purchaser will have ownership and control of the Divestment Businesses and the contractual relationship with the rights owner;
 - (ii) the Copyrights will include those currently in existence and those to be delivered under existing agreements and any renewals of those agreements; and
 - (iii) the financial terms will be those negotiated at arms length with the Purchaser and will be reflected in the purchase price of the Divestment Businesses.
- (b) all licences, permits and authorisations issued by any governmental organisation for the benefit of the Divestment Businesses; and
- (c) all contracts, leases, commitments and customer orders of the Divestment Businesses; all customer, credit and other records of the Divestment Businesses (items referred to under (a)-(c) hereinafter collectively referred to as "**Assets**");
- (d) all licences for the popular music Copyrights held by Zomba US in respect of exploitation in the EEA, the key elements of which will be as follows:

- (i) UMG or its Affiliated Undertakings shall have the contractual relationship with the rights owner;
- (ii) The Copyrights will include those currently in existence, and those to be delivered, under existing agreements, and those to be delivered following the exercise of any options provided for under existing agreements; and
- (iii) The financial and other terms will be as set out at Schedule 3 of these Commitments.

Section C. Related commitments

Preservation of Viability, Marketability and Competitiveness

5. From the Effective Date until Closing, the Notifying Party shall preserve the economic viability, marketability and competitiveness of the Divestment Businesses, in accordance with good business practice, and shall minimise as far as possible any risk of loss of competitive potential of the Divestment Businesses. In particular the Notifying Party undertakes:
- (a) not to carry out any act upon its own authority that might have a significant adverse impact on the value, management or competitiveness of the Divestment Businesses or that might alter the nature and scope of activity, or the industrial or commercial strategy or the investment policy of the Divestment Businesses;
 - (b) to make available sufficient resources for the development of the Divestment Businesses, on the basis and continuation of the existing business plans;
 - (c) to make best efforts, including appropriate incentive schemes or other benefits (based on industry practice), to encourage the Personnel to remain with that part of the Divestment Businesses described in Schedule 2;
 - (d) to renew options arising in contracts forming part of the Divestment Businesses, where it would be commercially reasonable to do so; and
 - (e) not to transfer any Copyrights out of the Divestment Businesses.

Hold-separate obligations of the Notifying Party

6. The Notifying Party commits, from the Effective Date until Closing, to keep the Divestment Businesses separate from the businesses it is retaining and to ensure that the Personnel and the Hold Separate Manager have no involvement in any business retained and vice versa. The Notifying Party shall also ensure that the Personnel do not report to any individual outside the Divestment Businesses.
7. Until Closing, the Notifying Party shall assist the Monitoring Trustee in ensuring that the Divestment Businesses are managed as distinct and saleable entities separate from the businesses retained by the Notifying Party. The Notifying Party shall appoint a Hold Separate Manager who shall be responsible for the management of the Divestment Businesses, under the supervision of the Monitoring Trustee. The Hold Separate Manager shall manage the Divestment Businesses independently and in the best interest of the respective businesses with a view to ensuring their continued economic viability, marketability and competitiveness and their independence from the businesses retained by the Notifying Party.
8. To ensure that the Divestment Businesses are held and managed as separate entities the Monitoring Trustee shall exercise the Notifying Party's rights as shareholder in the Divestment Businesses (except for its rights for dividends that are due before Closing), with the aim of acting in the best interest of the businesses, determined on a stand-alone basis, as an independent financial investor, and with a view to fulfilling the Notifying Party's obligations under the Commitments. Furthermore, the Monitoring Trustee shall have the power to replace members of the supervisory board or non-executive directors of the board of directors, who have been appointed on behalf of the Notifying Party. Upon request of the Monitoring Trustee, the Notifying Party shall resign as member of the boards or shall cause such members of the boards to resign.

Ring-fencing

9. The Notifying Party shall implement all necessary measures to ensure that it does not after the Effective Date obtain any business secrets, know-how, commercial information, or any other information of a confidential or proprietary nature relating to the Divestment Businesses, other than in respect of royalty processing, copyright registration and other administration and

accounting services carried out in the ordinary course of business, such services to be overseen by the Monitoring Trustee insofar as they relate to the Divestment Businesses, and other than is necessary for the implementation of the provisions of Schedule 3 in respect of the licensing of the Compositions as described therein. In particular, the participation of the Divestment Businesses in a central information technology network shall be severed to the extent possible, without compromising the viability of the Divestment Businesses. The Notifying Party may obtain information relating to the Divestment Businesses which is reasonably necessary for the divestiture of the Divestment Businesses or whose disclosure to the Notifying Party is required by law.

Non-solicitation clause

10. The Notifying Party undertakes, subject to customary limitations, not to solicit, and to procure that Affiliated Undertakings do not solicit, the Personnel for a period of **[Business Secret]** years after Closing, to the extent that the Personnel are transferred to the Purchaser after closing.

Due Diligence

11. In order to enable potential purchasers to carry out a reasonable due diligence of the Divestment Businesses, the Notifying Party shall, subject to customary confidentiality assurances and dependent on the stage of the divestiture process:
 - (a) provide to potential purchasers sufficient information as regards the Divestment Businesses;
 - (b) provide to potential purchasers sufficient information relating to the Personnel and allow them reasonable access to the Personnel.

Reporting

12. The Notifying Party shall submit written reports in English on potential purchasers of the Divestment Businesses and developments in the negotiations with such potential purchasers to the Commission and the Monitoring Trustee no later than 10 days after the end of every month following the Effective Date (or otherwise at the Commission's request).
13. The Notifying Party shall inform the Commission and the Monitoring Trustee on the preparation of the data room documentation and the due diligence procedure and shall submit a copy of an

information memorandum to the Commission and the Monitoring Trustee before sending the memorandum out to potential purchasers.

Section D. The Purchaser

14. In order to ensure the immediate restoration of effective competition, the purchaser(s), in order to be approved by the Commission, must:
- (a) be independent of and unconnected to the Notifying Party, subject to paragraph 4(a);
 - (b) have the financial resources, proven expertise and incentive to maintain and develop the Divestment Businesses as viable and active competitive forces in competition with the Notifying Party and other competitors;
 - (c) neither be likely to create, in the light of the information available to the Commission, *prima facie* competition concerns nor give rise to a risk that the implementation of the Commitments will be delayed, and must, in particular, reasonably be expected to obtain all necessary approvals from the relevant regulatory authorities for the acquisition of the Divestment Businesses (the before-mentioned criteria for the purchaser hereafter the "**Purchaser Requirements**").
15. The final binding sale and purchase agreement or agreements and all ancillary agreements shall be conditional on the Commission's approval. When the Notifying Party has reached an agreement with a purchaser, it shall submit a fully documented and reasoned proposal, including a copy of the final agreement(s), to the Commission and the Monitoring Trustee. The Notifying Party must be able to demonstrate to the Commission that each purchaser meets the Purchaser Requirements and that the Divestment Businesses are being sold in a manner consistent with the Commitments. For the approval, the Commission shall verify that the purchaser fulfils the Purchaser Requirements and that the Divestment Businesses are being sold in a manner consistent with the Commitments. The Commission may approve the sale of the Divestment Businesses without one or more Assets, if this does not affect the viability and competitiveness of the Divestment Businesses after the sale, taking account of the proposed purchaser.

Section E. Trustee

I. Appointment Procedure

16. The Notifying Party shall appoint a Monitoring Trustee to carry out the functions specified in the Commitments for a Monitoring Trustee. If the Notifying Party has not entered into a binding sales and purchase agreement(s) for each of the Divestment Businesses one month before the end of the First Divestiture Period or if the Commission has rejected a purchaser proposed by the Notifying Party at that time or thereafter, the Notifying Party shall appoint a Divestiture Trustee to carry out the functions specified in the Commitments for a Divestiture Trustee. The appointment of the Divestiture Trustee shall take effect upon the commencement of the Extended Divestment Period.
17. The Trustee shall be independent of the Notifying Party, possess the necessary qualifications to carry out its mandate, for example as an investment bank or consultant or auditor, and shall neither have nor become exposed to a conflict of interest. The Trustee shall be remunerated by the Notifying Party in a way that does not impede the independent and effective fulfilment of its mandate. In particular, where the remuneration package of a Divestiture Trustee includes a success premium linked to the final sale value of the Divestment Businesses, the fee shall also be linked to a divestiture within the Trustee Divestiture Period.

Proposal by the Notifying Party

18. No later than one week after the Effective Date, the Notifying Party shall submit a list of one or more persons whom the Notifying Party proposes to appoint as the Monitoring Trustee to the Commission for approval. No later than one month before the end of the First Divestiture Period, the Notifying Party shall submit a list of one or more persons whom the Notifying Party proposes to appoint as Divestiture Trustee to the Commission for approval. The proposal shall contain sufficient information for the Commission to verify that the proposed Trustee fulfils the requirements set out in paragraph 17 and shall include:
 - (a) the full terms of the proposed mandate, which shall include all provisions necessary to enable the Trustee to fulfil its duties under these Commitments;

- (b) the outline of a work plan which describes how the Trustee intends to carry out its assigned tasks; and
- (c) an indication whether the proposed Trustee is to act as both Monitoring Trustee and Divestiture Trustee or whether different trustees are proposed for the two functions.

Approval or rejection by the Commission

19. The Commission shall have the discretion to approve or reject the proposed Trustee(s) and to approve the proposed mandate subject to any modifications it deems necessary for the Trustee to fulfil its obligations. If only one name is approved, the Notifying Party shall appoint or cause to be appointed, the individual or institution concerned as Trustee, in accordance with the mandate approved by the Commission. If more than one name is approved, the Notifying Party shall be free to choose the Trustee to be appointed from among the names approved. The Trustee shall be appointed within one week of the Commission's approval, in accordance with the mandate approved by the Commission.

New proposal by the Notifying Party

20. If all the proposed Trustees are rejected, the Notifying Party shall submit the names of at least two more individuals or institutions within one week of being informed of the rejection, in accordance with the requirements and the procedure set out in paragraphs 16 and 19.

Trustee nominated by the Commission

21. If all further proposed Trustees are rejected by the Commission, the Commission shall nominate a Trustee, whom the Notifying Party shall appoint, or cause to be appointed, in accordance with a trustee mandate approved by the Commission.

II. Functions of the Trustee

22. The Trustee shall assume its specified duties in order to ensure compliance with the Commitments. The Commission may, on its own initiative or at the request of the Trustee or the Notifying Party, give any orders or instructions to the Trustee in order to ensure compliance with the conditions and obligations attached to the Decision.

Duties and obligations of the Monitoring Trustee

23. The Monitoring Trustee shall:

- (i) propose in its first report to the Commission a detailed work plan describing how it intends to monitor compliance with the obligations and conditions attached to the Decision.
- (ii) oversee the on-going management of the Divestment Businesses with a view to ensuring its continued economic viability, marketability and competitiveness and monitor compliance by the Notifying Party with the conditions and obligations attached to the Decision. To that end the Monitoring Trustee shall:
 - (a) monitor the preservation of the economic viability, marketability and competitiveness of the Divestment Businesses, and the keeping separate of the Divestment Businesses from the business retained by the Notifying Party, in accordance with paragraphs 5 and 6 of the Commitments;
 - (b) supervise the management of the Divestment Businesses as distinct and saleable entities, in accordance with paragraph 7 of the Commitments;
 - (c) (i) in consultation with the Notifying Party and subject to paragraph 9 of the Commitments, determine all necessary measures to ensure that the Notifying Party does not after the Effective Date obtain any business secrets, know-how, commercial information, or any other information of a confidential or proprietary nature relating to the Divestment Businesses, and in particular strive for the severing of the Divestment Businesses' participation in a central information technology network to the extent possible, without compromising the viability of the Divestment Businesses, and (ii) decide whether such information may be disclosed to the Notifying Party as the disclosure is reasonably necessary to allow the Notifying Party to carry out the divestiture or as the disclosure is required by law;

- (d) as applicable, monitor the splitting of assets and the allocation of Personnel between the Divestment Businesses and the Notifying Party or Affiliated Undertakings;
- (iii) assume the other functions assigned to the Monitoring Trustee under the conditions and obligations attached to the Decision;
- (iv) propose to the Notifying Party such measures as the Monitoring Trustee considers necessary to ensure the Notifying Party's compliance with the conditions and obligations attached to the Decision, in particular the maintenance of the full economic viability, marketability or competitiveness of the Divestment Businesses, the holding separate of the Divestment Businesses and the non-disclosure of competitively sensitive information;
- (v) review and assess potential purchasers as well as the progress of the divestiture process and verify that, dependent on the stage of the divestiture process, (a) potential purchasers receive sufficient information relating to the Divestment Businesses and the Personnel in particular by reviewing, if available, the data room documentation, the information memorandum and the due diligence process, and (b) potential purchasers are granted reasonable access to the Personnel;
- (vi) provide to the Commission, sending the Notifying Party a non-confidential copy at the same time, a written report within 15 days after the end of every month. The report shall cover the operation and management of the Divestment Businesses so that the Commission can assess whether the business is held in a manner consistent with the Commitments and the progress of the divestiture process as well as potential purchasers. In addition to these reports, the Monitoring Trustee shall promptly report in writing to the Commission, sending the Notifying Party a non-confidential copy at the same time, if it concludes on reasonable grounds that the Notifying Party is failing to comply with these Commitments;
- (vii) within one week after receipt of the documented proposal referred to in paragraph 15, submit to the Commission a reasoned opinion as to the suitability and independence of the proposed purchaser and the viability of the Divestment Businesses after the Sale

and as to whether the Divestment Businesses are sold in a manner consistent with the conditions and obligations attached to the Decision, in particular, if relevant, whether the Sale of the Divestment Businesses without one or more Assets or not all of the Personnel affects the viability of the Divestment Businesses after the sale, taking account of the proposed purchaser.

Duties and obligations of the Divestiture Trustee

24. Within the Trustee Divestiture Period, the Divestiture Trustee shall sell at no minimum price the Divestment Businesses to a purchaser(s), provided that the Commission has approved both the purchaser and the final binding sale and purchase agreement(s) in accordance with the procedure laid down in paragraph 15. The Divestiture Trustee shall include in the sale and purchase agreement(s) such terms and conditions as it considers appropriate for an expedient sale in the Trustee Divestiture Period. In particular, the Divestiture Trustee may include in the sale and purchase agreement(s) such customary representations and warranties and indemnities as are reasonably required to effect the sale. The Divestiture Trustee shall protect the legitimate financial interests of the Notifying Party, subject to the Notifying Party's unconditional obligation to divest at no minimum price in the Trustee Divestiture Period.
25. In the Trustee Divestiture Period (or otherwise at the Commission's request), the Divestiture Trustee shall provide the Commission with a comprehensive monthly report written in English on the progress of the divestiture process. Such reports shall be submitted within 15 days after the end of every month with a simultaneous copy to the Monitoring Trustee and a non-confidential copy to the Notifying Party.

III. *Duties and obligations of the Notifying Party*

26. The Notifying Party shall provide and shall cause its advisors to provide the Trustee with all such cooperation, assistance and information as the Trustee may reasonably require to perform its tasks. The Trustee shall have full and complete access to any of the Notifying Party's or the Divestment Businesses' books, records, documents, management or other personnel, facilities, sites and technical information necessary for fulfilling its duties under the Commitments and the Notifying Party and the Divestment Businesses shall provide the Trustee upon request with copies of any document. The Notifying Party and the Divestment Businesses shall make

available to the Trustee one or more offices on their premises and shall be available for meetings in order to provide the Trustee with all information necessary for the performance of its tasks.

27. The Notifying Party shall provide the Monitoring Trustee with all managerial and administrative support that it may reasonably request on behalf of the management of the Divestment Businesses. This shall include all administrative support functions relating to the Divestment Businesses which are currently carried out at headquarters level. The Notifying Party shall provide and shall cause its advisors to provide the Monitoring Trustee, on request, with the information submitted to potential purchasers, in particular give the Monitoring Trustee access to the data room documentation and all other information granted to potential purchasers in the due diligence procedure the Notifying Party shall inform the Monitoring Trustee on possible purchasers, submit a list of potential purchasers, and keep the Monitoring Trustee informed of all developments in the divestiture process.
28. The Notifying Party shall grant or procure Affiliated Undertakings to grant comprehensive powers of attorney, duly executed, to the Divestiture Trustee to effect the sale, the Closing and all actions and declarations which the Divestiture Trustee considers necessary or appropriate to achieve the sale and the Closing, including the appointment of advisors to assist with the sale process. Upon request of the Divestiture Trustee, the Notifying Party shall cause the documents required for effecting the sale and the Closing to be duly executed.
29. The Notifying Party shall indemnify the Trustee and its employees and agents (each an "**Indemnified Party**") and hold each Indemnified Party harmless against, and hereby agrees that an Indemnified Party shall have no liability to the Notifying Party for any liabilities arising out of the performance of the Trustee's duties under the Commitments, except to the extent that such liabilities result from the wilful default, recklessness, gross negligence or bad faith of the Trustee, its employees, agents or advisors.
30. At the expense of the Notifying Party, the Trustee may appoint advisors (in particular for corporate finance or legal advice), subject to the Notifying Party's approval (this approval not to be unreasonably withheld or delayed) if the Trustee considers the appointment of such advisors necessary or appropriate for the performance of its duties and obligations under the Mandate,

provided that any fees and other expenses incurred by the Trustee are reasonable. Should the Notifying Party refuse to approve the advisors proposed by the Trustee the Commission may approve the appointment of such advisors instead, after having heard the Notifying Party. Only the Trustee shall be entitled to issue instructions to the advisors. Paragraph 29 shall apply mutatis mutandis. In the Trustee Divestiture Period, the Divestiture Trustee may use advisors who served the Notifying Party during the Divestiture Period if the Divestiture Trustee considers this in the best interest of an expedient sale.

IV. Replacement discharge and reappointment of the Trustee

31. If the Trustee ceases to perform its functions under the Commitments or for any other good cause, including the exposure of the Trustee to a conflict of interest:
 - (a) the Commission may, after hearing the Trustee, require the Notifying Party to replace the Trustee; or
 - (b) the Notifying Party, with the prior approval of the Commission, may replace the Trustee.
32. If the Trustee is removed according to paragraph 31, the Trustee may be required to continue in its function until a new Trustee is in place to whom the Trustee has effected a full hand over of all relevant information. The new Trustee shall be appointed in accordance with the procedure referred to in paragraphs 16-21.
33. Beside the removal according to paragraph 31, the Trustee shall cease to act as Trustee only after the Commission has discharged it from its duties after all the Commitments with which the Trustee has been entrusted have been implemented. However, the Commission may at any time require the reappointment of the Monitoring Trustee if it subsequently appears that the relevant remedies might not have been fully and properly implemented.

Section F. The Review Clause

34. The Commission may, where appropriate, in response to a request from the Notifying Party showing good cause and accompanied by a report from the Monitoring Trustee:

- (i) Grant an extension of the time periods foreseen in the Commitments, or
- (ii) Waive, modify or substitute, in exceptional circumstances, one or more of the undertakings in these Commitments.

Where the Notifying Party seeks an extension of a time period, it shall submit a request to the Commission no later than one month before the expiry of that period, showing good cause. Only in exceptional circumstances shall the Notifying Party be entitled to request an extension within the last month of any period.

.....

duly authorised for and on behalf of
the Notifying Party

23 April 2007

SCHEDULE 1

The Divestment Businesses as operated to date have the following legal and functional structure:

1 The Divestment Businesses are made up of the following companies:

- Zomba Music Publishers Limited
- Newco Limited (as described in Schedule 3)
- Rondor Music (London) Limited
- 19 Music Limited
- 19 Songs Limited
- BMG MP's BBC music publishing catalogue

2 In Schedules 2 to 7 which follow, revenues generated by each catalogue have been reported on the basis of revenues currently passed on to the legal entity in question, within the context of a broader group of local music publishing entities (either BMG MP or UMPG in the UK).

However, actual revenues generated by each of these catalogues are higher than those shown in Schedules 2 to 7 **[Business Secret]**.

SCHEDULE 2 – Zomba Music Publishers Limited

Summary

Zomba Music Publishers Limited (“ZMPL”) is a separate legal entity within BMG Music Publishing. ZMPL has been associated with some of the most successful Anglo American pop acts throughout the 1980s, 1990s, and 2000s, is a very significant and competitive music publishing catalogue, has a huge roster of current successful authors, with an independent, stand-alone creative infrastructure, which generated revenues of **€[5 - 10 million]** in the EEA and **€[10 - 20 million]** globally in 2006.

All staff are currently employed by BMG Music Publishing.

Asset Description

The ZMPL music catalogue consists of the following:

- Cheiron/ Grantsville/ Maratone – the various company names associated with Denniz Pop and Max Martin. Denniz and Max started one of the most successful writer/production teams in pop music history and shaped the modern pop sound of the 1990’s. After Denniz’s untimely death Max has continued to be one of the most in demand pop writers. Artists whose careers have been shaped by Denniz and Max include Britney Spears, The Backstreet Boys, NSYNC, Celine Dion, Westlife and Kelly Clarkson. Collectively they are responsible for 250 million album unit sales worldwide.
- Iron Maiden – one of the UK’s most successful rock bands selling in excess of 80 million records worldwide. Over 15 albums recorded and signed to Zomba Music from the start of their career.
- A Flock Of Seagulls – one of the first signings to Jive Records and one of the first UK bands from the MTV generation to break the US market. Their single ‘I

Ran' was one of the first videos to be championed by MTV and the album that the single was from went on to sell over 1 million units in the US.

- Billy Ocean – for many years Billy was the UK's best selling black artist. Still name checked and highly regarded by many current rap/hip hop stars.
- The Stone Roses – their debut eponymous album was recently voted by readers of the NME as the Greatest Album of All time. The catalogue of only one album for Silvertone Records / ZMPL continues to be one of the biggest earners.
- Mutt Lange – officially the most successful record producer of all time Mutt Lange has been the backbone of the company since its formation. Currently married to Shania Twain, Mutt has co-written her material. She has sold 100 million records worldwide. Other artists that Mutt has written hits for include Billy Ocean, Def Leppard, Bryan Adams, Michael Bolton, Huey Lewis, Billy Ray Cyrus, Heart, Britney Spears, Celine Dion, The Corrs and many more.
- Bruce Springsteen – ZMPL looks after the catalogue of Bruce Springsteen for the UK & Eire.
- Peter Sinfield – ZMPL acquired the catalogue of songwriter Peter Sinfield in 2005. Included are huge hits from Celine Dion 'Think Twice', Cher 'Heart Of Stone' and hits from Leo Sayer, Cliff Richard, Barry Manilow, Diana Ross, Five Star, Bucks Fizz & Gene Pitney. Peter has recently been back in the album charts with his song 'Have You Ever Been In Love' that was originally recorded by Leo Sayer and more recently by Westlife on their million selling 'Love' album.
- Current writers from the company include former BBMak frontman Christian Burns

- Vile Music – ZMPL has the largest catalogue of black/thrash metal in the world through one of its publishing divisions Vile Music. Vile Music signs songwriters introduced to it under a consultancy agreement with a record company run by Paul Halmshaw called Peaceville Records. We control the back catalogue of the trendsetting acts in this genre, such as Paradise Lost, Opeth & Cradle Of Filth and publish some of the hottest new acts in the world of metal including Anathema, Darkthrone, Madder Mortem, Novembre, My Dying Bride, Katatonia, Old & The Provence.
- Other selected highlights include writer Tim Friese Green's share of the Talk Talk song 'Its My Life' recently covered by No Doubt, Twisted Sister 'We're Not Gonna Take It', Jo Boxers 'Just Got Lucky' (featured in several big US movies in 2005/6), Steps '5678', Jona Lewie 'Stop The Cavalry', Gabrielle 'Dreams'.

Current active deals signed to ZMPL include:

- Daft Punk – French dance duo that have sold more than 7 million albums worldwide and have had their music used extensively in advertising including ads for iTunes & Motorola. Currently recording a new album for release later this year.
- Delays – Southampton based band that have released two albums on indie Rough Trade Records and have sold 250K units. The band is now working on a new album due for release 4Q07. They have also been successful in the synch world securing major ad campaigns for Bulldog Broadband, DeBeers Diamonds' & Sprite.

- Jamie T – one of our newer signings, Jamie T released his debut album ‘Panic Prevention’ in January 2007. The album entered at number 4 on the UK album chart and has so far sold 200K units. Jamie was also voted best solo artist at the 2007 NME awards.
- M.I.A – signed to XL Records in the UK and Interscope for America her debut album ‘Arular’ has now sold over 250,000 units worldwide. She has also co-written with Missy Elliot for her last album. M.I.A music has featured in a variety of ads including Honda cars. M.I.A is currently putting the finishing touches to her second album with producer Timbaland (Justin Timberlake/ Nelly Furtado) that is due for release 4Q07.
- Laura Izibor – Dublin based singer songwriter whose debut album is due for release 3Q07.
- The Mystery Jets – one of the most talked about acts on the UK indie scene in 2006. Their debut album ‘Making Dens’ has sold over 100,000 copies and they are currently putting the finishing touches to their second album due 3Q07.
- Nitin Sawhney – highly acclaimed artist and composer who has recently scored his first Hollywood movie ‘The Namesake’ for Fox Pictures. He has scored over 10 international films and provided music for numerous TV shows and ads including the BBC’s Natural World Symphony, and ads for Nike & The Financial Times. He has recently provided the score for the forthcoming Playstation 3 game ‘Heavenly Sword’. As an artist he has released 7 albums in his own right and has collaborated with Sir Paul McCartney.
- The Eagles Of Death Metal (“EODM”) – a side project from Queens Of The Stone Age front man Josh Homme and Jesse Hughes. ZMPL publishes Jesse.

EODM have sold over 200,000 albums sold so far and their music has been used in ads for VW, Budweiser, Wendy's, Microsoft Zune, Nissan and numerous TV shows and films.

- Kate Havnevik – London based Norwegian artist who has had huge success in the US with her music being used in numerous TV shows including The West Wing, The OC, and seven different songs being used in Grey's Anatomy. A total of [Business Secret] TV synchs so far. Kate's debut album 'Melankton' will be released on 27 March.
- Lethal Bizzle – the UK's leading grime MC. His debut album sold 60,000 units. His second album is due for release in May and features collaborations with new buzz acts Kate Nash and Mr Hudson and The Library.
- Alterkicks – a development project who are about to release their debut single. Their album has been produced by the acclaimed producer Stephen Street (The Smiths, Blur) and is set for release 3Q07.
- Chopper Harris – newly signed and currently working on his debut album due later this year.
- Other current signings that are in development are singer songwriter Vijay Kishore, 3 piece guitar band Freerunner and pop rock act Mamas Gun.
- Martin Brammer – Martin has written hits in the past for The Lighthouse Family, Tina Turner, Rachel Stevens & Nick Carter. He currently has several songs on the million selling debut album by James Morrison including the single 'The Pieces Don't Fit' and title track 'Undiscovered'. James Morrison has also recently won a Brit Award. Martin has also co-written five tracks with Beverly Knight for her new album that is due for release at the end of April. Martin has

five cuts on the forthcoming album by Jack MacManus and several cuts on debut act Jonas. He has two songs on debut artist Adam Argyle's album and numerous other songs cut with a whole range of acts including German Pop Idol.

- Jony Rockstar – writer producer known mainly for his work with The Sugababes. He has written several of their biggest hits. Currently working with ex Sugababe Mutya on her debut solo album, he is also writing with Cathy Dennis and Jennifer Lopez for her album. He has cuts on forthcoming albums from Siobahn Donaghy, Leon Jean Marie and Belle.
- Pete Kirtley – Ivor Novello winning pop songwriter who has just enjoyed a huge number 1 hit in Germany with the winners of German PopStars Monrose. The single has been one of the fastest selling ringtones in Germany selling 1.5 million ringtones. Pete had three songs on their number 1 album as well. Pete is currently working with new artist Sarah Jane Davis.

The ZMPL catalogue contains hit songs recorded by many leading contemporary artists:

- Britney Spears - “Hit me baby one more time” – chart #1 in countries including Belgium, Finland, France, Germany, Italy, the Netherlands, Norway and Spain;
- Britney Spears - “Oops I did it again” - #1 in Italy, the Netherlands, Norway and Sweden and top ten in Austria, Belgium, Finland, France and Germany.
- Bryan Adams - “Everything I do...” - #1 in Germany, the Netherlands, Belgium, Austria, Finland, Sweden, Denmark and Norway, amongst other countries.
- Backstreet Boys “I want it that way”, #1 in Portugal, Sweden, Ireland, the Netherlands, Norway, Greece, Austria, Belgium, Finland, Italy, Denmark and Latvia.

- Celine Dion – “That’s the way it is” #1 in Austria, Belgium, Denmark, Finland, France, Ireland, Italy, Latvia, the Netherlands, Norway, Poland, Spain and Sweden.
- Kelly Clarkson “Since You’ve been gone” #1 in the Netherlands, Ireland, Germany and UK.

This list is by no means exhaustive, but gives a flavour of the international success of the songs included in ZMPL’s catalogue.

The following table provides a summary of the financial information over the past three years:

SUMMARY	2004	2005	2006
EEA Revenue (€‘000)	[5,000 - 10,000]	[5,000 - 10,000]	[5,000 - 10,000]
Global Revenue (€‘000) ¹⁵²	[10,000 - 20-000]	[10,000 - 20-000]	[10,000 - 20-000]

¹⁵² See paragraph 4(a) of these Commitments.

1 Following paragraph 4 of these Commitments, the Divestment Businesses include, but are not limited to:

(a) the following main intangible assets:

Mike Chapman Publishing Enterprise	[Business Secret]

(c) It is not anticipated that it would be necessary for arrangements to be put in place for the supply of any necessary services for a transitional period, but UMG or affiliated undertakings would be prepared to agree to supply any such services on arm's length terms, if required by the Commission at the request of the Purchaser, for a reasonable transitional period.

2 The following personnel are currently employed by BMG MP but are dedicated to the ZMPL business:

- (a) **[Business Secret]** (General Manager);
- (b) **[Business Secret]** (A&R Manager); and
- (c) **[Business Secret]** (A&R Manager)

The Notifying Party undertakes to take all reasonable steps and to offer all reasonable incentives to assist in procuring the transfer of these personnel to the Purchaser in the event that the Purchaser wishes to employ these personnel following Closing.

- 3 The Divestment Businesses shall not include the Zomba name. The Zomba name is owned by the SONY BMG record company which uses it in connection with its Zomba record label. The trade name is currently licensed to BMG MP under transitional arrangements, put in place at the time of the creation of the SONY BMG joint venture in 2004 (and which are due to expire in **[Business Secret]**).
- 4 The Divestment Businesses shall not include Strongsongs Limited, a wholly owned subsidiary of ZMPL.
- 5 The Divestment Businesses shall not include ZMPL's production music business.

SCHEDULE 3 – Zomba US

Summary

Zomba US is the popular music publishing business of Zomba Enterprises Inc. (“ZEI”), which is a single corporate entity operating with several divisions: Zomba Songs (BMI) and Zomba Melodies (SESAC), which themselves are divisions of ZEI (ASCAP) (“Zomba US”). On or before the Effective Date, Zomba US shall procure the grant to ZMPL, or a newly incorporated corporate entity formed for the purpose of the divestment (the “Newco”), of licences of all popular music copyrights currently in existence for the EEA and those due to be delivered under existing agreements with Zomba US (the “Compositions”). The Purchaser(s) may elect to purchase either ZMPL together with the Compositions, or the Newco containing the Compositions.

Zomba US produced revenues in 2005 in the EEA of **€5 - 10 million**. In 2006 these increased to **€5 - 10 million** in the EEA.

Asset Description

Zomba US operates as a boutique music publisher in the Pop, Rock, and Urban genres. Zomba US’s most notable songwriters include R. Kelly, Linkin Park, Britney Spears, and Justin Timberlake. Additionally, Brentwood-Benson Music Publishing, Bridge Building (BMI), New Spring (ASCAP), and Designer Music (SESAC) are all divisions of ZEI and operate in the Contemporary Christian business. Brentwood-Benson has co-publishing ventures with two of the top Indie labels in this genre, SRE and 7Spin as well as artist Aaron Shust. In addition to the successes of ZMPL signed authors, Zomba US had early success from the growing hip hop scene in which it had a particularly strong position. Ground breaking artists were signed including Whodini, A Tribe Called Quest, featuring the rap group Q-Tip, and a young R&B group called R. Kelly and The Public Announcement. R. Kelly has gone on to become one of the most prolific writer/producers in the last three decades.

The Zomba US catalogue includes acclaimed songwriters, composers and producers including Britney Spears, Justin Timberlake, Linkin Park and Backstreet Boys. Zomba US is also home to an old-school Rap catalogue of hits from KRS-ONE, DJ Jazzy Jeff and the Fresh Prince, Teddy Riley (who has co-written with Michael Jackson); rock and metal hits from Poison and Twisted Sister. Zomba US has recently signed new hit acts in all genres of music including Ne-Yo and T-Pain.

Zomba US has an impressive array of current authors with ongoing delivery commitments.

These authors will continue to contribute valuable songs to the Purchaser. Authors within term, with ongoing obligations include:

- Linkin Park - multi-platinum rock act whose hits include “Breaking The Habit”, which reached the UK charts in 2004, and also charted in Austria, Germany, Ireland, France and the Netherlands; “Crawling”; “One Step Closer”; “Somewhere I Belong”, which charted in 2003 in the UK, Austria, Germany, Belgium, France, Sweden, Norway, Finland and the Netherlands; “Numb” - which was released by Linkin Park as a single in 2003, and reached the charts in the UK, Germany, Belgium, Ireland, Sweden and France; and Numb/Encore, which was a “mash-up” of the original single “Numb” and another original song “Encore” by the rapper Jay-Z song – this was a Grammy award winning song, which charted in the UK, Austria, Belgium, Germany, Ireland, France, Sweden, Norway and the Netherlands. Their first album “Hybrid Theory” has sold 24 million copies since 2000 and their second album “Metora” topped the charts in both the US and the UK. Albums consistently sell four-five million units each. The band’s next album will be released on April 3.

- R. Kelly – one of the most successful R&B/Urban artists of all time. He has had 13 number 1's including "You remind me of something" and "I believe I can fly" (for which he won 3 Grammy Awards in 1998), and has sold over 50 million albums worldwide. He has written/produced number one hits for himself including "Bump N Grind" and "Ignition" which hit number 1 in the UK in 2003, and the top 10 "Down Low" and "I Wish". He has also written songs for other artists such as Michael Jackson's "You Are Not Alone" and B2K "Bump, Bump, Bump". Chart hits in the past three years include "Playa's Only" which hit the UK charts in 2005, as well as charts in Germany, Ireland and France; "So Sexy", which reached the charts in the UK in 2004, "Happy People/U Saved Me" which charted in the UK, Germany and Ireland in 2004; "Step In The Name Of Love/Thoia Thong" which reached number 14 in the UK charts in 2003; and "Snake" which peaked at number 10 in the UK charts, and also charted in Ireland.
- Justin Timberlake - former member of massively successful boy band NSYNC (which holds the record for the highest and the second highest first week album sales) Justin has had an equally successful solo career since 2002, has won 4 Grammy Awards and released 2 solo albums producing over 12 million sales worldwide. Justin has had chart hits such as "Sexyback," which reached number 1 in the UK, Germany, Ireland and Norway in 2006, as well as charting in Austria (number 5), Belgium (number 3), France (number 8), Sweden (number 4), Finland (number 3) and the Netherlands (number 5); "What Goes Around"; "My Love", which reached number 2 in the UK, and also charted in Austria, Germany, Belgium, Ireland, France, Sweden, Finland and the Netherlands; "Cry Me A

River”, which reached number 2 in the UK in 2003, and also charted in Austria, Germany, Belgium, Ireland, France, Sweden, and the Netherlands; and “Like I Like You” which charted in 2003 in the UK, Germany, Ireland, Sweden, Norway, the Netherlands and Spain. Justin’s current album *FutureSex/LoveSounds* has sold over five million copies worldwide since its release in late 2006. Justin is also a co-writer on a number of other artists’ works, including one of the biggest worldwide hits of 2003, “Where Is The Love”, recorded by the Black Eyed Peas (and in which Justin Timberlake is featured in recording the chorus), reached number 1 in the UK, Austria, Germany, Belgium, Ireland, Sweden, Norway and the Netherlands. He wrote/produced current top 30 U.S. singles for Young Jeezy (“Go Getta”) and Bow Wow (“I’m A Flirt”).

- Britney Spears - has sold over 76 million records worldwide, making her the eighth best-selling female artist in American history. She has won a Grammy award and had 7 of her singles reach number 1 in the World Charts. Britney is also the only female in music history to have her first 4 studio albums debut at number 1. Hits include “Baby One More Time”, “Oops!.. I Did It Again”, “I’m A Slave 4 U” and “Me Against The Music.” Recent chart successes in the UK include “My Prerogative” which peaked at number 3 in 2004 in the UK, and charted in Austria, Germany, Belgium, Ireland (number 1), France, Sweden, Norway (number 1), and Finland; and “Me Against the Music”, which peaked in the UK at number 2 in 2003, and which also charted in Austria, Germany, Belgium, Ireland (number 1), France, Sweden, Norway, and Finland.

- Shania Twain - pop/country superstar whose hits – most co-written by Mutt Lange whose catalogue is published by ZMPL – include the number one and top 10 hits “You’re Still The One,” “Man! I Feel Like A Woman,” “From This Moment On” and “That Don’t Impress Me Much”.
- Ne-Yo - R&B/pop artist whose top hits include “So Sick”, which reached number 5 in the UK charts in 2006, and also charted in Germany, Ireland, France and the Netherlands; and “Sexy Love”, which reached number 1 in the UK in 2006, and also charted in Austria, Germany, Belgium, Ireland, France, Norway and the Netherlands. Ne-YO is also a sought-after writer/producer for other artists including number one hits for Beyonce “Irreplaceable”, which reached number 4 in the UK charts, and also charted in Austria, Germany, Belgium, Ireland, France, Sweden and the Netherlands; Mario “Let Me Love You”, which reached number 2 in the UK in 2005, and number 1 in Germany and Sweden; Rihanna “Unfaithful”, which reached number 2 in the UK, Austria, Germany, Ireland and Norway ; as well as Whitney Houston and Enrique Iglesias. Ne-Yo’s first debut album “In my own words” reached number 1 on the Billboard 200 in 2006, in the same week as his second single from that album “So Sick” reached number 1 in the Billboard Hot 100.
- Korn - multiplatinum rock group whose hits include “Freak On A Leash” and “Falling Away From Me”. Korn have sold over 30 million records worldwide, have had two number 1 albums in the US and have won 2 Grammys. Recent hits in Europe include “Coming Undone”, which charted in the UK in 2006, Germany and Ireland; “Twisted Transistor”, which charted in 2005 in the UK, Austria, Germany and Ireland; and “Did My

Time”, which charted in 2003, in the UK, Austria, Germany, Ireland and Sweden.

- Limp Bizkit - rock/rap multiplatinum group fronted by Fred Durst, Limp Bizkit have sold over 30 million albums worldwide, two of which reached number 1 in the US. Hits include “Nookie,” “Rollin’” and “My Generation”, Recent singles chart successes also include “Eat You Alive”, which reached the UK chart in 2003, and also charted in Austria, Germany, Ireland and Sweden.
- Bowling For Soup - punky power pop group whose songs include “1985” and “Girl All The Bad Guys Want”, and UK chart hits “Almost” from 2005, and “Punk Rock 101” from 2003.
- Macy Gray - R&B/soul singer whose hits include “I Try.”, and “When I See You” (UK chart hit in 2003) and who is due to release a new album in 2007.
- Nas - rap pioneer whose most recent album *Hip Hop Is Dead* debuted at number one on the U.S chart. Hits include “I Can”, “If I Ruled The World” and “Hate Me Now”, while UK chart successes include “Bridging the Gap” (2004), “I Can”, and “Made You Look” (2003).
- 30 Seconds to Mars - platinum rock group fronted by Jared Leto. Their recent single “The Kill” spent over 50 weeks on the rock singles chart.
- Donald Lawrence - award-winning Gospel singer and writer/producer who has also crossed over into the pop world.

- Backstreet Boys - leading boy band pop group of the late 1990s whose hits include “Tearin’ Up My Heart,” “As Long As You Love Me,” “I Want It That Way” and “Incomplete.”
- Mike Shonoda is a member of bands Linkin Park and Fort Minor. Fort Minor won Ringtone of the Year for “Where’d You Go” at the MTV VMA’s in 2006 and their debut album has sold over 350,000 copies.
- Andrae Crouch - leading Gospel artist over the past three decades. Key titles include “He Is The Light,” “God Still Loves Me” and “Mercy.” Crouch has collaborated with important artists including Ce Ce Winans and Michael Omartian.
- Writer/producers include KNS (who has written for Kylie Minogue and songs in the movie *Happy Feet*), Ron ‘Neff-U’ Feemster (Ne-Yo, 50 Cent, The Game), Cool & Dre (50 Cent, The Game), Beau Dozier (Joss Stone, Avant, JoJo) and Steve Huff (Avant, Ron Isley, Joe).
- Development rock acts include Mutemath, Flyleaf, Saliva and The Crew.
 - Mudvayne Music – winners of the MTV2 Award for their single “Dig” in 2001 and their single “Happy?” was number 1 in the US Mainstream Rock Chart for one week in 2005. Mudvayne have been nominated for 3 Grammys.
 - Eamon Doyle - Eamon’s debut single “Fuck It (I don’t want you back)” reached number 1 in the UK, Australia, New Zealand, The Netherlands and Sweden, with his debut album “I Don’t Want You Back” making the Top 10 in the Billboard 200.

- Other authors still in term include Petey Pablo (who has recorded 3 albums and 9 singles, and featured on Ciara’s number 1 single “Goodies”), Lawrence Parker, Poison (have had 3 top 5 albums in the US), and Jolyon Skinner, and Andrew Gold (best known for his singles “Lonely Boy” (Top 10) and “Thank you for Being a Friend”).

The current authors listed above have generated an immense and impressive catalogue, as many have been signed to Zomba US for **[Business Secret]** or even over **[Business Secret]** years, and Zomba US holds music publishing rights for the life of copyright over the vast majority of these works.

Even on top of this catalogue from current writers, there is additionally a large back catalogue of important works by the following authors:

- Teddy Riley - a producer and artist of early hip-hop and “New Jack Swing” including Joe’s “Stutter” and Blackstreet’s “No Diggity,” which both reached number one on the pop and R&B charts. He has also written/produced songs for Mary J. Blige, Keith Sweat, Johnny Kemp, Michael Jackson and Al B. Sure. Works from 1992 to 2004 are covered in the Zomba US catalogue.
- Buddy Guy a blues legend whose 1960s classics include “Let Me Love You Baby,” “Ten Years Ago,” “Stone Crazy,” “My Time After A While,” “Leave My Girl Alone” and “No Lie.”
- Cowboy Junkies the rock band whose sound is rooted in country and blues. Hits include “Misguided Angel”.

- DJ Jazzy Jeff & The Fresh Prince, Will Smith’s rap duo with DJ Jazzy Jeff. Hits include top 5 “Summertime,” top 20 “Parents Just Don’t Understand” and “Girls Ain’t Nothing But Trouble”.
- Digital Underground the funky rap group whose hits include “The Humpty Dance”.
- Full Force with major hits for Lisa Lisa and Cult Jam including “Head To Toe,” “Lost In Emotion,” “All Cried Out” and “I Wonder If I Take You Home,” which was sampled on the 2005 Black Eyed Peas top five hit “Don’t Phunk With My Heart”.
- Forceful Music And Mokojumbi Music (Full Force). Full Force have written and produced songs for Britney Spears, James Brown, Cult Jam, Backstreet Boys and La Toya Jackson. They also produced Rihanna’s hit “Let Me” and the Black Eyes Peas hit “Don’t Phunk with my Heart”, which reached number 3 in the UK, and charted in Austria, Belgium, Germany, Ireland, France, Sweden and Norway (number 1).

The following table provides a summary of the financial information for the Zomba US catalogue over the past three years:

SUMMARY	2004	2005	2006
EEA Rev (€’000)	[5,000 - 10,000]	[5,000 - 10,000]	[5,000 - 10,000]

1 Following paragraph 4 of these Commitments, the Divestment Businesses include, but are not limited to:

(a) the following main intangible assets:

The main assets are the music publishing rights of varying duration. The following table shows the top 100 copyrights in the Zomba US catalogue for 2006.

KORN	[Business Secret]
RILEY, TEDDY	[Business Secret]
FORCEFUL MUSIC AND MOKOJUMBI MUSIC	[Business Secret]
FEEMSTER, THERON PKA RON FEEMSTER	[Business Secret]

The Compositions shall be licensed on the following terms:

- (i) the territory of the Licence will be the EEA (the "Territory");
- (ii) the term of the Licence will be for the entire period of the rights Zomba US has for the Compositions in the Territory;
- (iii) the financial and other terms will be those negotiated at arm's length with the purchaser of ZMPL or Newco, as the case may be. However, Compositions existing at the Effective Date shall be licensed on a royalty-free basis (although the financial benefit to the purchaser of ZMPL (or, Newco, as the case may be) shall be reflected in the purchase price), subject to the purchaser being responsible to Zomba US for all royalty payments due to writers in respect of the Compositions. All Compositions due to be delivered in the future under existing agreements with Zomba US and those to be delivered following the exercise of any options provided for under those existing agreements shall be the subject of a separate royalty payment from the purchaser of ZMPL (or Newco, as the case may be) to Zomba US, to be agreed on arm's length commercial terms, which shall include royalty payments due to writers in respect of those compositions; and
- (iv) there will be no restrictions on exploitation of the Compositions by the Purchaser except for those contained in Zomba US' song-writer, administration and sub-publishing agreements with its writers and licensors.

- (c) It is not anticipated that it would be necessary for arrangements to be put in place for the supply of any necessary services for a transitional period, but UMG or affiliated undertakings would be prepared to agree to supply any such services on arm's length terms, if required by the Commission at the request of the Purchaser, for a reasonable transitional period.
- 3 The Divestment Businesses shall not include the Zomba name. The Zomba name is owned by the SONY BMG record company which uses it in connection with its Zomba record label. The trade name is currently licensed to BMG MP under transitional arrangements, put in place at the time of the creation of the SONY BMG joint venture in 2004 (and which are due to expire in **[Business Secret]**).
- 4 The Divestment Businesses shall not include ZEI's production music business.

SCHEDULE 4 – 19 Music Limited

Summary

19 Music Limited (“19 Music”) is a separate legal entity within BMG Music Publishing. In 2005, 19 Music’s total EEA revenues were **€(< 1 million]** and global revenues were **€(< 1 million]**.

The 19 Music catalogue is one of the most important UK-based pop catalogues in the last ten years. It comprises chart hits which continue to generate high revenues, such as songs from: Culture Club (including “Karma Chameleon”), Spice Girls (“Who do you think you are?”), B*Witched, S Club 7, Emma Bunton (Baby Spice) and Geri Halliwell (Ginger Spice). It also includes repertoire for reality television programmes, e.g. the Pop Idol repertoire.

The 19 Music and 19 Songs (see Schedule 5 below) catalogues include repertoire from the Spice Girls which charted as number 1 in many countries in Europe as well as from other authors which have featured in charts in both UK and continental European countries for a number of weeks, such as S Club 7, B*Witched, Boyzone and successful acts arising from reality TV shows around the EEA. Specific chart hits include:

- Spice Girls – Spiceworld - chart position # 1, sold over 10 million worldwide
- Stop (Absolute 50%) - chart position #2
- Too Much (Absolute 50%) – chart position #1
- Spice Girls – Spice - chart position # 1, sold 3 million worldwide
- Who Do You Think You Are (Absolute 50%) - chart position #1
- Boyzone – Said and Done - chart position UK #1, 900K worldwide
- Key To My Life (Ray Hedges 25%) - chart position #3
- Coming Home Now (Ray Hedges 25%) - chart position #4
- Boyzone – A Different Beat - chart position UK #1, 900K worldwide
- A Different Beat (Ray Hedges 20%) - chart position #1
- Isn't It A Wonder (Ray Hedges 33.33%) – chart position #2
- Will Young – From Now On – chart position UK # 1, sold 600K UK
- You And I (Johnsons 50%/ Peden 50%) – chart position #2
- S Club 7 – 7 - chart position UK # 1, sold 900K UK
- Never Had A Dream Come True (Simon Ellis 50%) – Chart Position # 1

- S Club 7 – S Club - chart position UK # 2, sold 600K UK
- Bring It All Back (Steelworks 53.32%) – chart position # 1
- Two In A Million (Simon Ellis 50%) – chart position # 2
- S Club 7 – Sunshine - chart position UK # 3, sold 600K UK
- You (Steelworks 50%) – chart position # 2
- Don't Stop Movin (Simon Ellis 50%)' – chart position # 1
- S Club 7 – Seeing Double - chart position UK # 17, sold 600K UK
- Love Ain't Gonna Wait For You (Simon Ellis 50%) – chart position # 2
- Alive (Simon Ellis 50%) – chart position # 5
- S Club Juniors – Together – chart position UK # 5, sold 600K UK
- Automatic High (Jewels & Stone 25%) - chart position #2
- B*Witched – B*Witched – chart position UK #3 / US #12, 600K UK
- C'est La Vie (Ray Hedges 27%) – chart position #1 / US #9
- Rollercoaster (Ray Hedges 28.33%) – chart position #1
- To You I Belong (Ray Hedges 33.33%) - chart position #1
- Blame It On The Weatherman (Ray Hedges 25%) – chart position #1
- B*Witched – Awake and Breathe – chart position #5, 300K UK
- Jesse Hold On (Ray Hedges 25%) – chart position# 4
- Billie Piper – Walk of Life - chart position # 14, sold 60K worldwide
- Day And Night (Steelworks 40%) - chart position #1

The following table provides a summary of the financial information over the past three years:

(c) It is not anticipated that it would be necessary for arrangements to be put in place for the supply of any necessary services for a transitional period on arm's length terms, but UMG or affiliated undertakings would be prepared to agree to supply any such services, if required by the Commission at the request of the Purchaser, for a reasonable transitional period.

SCHEDULE 5 – 19 Songs Limited

Summary

19 Songs Limited (“19 Songs”) is joint venture in which BMG Music Publishing holds 50% shares, the remaining 50% being held by Simon Fuller (a record and television producer). In 2005, 19 Songs’ total EEA revenues were €[< 1 million] and global revenues were €[< 1 million].

The 19 Songs catalogue consists of pop music linked to television reality shows. Indeed, the catalogue’s song generating the largest revenues of 19 Songs is the American Idol theme. It also includes other pop repertoire, for instance from: Emma Bunton, S Club 7 and Lisa Scott Lee (Steps).

The following table provides a summary of the financial information over the past three years:

SUMMARY	2004	2005	2006
EEA Rev (€’000)	[< 1,000]	[< 1,000]	[< 1,000]
Global Revenue (€’000)	[< 1,000]	[< 1,000]	[< 1,000]

undertakings would be prepared to agree to supply any such services, if required by the Commission at the request of the Purchaser, for a reasonable transitional period.

SCHEDULE 6 – BMG MP’s BBC music publishing catalogue

Summary

The BBC music publishing catalogue consists of music publishing copyrights acquired from BBC Worldwide Limited in 2005. Assignment of these rights is subject to consent of BBC Worldwide Limited.

In addition, the BBC’s contracts with the writers of these works are likely to require author consent to assignment. Following the acquisition of the BBC catalogue by BMG MP, the BBC procured that writers entered into direct novations with BMG MP or the BBC continued to hold the catalogue as trustee for BMG MP acting under BMG MP’s direction, so that following the acquisition, the full benefit of all contractual rights vested in BMG MP. Similar arrangements could be put in place with the Purchaser. In 2005, total revenues originated by the BBC music publishing catalogue (virtually all in the EEA) were **€[1 - 5 million]**.

The BBC music publishing catalogue consists mainly of copyrights in television themes, broadcast in the UK and globally (which in some cases have obtained commercial success in the charts, e.g. Bob the Builder’s “Can we fix it?” and Teletubbies’ “Say eh-oh!”).

The following table provides a summary of the financial information over the past three years:

SUMMARY	2004	2005	2006
EEA Rev (€‘000)	[1,000 - 5,000]	[1,000 - 5,000]	[1,000 - 5,000]
Global Revenue (€‘000)	[1,000 - 5,000]	[1,000 - 5,000]	[1,000 - 5,000]

SCHEDULE 7 – Rondor Music (London) Limited (“Rondor UK”)

Summary

Rondor UK is a pure pop catalogue which produced revenues in 2005 in the EEA of **€5 - 10 million]** and **€5 - 10 million]** globally. In 2006 these have increased dramatically to **€5 - 10 million]** in the EEA and **€10 - 15 million]** globally.

Of particular note is the depth of this catalogue, which includes over **[Business Secret]** writers which generated more than **€5,000** globally in 2006. Current writers include:

- The Kaiser Chiefs arrived on the UK music scene in 2005 following the release of their debut album ‘Employment’. This album went to number 2 in the UK, has sold 2.5 million copies worldwide to date and was the fourth biggest UK album of 2005, with four hit singles “(Everyday I Love You Less And Less”, which reached number 10 in the UK, “I Predict A Riot/Sink That Ship”, which reached number 9 in the UK, “Modern Way”, which reached number 11 in the UK, and “Oh My God” which reached number 6 in the UK). The band has gone on to win three Brit Awards in 2006, Britain’s most prestigious music awards (Best British Rock Act, Best British Live Act, Best British Group), and a prestigious Ivor Novello award (the top UK song-writing award) in 2006, as well as an NME Award for Best Album in 2006. The follow up album ‘Yours Truly, Angry Mob’ was released in March 2007 and has already reached number 1 in the UK, number 1 in Greece, number 1 in the Netherlands, number 2 in Ireland, number 4 in Austria and number 6 in Germany. It achieved platinum status in the UK (300,000 sales) within two weeks of release, and 540,000 total shipments globally by 24 March 2007. Sales of this album are anticipated to at least match sales of the first album. The single ‘Ruby’ reached number 1 in the UK charts in February 2007, and was number 1 in the European

singles charts. Gross income earned to date, over a period of just over one and half years, is in excess of €[Business Secret]. [Business Secret].

- Sophie Ellis Bextor was originally in a band called 'theaudience' but found fame singing and co-writing the worldwide hit 'Groovejet (If This Ain't Love)' by Spiller which was a number 1 single around the world including the UK where it sold 600,000 copies. Following this Sophie has pursued a successful solo career with album sales to date of 1.5 million copies and her debut album 'Read My Lips' entering the UK charts at number 2 in 2002. She has had 7 top 20 singles with 'Take Me Home' and 'Murder On The Dancefloor' reaching no 2 in 2001. The latter also topped the European Airplay Charts. In 2003 the single 'Mixed Up World' reached number 7 in the UK charts, and in 2004 'I Won't Change You' reached number 9 in the UK. Sophie's third album 'Trip the Light Fantastic' is due for release in May 2007, and the first single from this album 'Catch You' has already reached number 8 in the UK charts.
- Jorgen / Larsson - Danish pop production team whose credits include the boy band Blue who had several hits throughout Europe, including 'Breathe Easy' which reached number 4 in the UK and Ireland, and number 7 in Austria and Germany in April/May 2004.
- Other writers with ongoing delivery commitments include Aston Harvey and Jan Kask.

Key works in the catalogue include copyrights by top authors such as the following:

- Mark Knopfler - the songwriter and lead singer of Dire Straits, their biggest album 'Brothers in Arms' has sold in excess of 25 million copies, spent nine weeks at number 1 in the US and is the UK's fourth biggest selling album of all time. The

catalogue includes the Sting co-written song 'Money For Nothing' and other chart hits such as 'Walk Of Life', and 'Private Investigations'. Dire Straits have won numerous accolades and awards including two Grammys and three Brit Awards. To date, Mark Knopfler has sold over 60 million albums including approximately 10 million albums as a solo artist. Gross income earned to date is in excess of ~~€~~**[Business Secret]**.

- Wayne Hector - co-written work includes Westlife songs such as 'Flying Without Wings' which was a UK number 1 in 1999 and the UK Song of the Year. 'Flying Without Wings' was also covered in 2003 by American Idol contestant Ruben Studdard; this cover version entered at number 2 in the Billboard Hot 100 chart and had sold 751,000 copies by December 2006. Wayne also wrote the Westlife hits 'Swear it Again' (number 1 in the UK and Ireland in 1999), 'What Makes a Man' (number 2 in the UK in 2000) and 'Queen of My Heart' (number 1 in the UK and number 14 In Ireland in 2001). Wayne co-wrote songs for Westlife which appeared on their chart topping greatest hits album, released in 2002. Wayne has also written for a number of the American Idol contestants, and has also co-written a number 1 country hit in the US in 2006 with 'What Hurts The Most', recorded by the Rascal Flatts.
- Steve Robson - Steve has written for numerous artists including S-Club 7 and had a number 1 country hit in the US in 2006 with 'What Hurts The Most', recorded by the Rascal Flatts, which featured on the number 2 selling album in the US in 2006, also by the Rascal Flatts.
- Leo Sayer catalogue, which includes the song 'Thunder in My Heart' which originally reached #22 in the UK charts in September 1977 but was remixed by MECK as 'Thunder in My Heart Again' and reached #1 in the UK charts in

February 2006 and number 7 in the Dutch charts. The catalogue contains chart toppers from across the globe from the 1970's and 1980's, including 'You Make Me Feel Like Dancing'.

- Imogen Heap – this singer-songwriter has had significant recent chart success, with her recent single 'Hide and Seek', which reached the charts in 2006, 'Goodnight and Go' which reached the UK charts in 2006, and 'Headlock' which also reached the UK charts in 2006. So far she has released two solo albums 'Megaphone' and 'Speak for Yourself', as well as writing songs for her band Frou Frou. Imogen Heap was nominated for a Grammy for Best New Artist and for Best Song Written For A Motion Picture "Narnia" in December 2006.
- William Orbit – this writer producer, who is also an artist in his own right, co-wrote six works recorded by Madonna on her 1998 album 'Ray of Light', which sold 15 million copies worldwide, including the hit singles 'Ray Of Light' and 'Drowned World/Substitute For Love'. William also co-wrote 'Pure Shores' with Shaznay Lewis which achieved number 1 in the UK charts in 2000, as well as being the top selling single of that year with sales of 683,000. Orbit won a prestigious Ivor Novello award (the top UK song-writing award) for this song in 2001.
- Nick Kershaw – this singer-songwriter achieved success in the mid-1980's with the chart hits 'The Riddle', 'I Won't Let The Sun Go Down On Me', and 'Wouldn't It Be Good', and wrote 'The One and Only' which was a number one single in the UK for Chesney Hawkes in 1991.
- Hammond and Hazelwood – this 1970's songwriting team wrote the evergreen hits such as 'It Never Rains in Southern California' recorded by Albert Hammond which was a number 5 chart hit in the US in 1972 and 'The Air That I Breathe', recorded

by the Hollies, which was a number 2 hit in the UK in 1974, which was released on 136 different products including well known covers by Julio Iglesias, Olivia Newton John, Simply Red, and kd lang in 1997.

- Brenda Richie – this catalogue includes songs recorded by Lionel Richie (winner of 3 Grammy awards) such as ‘Hello’ reached number 1 in the UK, ‘All Night Long’ number 1 in the US, ‘Dancing On The Ceiling’ number 6 in the UK, and ‘Stuck On You’ was from the number 1 album in 1983 in the UK ‘Cant Slow Down’.
- Joan Armatrading – Joan achieved success in the 1970’s with the hits ‘Love And Affection’, which appeared on the album ‘Joan Armatrading’ released in 1976, along with other songs such as ‘The Weakness In Me’, ‘Show Some Emotion’ and ‘Me Myself and I’.
- Other key copyrights include Chris de Burgh’s ‘Lady In Red’ number 1 in 25 countries, worldwide sales of 8 million – which has been released on 201 different products, and Andy Fairweather Low’s ‘Wide Eyed And Legless’ - a number 6 hit in the UK.

The following table provides a summary of the financial information over the past three years:

SUMMARY	2004	2005	2006
EEA Rev (€‘000)	[5,000 - 10,000]	[5,000 - 10,000]	[5,000 - 10,000]
Global Revenue (€‘000)	[5,000 - 10,000]	[5,000 - 10,000]	[5,000 - 10,000] ¹⁵⁶

1 Following paragraph 4 of these Commitments, the Divestment Businesses include, but are not limited to:

(a) the following main intangible assets:

¹⁵⁶ These revenues exclude the three bands Supertramp, Squeeze and Yes, which has the effect of reducing global revenues in 2006 by €[Business Secret].

The main assets are the music publishing rights of varying duration.

The following table shows the top 100 copyrights in the Rondor UK catalogue for 2006.

- (c) It is not anticipated that it would be necessary for arrangements to be put in place for the supply of any necessary services for a transitional period on arm's length terms, but UMG or affiliated undertakings would be prepared to agree to supply any such services, if required by the Commission at the request of the Purchaser, for a reasonable transitional period.

2 The Divestment Businesses shall not include:

- (a) The Rondor name.
- (b) The works of the three bands: Supertramp, Squeeze and Yes.

EUROPEAN COMMISSION

Competition DG

Policy and Strategic Support

OPINION

of the ADVISORY COMMITTEE on CONCENTRATIONS

given at its 150th meeting on 10 May 2007

concerning a draft decision relating to

Case COMP/M.4404– Universal Music Group/BMG Music Publishing

1. The Advisory Committee agrees with the Commission that the notified operation constitutes a concentration within the meaning of Article 3(1)(b) of the EC Merger Regulation and that it has a Community dimension pursuant to Article 1(3) of that Regulation.
2. The Advisory Committee agrees with the Commission that the relevant product markets can be characterised as follows:
 - a) Markets for the exploitation of music publishing rights
The relevant product markets need to be defined along the following categories of rights since the customer needs, the prices as well as the overall economic conditions differ significantly:
 - Mechanical rights;
 - Performance rights;
 - Synchronisation rights;
 - Print rights;
 - Online rights.
 - b) Market for music publishing services to authors.
3. The Advisory Committee agrees with the Commission that the geographic scope of the relevant product markets is:
 - a) Markets for the exploitation of music publishing rights
 - mechanical and performance rights: national;
 - print and synchronisation rights: largely national;
 - online rights: currently national, but it is possible that it will develop to an EEA-wide scope. However, there is no need to strictly define the geographic scope of the market for online rights as the competitive assessment will remain unchanged under a national or EEA wide dimension.

b) Market for music publishing services to authors

- The geographic scope of the market appears to be national. The exact geographic scope may, however, be left open since the conclusions of the analysis will be the same under any geographic dimension.
4. The Advisory Committee agrees with the Commission that the proposed concentration will not significantly impede effective competition on the market for music publishing services for authors.
 5. The Advisory Committee agrees with the Commission that the proposed concentration will not significantly impede effective competition on the market for the exploitation of synchronisation rights, on the market for the exploitation of print rights, on the market for the exploitation of mechanical rights and on the market for the exploitation of performance rights.
 6. The Advisory Committee agrees with the Commission's view that it is very likely that Universal will post-merger, on the basis of non-coordinated effects, have the possibility and the incentive to increase prices for its repertoire of Anglo-American mechanical rights for online applications. The Advisory Committee agrees that the merger therefore raises serious doubts with respect to the market for online rights (which are composed of mechanical and performance rights for online applications) both on an EEA-wide level and in the countries Austria, the Czech Republic, Germany, Poland and the UK.
 7. The Advisory Committee agrees with the Commission that the Final Remedies Package submitted on 23 April 2007 which comprises the following catalogues and contracts:
 - a) BMG MP catalogues
 - Zomba Music Publishers Limited
 - 19 Music Limited
 - 19 Songs Limited
 - BBC music publishing catalogue
 - Zomba U.S. (EEA-wide licence)
 - b) Universal catalogues
 - Rondor Music (London) Limited

is sufficient to remove the competition concerns on the market for publishing rights for online applications, both under an EEA-wide or national geographic market definition.

8. The Advisory Committee agrees with the Commission that, the proposed concentration as modified by the Commitments does not significantly impede effective competition in the common market or a substantial part of it, in particular as a result of the creation or strengthening of a dominant position, and that pursuant to Articles 8 (2) and 10 (2) of the Merger Regulation and Article 57 of the EEA Agreement the proposed concentration is therefore to be declared compatible with the Common Market and with the EEA Agreement, subject to full compliance with the commitments offered by the notifying party.

9. The Advisory Committee asks the Commission to take into account all the other points raised during the discussion.

EUROPEAN COMMISSION

The Hearing Officer

FINAL REPORT OF THE HEARING OFFICER
IN CASE COMP/M.4404 – Universal/BMG

**(pursuant to Articles 15 & 16 of Commission Decision (2001/462/EC, ECSC)
of 23 May 2001 on the terms of reference of Hearing Officers
in certain competition proceedings – OJ L162, 19.06.2001, p.21)**

On 3 November 2006, the Commission received a notification of a proposed concentration pursuant to Article 4 of Council Regulation (EC) No 139/2004 by which the undertaking Universal Music Group Inc. (“Universal”) acquires within the meaning of Article 3(1)(b) of the Council Regulation sole control of the whole of the undertaking BMG Music Publishing (“BMG”) which currently forms part of the Bertelsmann group, by way of purchase of shares and assets.

Upon examination of the evidence submitted by the parties to the proposed concentration and after conducting a market investigation, the Commission concluded that the concentration raised serious doubts as to its compatibility with the common market and decided to initiate proceedings under Article 6 (1) (c) of the Merger Regulation on 8 December 2006.

Access to key documents was provided to the notifying party on 21 December 2006 and again on 26 January 2007, in accordance with the best practices on the conduct of EC merger control proceedings.

On 15 March 2007 the parties offered commitments that modified the original concentration plan. These commitments were modified on 26 March and again on 30 March, and final commitments were submitted on 23 April 2007. On the basis of these undertakings the relevant Commission service considered that the serious doubts had been removed. Accordingly no Statement of objections was sent to the parties.

No queries were raised before me by the parties or other companies as to the market test.

The case does not call for any particular comments as regards the right to be heard.

Brussels, 11 May 2007

3 OJ 2010/C 16 p.8

4 OJ 2010/C 16 p.10

WHEREAS:

I. THE PARTIES AND THE TRANSACTION

- (1) On 8 May 2009, the Commission received a notification of a proposed concentration pursuant to Article 4 of Regulation (EC) No 139/2004 (hereinafter "the Merger Regulation"), by which the undertaking Deutsche Lufthansa AG (hereinafter "LH") acquires sole control, within the meaning of Article 3(1)(b) of that Regulation, of the undertaking Austrian Airlines (hereinafter "OS") by way of purchase of shares.
- (2) LH is the largest German airline. It provides scheduled passenger and cargo transport and related services (maintenance, repair and overhaul services ("MRO"), in-flight catering and IT services). In 2008, LH carried 45 million passengers to more than 200 destinations in 85 countries with its 272 aircraft. It has hubs at Frankfurt International Airport and Munich airport and a base at Düsseldorf airport. LH also controls Swiss International Air Lines Ltd. ("LX")⁵ based at Zurich airport, Air Dolomiti, Eurowings, and Eurowings' subsidiary, the low-cost carrier Germanwings ("4U"), and it recently acquired British Midland ("BMI") and Brussels Airlines ("SN").⁶ In addition, LH holds 19% of the shares of Jet Blue, a low-cost airline active in the United States of America. Both LH and LX are members of the Star Alliance.
- (3) OS is the Republic of Austria's largest airline with its principal hub in Vienna. It provides scheduled passenger and cargo transport and related services, and serves 121 destinations in 63 countries (including code-sharing). Its subsidiaries include Lauda Air and Tyrolean Airways. In addition, it holds a stake of 22.5% of the shares of Ukraine International Airlines, a Ukrainian network carrier. OS is a member of the Star Alliance.
- (4) LH intends to acquire sole control over OS. On 5 December 2008, in the context of the privatisation process of OS, LH agreed to indirectly acquire a 41.56% shareholding in OS from the publicly owned Österreichische Industrieholding Aktiengesellschaft ("ÖIAG"). In addition, on 27 February 2009, LH launched a public offer for all remaining free-floating shares in OS, for which it received more than the required amount of declarations of acceptance. Together with the shares it acquired from ÖIAG, LH will be able to acquire an at least 85% shareholding in OS.

5 See Commission Decision of 4 July 2005 in Case No. COMP/M.3770 - Lufthansa/Swiss, OJ C 240, 20.8.2005, p. 3.

6 The Commission authorized the proposed acquisition of SN by LH subject to conditions on 22 June 2009, see Case No. COMP/M.5335 – Lufthansa/SN Airholdings (Brussels Airlines), not yet published. The Commission approved the proposed acquisition of BMI by LH without conditions on 14 May 2009, see Commission Decision of 14 May 2009 in Case No. COMP/M.5403 - Lufthansa/BMI, OJ C 158, 11.7.2009, p. 1.

- (5) OS is currently encountering financial difficulties.⁷ In July 2008, OS's management considered that the stand-alone option was no longer maintainable, and its supervisory board concluded that it would be difficult to continue operating OS as a stand-alone business. Consequently, OS' supervisory board asked that Austria privatise the company and the Austrian Government issued a privatization mandate ("Privatisierungsauftrag") pursuant to which ÖIAG was authorised to dispose of all of its shares in Austrian Airlines. On 19 January 2009, the Commission approved rescue aid in the form of a 100% guarantee on a loan amounting to EUR 200 million for OS.⁸ In parallel to its assessment of the transaction under the Merger Regulation, the Commission assessed the terms and conditions of the intended acquisition of Austria's shareholding in OS by LH and a EUR 500 million capital increase in OS under Articles 87 and 88 of the Treaty.
- (6) Collectively, LH and OS are referred to as "the parties" in this Decision.

II. CONCENTRATION

- (7) As a result of the proposed transaction, LH would acquire sole control over OS. This transaction thus constitutes a concentration within the meaning of Article 3(1)(b) of the Merger Regulation.

III. COMMUNITY DIMENSION

- (8) The undertakings concerned have a combined aggregate world-wide turnover of more than EUR 5 billion (LH: EUR 27 870 million; OS: EUR 2 530 million).⁹ LH and OS both have a Community-wide turnover in excess of EUR 250 million each (LH: EUR [...]*; OS: EUR [...]*), but neither achieves more than two-thirds of its aggregate Community-wide turnover within one and the same Member State. The methodology used by the notifying party to calculate the parties' turnover is the "point of sale" methodology, although in any event the thresholds would also be met under the "point of origin" method or "50/50 split" method.¹⁰ The proposed transaction therefore has a Community dimension within the meaning of Article 1(2) of the Merger Regulation.

IV. PROCEDURE

- (9) After examination of the notification, the Commission concluded on 1 July 2009 that the transaction fell within the scope of the Merger Regulation and that it raised serious doubts as to its compatibility with the common market and the EEA Agreement, despite the

* Parts of this text have been edited to ensure that confidential information is not disclosed; those parts are enclosed in square brackets and marked with an asterisk.

7 In 2008, OS generated losses of EUR 430 million. According to OS' half-year 2009 financial report, the net result for the period January to June 2009 amounted to a loss of EUR 166.6 million.

8 Commission Decision of 19 January 2009 on State aid NN 72/2008, Austrian Airlines – Rescue aid.

9 Turnover calculated in accordance with Article 5(1) of the Merger Regulation.

10 These three methodologies are explained in Commission Decision of 27 June 2007 in Case No. COMP/M.4439 Ryanair/Aer Lingus, OJ C 47, 20.2.2008, p. 9-20, paragraph 13 et seq.

commitments submitted in phase 1. The Commission therefore initiated proceedings in accordance with Article 6(1)(c) of the Merger Regulation.

- (10) LH submitted commitments on 10 July 2009 pursuant to Article 8(2) of the Merger Regulation. On 17 July 2009 and 27 July 2009, LH submitted revised versions of the commitments. Following the submission of the revised version of the commitments on 27 July 2009, the Commission launched a market test in order to gather competitors', customers' and other market participants' views on these commitments. In light of the results of the market test, LH presented a final version of commitments on 31 July 2009 ("the Commitments"). According to Article 10(2) of the Merger Regulation, decisions pursuant to Article 8(2) of the Merger Regulation shall be taken as soon as it appears that any serious doubts referred to in Article 6(1)(c) of the Merger Regulation have been removed, particularly as a result of modifications made by the undertakings concerned. Accordingly, if parties offer commitments before the Commission has completed its in-depth investigation and issued a Statement of Objections, those commitments must be sufficient to rule out the existence of serious doubts.¹¹

V. RELEVANT PRODUCT AND GEOGRAPHIC MARKETS

A. Scheduled air transport of passengers

(1) *Point of origin/point of destination ("O&D") city pairs*

- (11) The Commission has in the past defined the relevant market for scheduled passenger air transport services on the basis of the "point of origin/point of destination" (hereinafter "O&D") city-pair approach.¹² This market definition reflects the demand-side perspective whereby customers consider all possible alternatives (including different modes of transport) of travelling from a city of origin to a city of destination. On this basis, every combination of a point of origin and a point of destination is considered to be a separate market.
- (12) More particularly, with regard to network carriers, the Commission has nevertheless taken into consideration supply-side elements such as network competition between airlines based on the hub and spoke structure of traditional carriers. Although from a supply-side perspective a network carrier could in theory fly from any point of origin to any point of destination, in practice network carriers build their network and decide to fly almost exclusively on routes connecting to their hubs. Similar considerations apply for airlines that focus on point-to-point services. From a demand-side perspective, the Commission has

11 Cf. the Commission notice on remedies acceptable under Council Regulation (EC) No 139/2004 and under Commission Regulation (EC) No 802/2004, OJ C 267, 22.10.2008, p. 1, point 18.

12 See Case No. COMP/M.5335 – Lufthansa/SN Airholding (Brussels Airlines), paragraph 12 et seq.; Commission Decision of 9 January 2009 in Case No. COMP/M.5364 – Iberia/Vueling/Clickair, OJ C 72, 26.3.2009, p. 23, paragraph 30; Commission Decision of 11 February 2004 in Case No. COMP/M.3280 – Air France/KLM, OJ C 60, 9.3.2004, p. 5, paragraph 9 et seq.; Case No. COMP/M.3770 – Lufthansa/Swiss, paragraph 12 et seq. The O&D approach was also confirmed by the European courts. See for instance CFI, Case T-177/04 easyJet v Commission, of 4 July 2006 ECR (2006), II-1913, at paragraph 56; or Case T-358/94 AirFrance v Commission, ECR (1996), II 2109.

previously considered that while networks have some importance for corporate customers whose demand is driven both by network effects and O&D considerations, individual customers are mainly concerned with finding the cheapest and most convenient connection between two cities.¹³

- (13) The market investigation has generally confirmed the O&D approach. However, some respondents, particularly traditional network carriers, indicated that the O&D approach fails to take into account the hub and spoke function of major airports and the ensuing network effects. It should also be noted that several carriers pointed out that both the point of origin and the point of destination should include all airports that are substitutable from the perspective of passengers. In the past, the Commission has considered that, in instances where multiple airports serve a single point of origin or destination, such airports may be included in the same relevant market, provided that they are indeed perceived as substitutable by travellers.¹⁴
- (14) Therefore, the effects of the proposed transaction will be assessed on the basis of various affected city-pair O&Ds while substitutable airports will be included in the respective points of origin and points of destination.

(2) *Flight substitutability from/to different airports*

- (15) Previous Commission Decisions have recognised that flights from or to airports which have overlapping catchment areas can be considered as substitutes.¹⁵ Such airport substitution has often been accepted where several airports are located in the same city;¹⁶ moreover, the Commission recently noted in the Ryanair/Aer Lingus Decision that secondary airports are likely to be *prima facie* in the same catchment area of a city if they are within 100 km or one hour of travel time of the city centre.¹⁷ However, the 100 km/one-hour criterion was viewed as only a first "proxy".¹⁸ Also, the 100 km/one-hour criterion was defined by the Commission in the specific case of routes served out of Dublin by two airlines with typical attributes of low-frills point-to-point carriers. This "rule" is thus not necessarily valid for other cases, such as routes served by two network carriers.¹⁹ Therefore, a more detailed analysis taking into consideration the characteristics of the case at hand rather than a specific proxy should be used to correctly capture the competitive constraint that flights from/to two different airports exert on each other.

13 See Case No. COMP/M.3280 – Air France/KLM.

14 See Case No. COMP/M.4439 – Ryanair/Aer Lingus.

15 Case No. COMP/M.3280 – Air France/KLM, paragraphs 24 et seq.

16 Case No. COMP/M.3280 – Air France/KLM, paragraphs 31 et seq.

17 See Case No. COMP/M.4439 – Ryanair/Aer Lingus, paragraph 99.

18 This criterion was determined on the basis of information received from 50 different airports that were asked about the "commercial arguments and material that they use for the purpose of marketing airport services towards carriers and attracting them on their tarmac", see Case No. COMP/M.4439 – Ryanair/Aer Lingus, paragraph 82.

19 The Commission for example did not use the 100km/one-hour proxy in a number of cases involving network carriers. See Case No. COMP/M.3280 – Air France/KLM, paragraphs 24-35; Case No. COMP/M.5335 – Lufthansa/SN Airholding, paragraph 54 et seq.; Case No. COMP/M.5403 – Lufthansa/BMI, paragraphs 45-47.

(16) In this case, the issue of whether flights from different airports are substitutable has been investigated in relation to the following airports in particular:

(i) Bratislava Airport ("BTS airport") – Vienna International Airport Schwechat ("VIE airport");

(ii) Frankfurt Hahn Airport ("HNN airport") – Frankfurt International Airport ("FRA airport");

(iii) Cologne-Bonn Airport ("CGN airport") – Düsseldorf International Airport ("DUS airport");

(iv) Brussels South Charleroi Airport ("CRL airport") – Brussels National Airport Zaventem ("BRU airport").

(17) For the O&D pairs at issue in this Decision, it is not always necessary to determine whether the flights from/to the different airports would be substitutable as it does not affect the competitive assessment. However, insofar as it is relevant for the assessment of this case, this issue will be discussed in greater detail in the competitive assessment in section VII.A.

(3) *Time sensitive v. non-time sensitive passengers*

(18) The Commission has previously considered that unrestricted tickets primarily purchased by so-called *time sensitive* passengers may be in a different market from restricted tickets primarily purchased by so-called *non-time sensitive* passengers.²⁰ On the one hand, time sensitive passengers tend to travel for business purposes, tend to book close to departure, require significant flexibility with their tickets (such as cost-free cancellation and modification of the time of departure), tend to pay higher prices for this flexibility and require a higher number of frequencies on a given O&D pair. On the other hand, non-time sensitive passengers travel predominantly for leisure purposes or to visit friends and relatives, book long in advance and do not require flexibility with their booking. Time sensitive passengers have therefore different preferences than non-time sensitive passengers, which is reflected in the different types of tickets targeted by airlines at these two different groups of passengers.

(19) The investigation of this case has confirmed that there exist broadly two categories of passengers with different needs and different price sensitivities, although some respondents have indicated that the distinction between time sensitive and non-time sensitive passengers is becoming less evident, as even time sensitive travellers have become increasingly price-focused and tend to prefer a restricted ticket over an unrestricted ticket if the price is lower. In fact, in light of the shift towards restricted tickets, most carriers, including low-cost carriers, offer rebooking services for restricted tickets (modifying either the date or the passenger's name) for a fee. Nevertheless, the distinction between non-time sensitive and time sensitive passengers, and hence restricted and unrestricted tickets, remains important. Time sensitive passengers still require a higher number of frequencies and specific departure and arrival times at the point of origin and destination. Finally, given the need for flexibility

²⁰ See Commission Decision of 11 August 1999 in Case No. COMP/JV.19 – KLM/Alitalia, OJ C 96, 05.04.2000, p. 5, paragraph 21; Case No. COMP/M.3280 – Air France/KLM, paragraph 19, Case No. COMP/M.3770 – Lufthansa/Swiss, paragraph 15.

and short overall travel time, time sensitive passengers appear to be less inclined to use secondary airports than non-time sensitive passengers.

- (20) Most respondents consider that time sensitive passengers need to maximise their time at destination and minimise their travel time. Hence, for the majority of respondents, this segment of passengers requires early morning and late afternoon flights (with an ideal morning departure at around 7.00 within a maximum time window between 6.30 and 8.30, and an afternoon departure time at around 18.00 or 19.00 in a maximum time window between 17.00 to 20.00). Time sensitive passengers also require a sufficient number of daily flight frequencies. At a minimum, two daily flights are required to allow for a same-day return, although a majority of respondents indicated that more than two daily flights are required for time sensitive passengers depending on the respective destination. This is also related to the type of carrier preferred by time sensitive passengers: the majority of respondents consider that time sensitive passengers prefer full service network carriers to low cost carriers. These views are shared by all of the responding groups: corporate customers, travel agents, and competing airlines.
- (21) The possibility of same-day return trips to short-haul destinations was considered important by all of the responding corporate customers (mostly in view of the time and costs saved), and the majority is even prepared to pay a slight premium in order to benefit from same-day return trips. This is also confirmed in the replies of responding travel agents.
- (22) With respect to the airport location, the majority of the responding travel agents and competitors indicate that primary airports located close to business centres and short travel distances to airports were more important for time sensitive than for non-time sensitive passengers. Corporate customers indicated that they have clear preference for minimising the travel time (and costs for the business trips) of their employees, regardless of whether they considered their employees as time sensitive or non-time sensitive.
- (23) The precise market definition can be left open for the purposes of this case.

(4) Substitutability of direct and indirect flights

- (24) The level of substitutability of indirect flights to direct flights largely depends on the duration of the flight. As a general rule, the longer the flight, the higher the likelihood that indirect flights exert a competitive constraint on direct flights.
- (25) With respect to short-haul routes, the Commission has considered in previous Decisions that indirect flights generally do not provide a competitive constraint to direct flights, absent exceptional circumstances (for instance where the direct flight does not provide the option of a convenient one-day return trip, an issue of particular importance for business travellers).²¹ The market investigation largely confirmed that for short-haul flights, indirect flights do not generally constitute a competitive alternative to direct flights, as customers indeed prefer direct flights.

21 See Commission Decision of 12 January 2001 in Case No. COMP/M.2041 – United/US Airways, and Commission Decision of 5 March 2002 in Case No. COMP/M.2672 – SAS/Spainair, OJ C 93, 18.4.2002, p. 7.

- (26) In previous Decisions, the Commission has assessed mid-haul routes,²² which are routes of more than three hours where direct flights normally do not provide the option of one-day return trips so that indirect flights are able to compete with direct flights. Due to the longer flight duration on such mid-haul routes, indirect flights seem to be more credible alternatives and some respondents indicated that indirect flights, in certain circumstances, constitute a competitive alternative. This is in line with the Commission's previous practice.²³
- (27) With respect to long-haul flights (flights over six hours covering a distance of over 5 000 km), the Commission has previously found that indirect flights constitute a competitive alternative to non-stop services under certain conditions, in particular when (a) they are marketed as connecting flights on the O&D pair in the computer reservation systems, (b) they operate on a daily basis and (c) they only result in a limited increase in travelling time (maximum 150 minutes).²⁴ The market investigation largely confirmed that indirect flights constitute a competitive alternative to direct flights when it comes to flights above six hours, and several respondents find them substitutable.

B. Air transport of cargo

- (28) With respect to air cargo transport markets, the Commission found, in previous Decisions, that the O&D approach to market definition with regard to air cargo transport is inappropriate, given that cargo is generally less time sensitive than passengers, and that cargo is usually transported by transmodal means of transport "behind" and "beyond" the origin and destination points. Accordingly, the relevant geographic market should be defined more broadly.
- (29) In line with previous Commission Decisions and the notifying party's submission, the market investigation in this case confirmed that for intra-European cargo transport, the relevant market could be defined as European-wide and would include alternative modes of transport, notably road and train transport, and to a lesser extent sea freight.²⁵
- (30) As regards intercontinental routes, the corresponding catchment areas broadly correspond to continents, at least for those continents where adequate transport infrastructure allows onward connections²⁶ (for instance by train, truck, inland waterways, etc.) such as Europe and North America. In line with previous Commission Decisions and the notifying party's submission, the market investigation in this case confirmed that the transport infrastructure across Asia is insufficient to consider the whole of Asia as a catchment area. Similarly, the transport infrastructure across the Middle East is insufficient to consider the whole of the Middle East as a catchment area. Hence, these catchment areas shall be considered on a country by country basis. Therefore, air cargo transport from Europe towards Asia and

22 Case No. COMP/M.3770 – Lufthansa/Swiss, paragraph 17, Case No. COMP/M.4439 Ryanair/Aer Lingus, paragraph 288 et seq.

23 See Case No. COMP/M.5335 – Lufthansa/SN Airholding, paragraph 45.

24 See, for example, Cases No. COMP/M.2041 – United/US Airways and No. COMP/M.2672 – SAS/Spanair.

25 See Case No. COMP/JV.19 – KLM/Alitalia and Commission Decision of 10 May 1999 in Case No. IV/M.1506 – Singapore Airlines/Rolls-Royce, OJ C 176, 22.6.1999, p. 11.

26 See Case No. COMP/M.3280 – Air France/KLM and Case No. COMP/M.3770 – Lufthansa/Swiss.

Middle East should be assessed on continent (Europe) to country basis (the respective countries in Asia and Middle East).

- (31) In addition, the market investigation confirmed that, as air cargo transport markets are inherently unidirectional due to differences in demand at each end of the route, they must be assessed on a unidirectional basis.²⁷
- (32) In previous cases, the Commission left open the question whether the market for air cargo transport should be further sub-divided according to the nature of the cargo. The Commission, however indicated that some types of goods, such as dangerous goods, may require special handling so that they can be transported only on full-freighter aircraft.²⁸ The parties argue that this market should not be further divided by category or nature of transported products. In this regard, the market investigation confirmed that a further segmentation of the market would not be necessary. In any event, for the purposes of this Decision, such further segmentation is irrelevant as the proposed transaction would not significantly impede effective competition under any alternative market definition.

C. Supply of airline seats to tour operators

- (33) The Commission has in previous Decisions noted that the wholesale supply of airline seats to tour operators is distinct from the market for supply of scheduled air transport to end customers and that such markets for wholesale supply of airline seats to tour operators are national in scope.²⁹
- (34) The notifying party largely accepts the previously applied product market definitions, but submits that a market for the provision of airline seats to tour operators would geographically comprise both Austria and Germany, noting that all major charter operators in Austria are also active in Germany, and that the competitive conditions in both Member States are converging due to the lack of language barriers, similar customer preferences and minimal price differences between Austria and Germany.
- (35) In this case, the market investigation did not contradict the Commission's previous findings on the existence of a separate market of wholesale supply of airline seats to tour operators. Concerning the geographic scope of that market, the investigation did not fully clarify whether it is national in scope or comprises both Germany and Austria. While respondents pointed to different market conditions in Austria and Germany, some respondents also underlined the proximity of the Austrian and German markets, particularly for customers living in the western parts of Austria, for which the German market seems to be a viable alternative.

27 See Commission Decision of 6 August 2008 in Case No. COMP/M.5181 – Delta Air Lines/Northwest Airlines, OJ C 281, 5.11.2008, p. 3.

28 See Case No. COMP/M.3280 – Air France/KLM.

29 See, for example, Commission Decision of 17 December 2008 in Case No. COMP/M.5141 – KLM/Martinair, OJ C 51, 4.3.2009, p. 4-8, paragraph 121 or Case No. COMP/M.4439 – RyanAir/Aer Lingus, paragraph 299.

(36) For the purposes of this case and in line with previous cases, the relevant product market is the market for wholesale supply of airline seats to tour operators, whereby it can be left open whether it is necessary to distinguish between long-haul and short-haul routes. The geographic market definition can also be left open. The proposed transaction would not significantly impede effective competition under any geographic market definition.

D. Maintenance, Repair and Overhaul ("MRO")

(37) The Commission has previously distinguished four separate markets within the MRO sector, namely line maintenance, heavy maintenance, engine maintenance and components maintenance.³⁰

(38) Although the geographic scope of the market for MRO services is usually considered as at least EEA-wide,³¹ the geographic dimension of the market for line maintenance services could be considered narrower (regional). Furthermore, in its most recent Decisions, the Commission has left the geographic market definition with regard to MRO services open.³²

(39) For the purposes of this Decision, it is not necessary to determine the geographic scope of the market for MRO services as the proposed transaction would not significantly impede effective competition under any possible product market definition.

E. In-flight catering

(40) In previous cases, the Commission found that the in-flight catering market comprises all in-flight catering services, including for short-haul and medium-haul flights, economy and business class and hot/cold meals and snacks as well as other ancillary services.³³ The Commission has more recently indicated that this market has evolved significantly in the past few years and new types of in-flight catering services have emerged.³⁴

(41) For the purposes of this Decision, it is not necessary to determine whether the in-flight catering market should be further segmented into traditional catering services and new type suppliers' services or comprises both, since the proposed transaction would not significantly impede effective competition under any possible product market definition.

30 See Case No. COMP/JV.19 – KLM/Alitalia, Case No. COMP/M.3280 – Air France/KLM and Commission Decision of 14 April 2004 in Case No. COMP/M.3374 – SR Technics/FLS Aerospace, OJ C 180, 13.7.2004, p. 9.

31 See Case No. COMP/JV.19 KLM/Alitalia.

32 See Case No. COMP/M.3280 - Air France/KLM, Case No. COMP/M.3374 – SR Technics/FLS Aerospace, Commission Decision of 16 February 2009 in Case No. COMP/M.5399 – Mubadala/Rolls Royce/JV, OJ C 58, 12.3.2009, p. 4, and Case No. COMP/M.5403 – Lufthansa/BMI.

33 See Commission Decision of 1 June 2001 in Case No. COMP/M.2190 – LGS/OFSI, OJ C 238, 24.8.2001, p. 4.

34 See Commission Decision of 19 July 2006 in Case No. COMP/M.4170 – Lufthansa Service Holding/Gate Gourmet Switzerland, OJ C 11, 17.1.2007, p. 2.

(42) The geographic market for in-flight catering is considered to be limited to the relevant airport or airport region (where several airports are located in close proximity to each other).³⁵

F. Groundhandling

(43) In previous Decisions, the Commission found that groundhandling services – ranging from passenger and baggage registration and handling to leading the aircraft on the ground as well as cleaning and refuelling the aircraft – could be divided into several distinct segments but the determination whether each segment constituted a separate relevant market was left open.³⁶ The Commission further indicated that the relevant geographic market for groundhandling services is normally restricted to the airport where the groundhandling services are provided.³⁷

(44) It is not necessary for the purposes of this Decision to determine an exact market definition, as the transaction would not significantly impede effective competition under any possible product and geographic market definition.

VI. CONCEPTUAL FRAMEWORK FOR THE ASSESSMENT OF THE PROPOSED TRANSACTION

A. Introduction

(45) Prior to the notification of the proposed transaction, the Commission received a notification of a transaction on 26 November 2008 according to which LH intended to acquire sole control of SN Airholding SA/NV, the holding company of SN.³⁸ Having initiated proceedings in that case pursuant to Article 6(1)(c) of the Merger Regulation on 26 January 2009, the Commission authorised the acquisition of SN by LH subject to conditions on 22 June 2009.

(46) Moreover, on 3 April 2009, the Commission also received notification of a transaction whereby LH intended to acquire sole control of BMI.³⁹ The Commission approved this transaction on 14 May 2009 without conditions.

(47) Closing of LH's transactions with SN and BMI occurred on 24 June 2009 and 1 July 2009, respectively, and they were subsequently implemented. Both SN and BMI are therefore treated as subsidiaries of LH.

35 See Case No. COMP/M.4170 – Lufthansa Service Holding/Gate Gourmet Switzerland.

36 See Commission Decision of 11 January 2001 in Case No. COMP/M.2254 — Aviapartner/Maersk/Novia, OJ C 027, 27.1.2001, p. 60, and Commission Decision in Case No. IV/M.1913 – Lufthansa/Menzies/LGS/JV, OJ C 127, 27.4.2001, p. 11.

37 See Case No. COMP/M.1913 – Lufthansa/Menzies/LGS/JV.

38 Case No. COMP/M.5335 – Lufthansa/SN Airholding.

39 Case No. COMP/M.5403 – Lufthansa/BMI.

- (48) Prior to assessing the impact of the transaction on the relevant markets, the conceptual framework for the assessment of the transaction must be determined. In this respect, that transaction raises two conceptual issues.
- (49) The first issue concerns the treatment of LH's and OS's alliance partners for the purposes of both the determination of affected markets and the competitive assessment of the transaction.
- (50) The second issue relates to the determination of the relevant counterfactual for the assessment of the effects of the transaction with respect to the routes where LH (including LX, 4U, SN and BMI) and OS co-operate with each other.

B. Treatment of alliance partners

- (51) Both LH and OS are members of the Star Alliance. The notifying party submits that it would be inappropriate to treat any of its alliance partners as if they were parties to the transaction. First, there would be no legal basis for such a treatment as the Merger Regulation does not provide for an assessment of "spill-over effects" between companies that remain independent. Second, alliance relationships in question would not change the merging parties' incentives to compete because both LH and OS are already part of the same alliance pre-merger and because the overlap routes between OS's and LH's alliance partners are not covered by the respective co-operation agreements. In addition, LH's agreements would not automatically extend to OS and vice versa.

(1) Determination of affected markets

- (52) With respect to the determination of affected markets, horizontally affected markets consist of relevant product markets where the parties to the proposed transaction are engaged in business activities and hence on which the transaction produces merger-specific effects.⁴⁰ Accordingly, product markets where one party and a third party's activities overlap are in principle outside of the scope of the investigation as the transaction is not likely to produce merger-specific effects on these markets. However, a transaction may also have a significant impact on other markets in which case the effects on competition on such market should also be assessed.
- (53) In the airline sector, this is in particular the case where a factual inquiry indicates, as a direct result of the merger or as its foreseeable consequence, that close links are to be established between one merging party and a close partner of the other merging party, as was the case between KLM and Alitalia in the Air France/KLM merger case for instance.⁴¹ In such cases, the incentives to compete would indeed be altered as a result of the merger.

40 See paragraph III (a) in Annex I to the Commission Regulation (EC) 802/2004 of 7 April 2004 implementing Council Regulation (EC) 139/2004 on the control of concentrations between undertakings, OJ L 133, 30.4.2004, p. 1.

41 Case No. COMP/M.3280 – Air France/KLM, paragraph 47.

- (54) In this case, according to the notifying party, LH's co-operation agreements with SAS, LOT, United Airlines and Air Canada will not be extended to OS as the agreements do not provide for such an automatic extension unless they are renegotiated. Similarly, the parties have confirmed that none of the existing agreements between OS and other Star Alliance partners⁴² will be automatically extended to LH. As a result, no merger specific spill-over effects are expected to arise in this respect.
- (55) LH's and OS' alliance partners should not be taken into account for the determination of affected markets.

(2) *Competitive assessment*

- (56) With respect to the competitive analysis on the affected markets, the relationship between the airlines and for the subsequent impact on their incentive to compete post-merger ought to be assessed on a route-by-route basis. If it is found that a merging party and a third party have a lower incentive to compete as a consequence of the transaction, this fact must be taken into account in the assessment.

C. Relevant counterfactual for the routes on which the parties co-operate

- (57) LH and OS already co-operate in different ways pre-merger in varying degrees. In particular, the following forms of co-operation between the parties can be identified: (i) a cost and revenue sharing joint venture between LH and OS on all routes between Germany and Austria; (ii) a world-wide bilateral co-operation agreement between LH and OS; (iii) a code-share agreement between LX and OS on Switzerland-Austria routes; and (iv) a code-share agreement between BMI and OS on the Vienna-London route.
- (58) The notifying party submits that such pre-merger co-operation should constitute the relevant counterfactual for the assessment of the transaction. The notifying party further argues that, as a result of the existing co-operation agreements, the parties cannot be considered competitors, particularly as far as Austria-Germany routes are concerned, and therefore the transaction cannot result in any decrease in competition between LH and OS. The notifying party further submits that the Commission had previously found in its Lufthansa/Eurowings and Lufthansa/Swiss Decisions⁴³ that LH and OS did not compete on a global level. In those Decisions, the overlaps between LH, OS and 4U and between LH, OS and LX, respectively, had already been analysed and addressed, and therefore the present transaction could not be found to significantly impede effective competition on these routes.
- (59) Pursuant to paragraph 9 of the Guidelines on the assessment of horizontal mergers under the Council Regulation on the control of concentrations between undertakings ("the Horizontal Merger Guidelines") "[i]n assessing the competitive effects of a merger, the Commission

42 None of these agreements goes beyond a bilateral alliance and/or code-share agreement. In particular, none of them even comes close to a profit sharing joint venture such as that existing between LH and OS with respect to the Germany-Austria routes.

43 See Case No. COMP/M.3770 – Lufthansa/Swiss and Commission Decision of 22 December 2005 in Case No. COMP/M.3940 – Lufthansa/Eurowings, OJ C 18, 25.1.2006, p. 22.

compares the competitive conditions that would result from the notified merger with the conditions that would have prevailed without the merger. In most cases the competitive conditions existing at the time of the merger constitute the relevant comparison for evaluating the effects of a merger. However, in some circumstances, the Commission may take into account future changes to the market that can reasonably be predicted."⁴⁴

(60) In this case it appears, on the basis of the evidence collected in the investigation and in light of the Austrian Government's fundamental decision to find a private investor for OS that absent the acquisition by LH, OS would most likely have been acquired by Air France-KLM in which case the co-operation between OS and LH would have been terminated.

(61) On that basis and on the basis of the evidence available to the Commission, the relevant counterfactual scenarios for the assessment of the effects of the notified concentration on competition are:

(1) the pre-merger state of co-operation between the parties; or

(2) the most likely foreseeable future development in the event that the proposed acquisition of OS by LH does not take place, namely where OS is acquired by another airline, more specifically by Air France-KLM. In this scenario, OS would terminate its pre-merger co-operation with LH as well as its Star Alliance membership and would join Sky Team (the alliance to which Air France-KLM belongs).

(62) Both the counterfactual scenario of pre-merger co-operation and the counterfactual scenario of acquisition of OS by Air France-KLM are explained in paragraphs (63) - (105) in more detail.

(1) Counterfactual scenario of pre-merger co-operation

(63) As mentioned in paragraph (57), the following forms of co-operation between the parties can be distinguished: (a) a cost and revenue sharing joint venture between LH and OS on all routes between Germany and Austria; (b) a world-wide bilateral co-operation agreement between LH and OS and (c) a code-share agreement between BMI and OS on the Vienna-London route. In addition, the Commission has previously analysed and assessed (d) the overlaps between LH, OS and 4U in its Lufthansa/Eurowings Decision; and (e) the overlaps between LH, OS and LX in its Lufthansa/Swiss Decision, and where LX and OS currently co-operate under a code-share agreement on Swiss-Austrian routes.

⁴⁴ Guidelines on the assessment of horizontal mergers under the Council Regulation on the control of concentrations between undertakings, OJ C 31, 05.02.2004, p. 5-18.

a. Cost and revenue sharing joint venture between the parties on all routes between Germany and Austria

(i) Description of the pre-merger situation

- (64) The cost and revenue sharing joint venture provides that the parties pool revenues and costs for all routes between Germany and Austria, and coordinate on fares and other matters, including marketing and branding. Under the joint venture agreement, the parties established a joint route system (specifying which services are operated by which party), joint fare structures and flight schedules. Fares sold in Germany are set by LH, while fares sold in Austria are set by OS. The parties also entered into code-share agreements on all routes between Germany and Austria. On some routes, they both operate their own aircraft and code-share on the other party's flights.⁴⁵ On others, one of the parties operates its own aircrafts, whereas the other party is merely a marketing carrier with no operations of its own.⁴⁶
- (65) The parties initially notified the joint venture agreement to the Commission under Article 81(3) of the Treaty in 1999.⁴⁷ The Commission found that the agreement restricted actual and potential competition between LH and OS within the meaning of Article 81(1) of the Treaty on all routes between Austria and Germany,⁴⁸ but that it also contributed, under certain conditions, to economic progress within the meaning of Article 81(3) of the Treaty. In 2002, the Commission therefore exempted the joint venture agreement pursuant to Article 81(3) of the Treaty until December 2005, subject to commitments aimed at ensuring that consumers would share in the benefits of the expected cost savings, that the restrictions of competition did not go beyond what was necessary and that competitors would be present on the market. The remedies essentially consisted of a commitment to make slots available to a new entrant for any Austria-Germany route chosen by it up to a maximum of 40% of the slots that LH and OS operated on the route in question.⁴⁹
- (66) After the expiry of the exemption decision in 2005, the parties continued to co-operate under the joint venture agreement. Under the new procedural rules for the application of Article 81

45 This currently occurs on six routes: Vienna-Berlin, Vienna-Düsseldorf, Vienna-Frankfurt, Vienna-Hamburg, Vienna-Munich and Vienna-Stuttgart.

46 OS currently acts as an operating carrier on ten routes: Graz-Düsseldorf; Innsbruck-Frankfurt, Linz-Düsseldorf, Salzburg-Düsseldorf, Salzburg-Frankfurt, Vienna-Cologne, Vienna-Dresden, Vienna-Hannover, Vienna-Leipzig and Graz-Stuttgart. LH is an operating carrier on six routes: Graz to Frankfurt and Munich; Innsbruck-Hamburg, Klagenfurt-Munich, Linz to Frankfurt and Munich. OS ceased its operations on the route Vienna-Nuremberg in March 2009.

47 See Case No. IV/37.730 – Austrian Airlines Österreichische Luftverkehrs AG/Deutsche LUFTHANSA AG, Exemption with condition/obligation decision, Web publication of non-confidential version, OJ L 242, 10.09.2002, p. 25-43; Final version of Art. 19(3) notice, OJ C 356, 14.12.2001, p. 5-8; and Final version of Art. 19(3) notice, OJ C 193, 11.07.2000, p. 7-8.

48 In 1999, there were 33 routes between Austria and Germany. Only one route, namely the route Vienna-Friedrichshafen, was not operated by either LH or OS, but by Rheintalflug. Rheintalflug was taken over by OS in 2001.

49 Moreover, they included fare control remedies as well as capacity freezes in relation to those Austria-Germany routes on which new entrants would start operating.

of the Treaty, notably Regulation 1/2003,⁵⁰ it was not possible for the parties to apply for a new exemption. However, the parties carried out a self-assessment of their co-operation under the joint venture agreement with a view to complying with Article 81 of the Treaty.⁵¹

(ii) Impact of the transaction on the pre-merger situation

- (67) As previously stated, the notifying party submits that, as a result of their co-operation, LH and OS cannot be considered as competitors on any Austria-Germany routes, and that the proposed transaction can therefore not result in any lessening of competition between them.
- (68) However, even where a pre-merger situation that effectively limits or eliminates competition between the parties constitutes the relevant counterfactual, this does not automatically mean that the proposed transaction cannot lead to a significant impediment to effective competition. Indeed, where extensive pre-merger co-operation has been replaced by a permanent structural link, the Commission has analysed the specific effects of the creation of that permanent structural link on a route by route basis (in particular on hub-to-hub routes) in order to assess the extent to which competition may be affected post-merger.⁵²
- (69) Whether or not the creation of a permanent structural link in this case would lead to a significant impediment of effective competition in the form of elimination of actual or potential competition will therefore be assessed in the competitive assessment of the individual routes at issue in section VII.

b. World-wide bilateral agreement between LH and OS

(i) Description of the pre-merger situation

- (70) The world-wide bilateral agreement between LH and OS provides for joint network planning, a joint pricing policy and joint budgeting. However, each party is responsible for its own route and network development, bilateral co-operation with other carriers and sales and marketing activities. LH submits that LH and OS do not discuss prices on a regular basis and that the degree of co-operation varies from destination to destination. Nevertheless, LH claims that the scope of LH and OS' world-wide co-operation is already so extensive that they cannot be perceived as competitors for the purpose of establishing the proper counterfactual.
- (71) In 2002, the world-wide bilateral agreement between LH and OS was exempted by the Commission under Article 81(3) of the Treaty until December 2005, but without commitments on the part of LH or OS. In its exemption Decision, the Commission found that, except as regards traffic between Austria and Germany, the networks of LH and OS largely complemented one another. While OS focused on medium-haul routes in Europe, especially in Central and Eastern Europe, LH focused much more on long-haul services. The

50 Council Regulation (EC) No 1/2003 of 16 December 2002 on the implementation of the rules on competition laid down in Articles 81 and 82 of the Treaty, O.J. L 1, 04.01.2003, p.1.

51 The parties have provided the Commission with a copy of the self-assessment which seems to date from 2006.

52 See also Case No. COMP/M.5181 – Delta Air Lines /Northwest Airlines, paragraphs 32 and 33.

Commission found that the combination of these complementary networks resulted in important synergistic effects and attractive connections for consumers and that the establishment of a more comprehensive European network would produce cost savings for LH and OS through an increase in traffic throughout the network, improved network connection, better planning of frequencies, a higher load factor and improved organisation of sales systems and ground handling services.

(ii) Impact of the transaction on the pre-merger situation

- (72) As will be demonstrated in the competitive assessment in section VII, the issue whether the scope of LH's and OS' world-wide co-operation is already so extensive that they cannot be perceived as competitors for the purpose of establishing the proper counterfactual can be left open, since the proposed concentration would not significantly impede effective competition on any routes outside Germany and Austria that fall into this worldwide co-operation, irrespective of the precise counterfactual scenario.

c. Code-sharing between BMI and OS on the Vienna-London route

(i) Description of the pre-merger situation

- (73) OS has standard free-flow code-share agreements with BMI with regard to the Vienna-London route.
- (74) The notifying party submits that under such a code-share agreement, the marketing carrier does not have its own reserved inventory on the aircraft in question, but has real-time electronic access to the operating carrier's seat inventory. This means that prior to confirming a booking on the flight in question, the marketing carrier must ascertain whether a seat in the appropriate category is still available. The operating carrier retains inventory control in order to ensure that the marketing carrier does not fill the flight with low-yield traffic (that is, cheap restricted economy tickets for O&D passengers) when such bookings would squeeze out higher-yield passengers the operating carrier could otherwise attract (namely O&D or connecting business class passengers). This is achieved by a process of "mapping" the carriers' respective fare classes and providing the marketing carrier access to seats in the relevant corresponding fare category on a "first come, first serve" basis. Thus, the marketing carrier is offered equal treatment in terms of accessing seats on a flight, without however undermining the operating carrier's yield management system.
- (75) LH argues that due to OS' control over inventory available to BMI, competition between the parties on this route is limited and, as a result, the proposed concentration would not significantly impede effective competition on this route.

(ii) Impact of the transaction on the pre-merger co-operation

- (76) As will be shown in the competitive assessment in section VII, the question whether or not OS and BMI can be perceived as competitors under the current code-share agreement can be

left open, since the proposed concentration would not significantly impede effective competition on this route, irrespective of the precise counterfactual scenario.

d. Overlap routes between OS and Eurowings, where the Commission found in the Lufthansa/Eurowings merger Decision that LH and OS do not compete

(i) Description of the pre-merger situation

(77) Eurowings was not yet a subsidiary of LH at the time of the exemption Decision and was therefore not covered by the exemption. Moreover, Eurowings does not form part of any of the existing co-operation agreements between OS and LH nor does Eurowings (or its subsidiary 4U) have its own co-operation agreement with OS. The Commission found in its Lufthansa/Eurowings Decision that LH and OS did not compete on a global level. As a consequence, the Commission assessed the effects of a combination of Eurowings and LH, whereby it did not consider OS as a competitor to LH, and authorised the acquisition of Eurowings by LH subject only to slot release commitments with respect to the Vienna-Cologne and Vienna-Stuttgart routes, amongst others, where it considered that the transaction would eliminate Eurowings as LH's only competitor.

(78) As regards overlaps between OS and Eurowings, the notifying party argues that these overlaps have already been analysed and addressed in the aforementioned merger Decision and that, therefore, these overlaps cannot be considered as affected markets or, in any event, the transaction cannot be found to significantly impede effective competition on these routes.

(ii) Impact of the transaction on the pre-merger situation

(79) It should be noted that OS was not a formal party to the concentration between LH and Eurowings which were the subject of the previous Decisions nor did the previous Decision relate to the creation of a permanent structural link between OS on the one hand and LH or Eurowings on the other hand. Rather, the overlaps between Eurowings and OS were included in the competitive assessment of this previous Decision because of the extensive contractual co-operation that already existed between LH and OS at the time. Therefore, insofar as the transaction effectively eliminates actual or potential competition between Eurowings and OS, there is no reason why these overlaps could not be subject to review in this case.

(80) In this respect, it is important to note that Eurowings' activities do not in any way form part of the joint venture between LH and OS with respect to the Austria-Germany routes. The extent to which the present transaction eliminates actual competition between OS and 4U will therefore be examined in the competitive assessment in section VII.

e. *Overlap routes between OS and LX where the Commission found in the Lufthansa/Swiss merger Decision that LH and OS do not compete and where LX and OS currently cooperate under a code-share agreement on Swiss-Austrian routes*

(i) *Description of the pre-merger situation*

(81) Similarly, LX did not belong to LH at the time of the 2002 exemption decision and this cooperation was therefore not covered by the exemption of the world-wide bilateral agreement between LH and OS. However, the overlap between LX and OS has also already been subject of the Lufthansa/Swiss Decision where the Commission found that LH and OS could not be considered as competitors on a global level.⁵³ As a consequence, the Commission assessed the effects of a combination of LX and LH, whereby OS was not considered as a competitor to LH, and authorised the acquisition of LX by LH subject only to slot release commitments on several routes such as the Zurich-Vienna route.

(82) With regard to these overlaps, the notifying party argues that they have already been analysed and addressed in the merger Decision mentioned in the preceding paragraph and that, therefore, these overlaps cannot be considered as affected markets or, in any event, the transaction cannot be found to significantly impede effective competition on these routes. Furthermore, with respect to the code-share agreement between LX and OS in general, LH argues that due to OS' control over inventory available to LX on the Vienna-Zurich, Vienna-Geneva and Vienna-Basle routes and LX's control over inventory available to OS on the Vienna-Zurich route, competition between the parties is limited and, as a result, the transaction would not raise competition concerns with respect to these three routes.

(ii) *Impact of the transaction compared to the pre-merger situation*

(83) It should be noted that after the Commission's Lufthansa/Swiss Decision, LX and OS concluded a standard free-flow code-share agreement relating to all Austria-Switzerland routes. This represents a significant change on those routes, which was not assessed in that Commission Decision. In particular, this code-share agreement has allowed LX to gain a marketing presence on several of these markets, which would make it easier for LX to enter those routes.⁵⁴

(84) As will be shown in the competitive assessment in section VII, the establishment of the precise counterfactual can ultimately be left open since the proposed concentration would not significantly impede effective competition on any route between Austria and Switzerland.

(2) *Acquisition of OS by another airline, more specifically by Air France-KLM as relevant counterfactual for the assessment of the proposed transaction*

⁵³ See Case No. COMP/M.3770 – Lufthansa/Swiss.

⁵⁴ The assessment of the Vienna-Basel and Vienna-Geneva routes in the Lufthansa/Swiss Decision was based on the fact that LX did not provide direct services on the Vienna-Geneva route and that it had withdrawn from the Vienna-Basel route before the Decision (see paragraphs 90 et seq. of that Decision).

- (85) As indicated in paragraph (61), it appears likely that, absent the acquisition by LH, OS would have been acquired by another airline, namely Air France-KLM. Therefore, the most likely foreseeable alternative counterfactual to the pre-merger situation for the assessment of the transaction, would be a foreseeable situation whereby OS is acquired by another airline, more specifically by Air France-KLM. As a consequence of such a transaction, OS would terminate its existing agreements with LH as well as its Star Alliance membership to join another alliance, namely the SkyTeam Alliance, to which Air France-KLM belongs. As explained in more detail in section VII, OS would then operate several routes in competition with LH, instead of operating them in co-operation with LH, as it currently does (hereinafter the "Air France-KLM counterfactual").
- (86) In light of the fundamental political decision to privatise OS, the bidding process for the privatisation of OS would most likely have been prolonged and negotiations with other interested parties would have continued in case LH would not have made an offer during the initially foreseen deadline for the privatisation process. The evidence available to the Commission⁵⁵ suggests that the most likely alternative to an acquisition of OS by LH would have been the acquisition of OS by another airline, more specifically by Air France-KLM. As a consequence of this foreseeable scenario, OS would terminate its existing agreements with LH as well as its Star Alliance membership to join the SkyTeam Alliance, to which Air France-KLM belongs.
- (87) Based on the information available to the Commission, it appears that OS would not be financially viable in the long term without drastic recapitalisation, asset sales and restructuring, but that such drastic restructuring and downsizing would likely entail serious risks and significant negative consequences. Therefore, the privatisation of OS was considered the preferred option.⁵⁶ As a result, on 12 August 2008, the Austrian Government issued a privatization mandate ("Privatisierungsauftrag") pursuant to which ÖIAG was authorised to dispose of all of its shares in Austrian Airlines.
- (88) ÖIAG published notices in Austrian and international newspapers on 13 August 2008 inviting potential investors to express their interest on an acquisition of ÖIAG's stake in OS until 24 August 2008. On 28 August 2008 potential investors were notified that an acquisition concept including information on the bidder, a strategic concept on the future of OS, a proposal for the transaction structure, information on the proposed financing and certain additional information should be submitted by 12 September 2008. Only three acquisition concepts were received (namely Air France-KLM, LH and Siberian Airways). On 16 September 2008 the three remaining bidders were invited to submit their final offers excluding the purchase price by 21 October 2008 and their final offer including the purchase price by 24 October 2008.
- (89) On 21 October 2008, LH was the only bidder to submit an offer including contract and strategic concept, excluding price. On 24 October 2008 LH submitted a binding offer stating a negative purchase price for OS. While Siberian Airways submitted an explicitly non-

55 See in particular the documents quoted in footnotes 56 and 63.

56 See [various OS internal documents]*.

binding offer on 24 October 2008⁵⁷, it does not appear to be or have been a serious candidate for the purchase of OS, in particular since, for the time being, it is (apart from a few direct international connections) focused on flights to Russian destinations and destinations in the Commonwealth of Independent States with a large domestic route network in Russia and its main bases and hubs in Russia. Air France-KLM did not make any offer, binding or non-binding. According to Air France-KLM, the two main reasons why it decided to not submit an offer by 21 October 2008 were that (i) it had come to the conclusion that there was no viable financial offer meeting the conditions imposed by ÖIAG in the privatisation process, and that (ii) Air France-KLM was not provided with all the necessary information that would have enabled it to undertake an in-depth and definitive evaluation of OS' financial situation.⁵⁸

- (90) Following LH's offer, the Austrian authorities prolonged ÖIAG's privatisation order until 31 December 2008 and authorized ÖIAG to grant supporting measures to OS of up to EUR 500 million.⁵⁹
- (91) Despite the fact that Air France-KLM did not formally submit any offer in the context of the privatisation of OS, the Commission's investigation has shown that Air France-KLM would be the most likely alternative buyer. In this respect, it should be noted that, when Air France-KLM became aware of the supporting measures referred to in the preceding paragraph, it once again expressed its interest in continuing the negotiations for a possible purchase of OS by informing ÖIAG that it was prepared to consider submitting a final offer to OS (*"We are writing to you today to confirm that Air France-KLM remains keen to invest in Austrian and to express our willingness to continue to participate to the current privatisation process as the conditions seem to have become materially different from the ones envisaged both in terms of acceptable equity price, amount of debt burden and acceptable date for a fully binding offer"*).⁶⁰
- (92) Internal LH documents seemingly based on OS' business plan, also indicate that LH seriously considered a scenario whereby OS would be acquired by Air France-KLM.⁶¹ It can be assumed that such an alternative scenario would be less profitable for Air France-KLM than for LH since OS would lose revenues from the joint venture with LH and would need to pay alliance exit fees. Nevertheless, OS' current financial situation appears to be such that it would probably be very difficult, if not impossible, for OS to remain independent in the long term and to continue operating on a stand-alone basis without external support.
- (93) Indeed, LH assumes on the basis of OS' financial statements dated October 2008 that, without any external support, OS would be insolvent in the first half 2009.⁶² If OS were to

57 See the article entitled "Zwei Angebote zu AUA: Lufthansa prozesskonform, S7 in Prüfung" at www.kleinezeitung.at/nachrichten/wirtschaft/aua/1605399/index.do.

61 LH's document entitled [...]*

62 LH's document entitled [...]*.

remain independent it is likely that Austria, as the largest and sole controlling shareholder would have to recapitalise and restructure the company.

- (94) OS also assessed different options and an acquisition by Air France-KLM appeared to be the most credible foreseeable alternative to an acquisition by LH⁶³ and, in particular, the preferred option in comparison to a scenario whereby OS would remain independent, drastically restructure and downsize. More specifically, OS internal documents refer to the option of privatising and selling OS as "Plan A", whereas the option of OS remaining independent, restructuring and downsizing is referred to as "Plan B".⁶⁴ This can be further illustrated by the fact that OS estimates that a stand-alone OS operation would require additional funding of EUR 1.2 billion until 2011.⁶⁵ This amount significantly exceeds the amount of measures to be granted by ÖIAG in support of the privatization of OS by way of a sale to LH.
- (95) In addition, internal documents of the various parties involved in the privatisation process show a clear political will to privatise OS.
- (96) Finally, if LH would not have submitted an offer, the bidding process for the privatisation of OS would have been prolonged and negotiations with other interested parties would have continued. Air France-KLM was also the most likely alternative purchaser in the bidding process organised in autumn 2008 with a view to privatising OS.
- (97) In this respect, it should be recalled that Air France-KLM refrained from making a final binding offer by 21 October 2008 because of OS's financial situation. When it subsequently became clear that the Austrian authorities would underwrite a EUR 500 million capital increase in OS, however, Air France-KLM re-expressed its interest in acquiring OS under these changed circumstances, but ÖIAG stated that it was obliged to follow the established sales process and refused to re-enter into negotiations with Air France-KLM and, instead, proceeded with the sale of OS to LH.⁶⁶
- (98) On the basis of the evidence available to the Commission, it therefore seems that, if LH would not have submitted an offer, the bidding process for the privatisation of OS would have been prolonged and negotiations with other interested parties would have continued, and the acquisition of OS by Air France-KLM would likely have been the most likely outcome.

63 See [various OS internal documents]* From these documents it follows also clearly that an acquisition of OS by Air France-KLM would necessarily imply that OS would need to exit Star Alliance and join SkyTeam.

64 See in particular the documents quoted in footnotes 56 and 63.

65 OS internal document [...]*

66 See letters of Air France/KLM to Merrill Lynch of 21 October 2008 and 5 November 2008; see further some press articles reporting on the matter, such as the articles entitled "Air France-KLM buhlt um AUA und Alitalia: Wird fristgerecht ihr Angebot einreichen" of 9 September 2008 and "Air France-KLM will wieder ins AUA Rennen: Die ÖIAG lehnt einen erneuten Einstieg ab" at www.news.at, the articles entitled "Airline-Übernahme, Air France zieht bei AUA zurück" of 22 October 2008 and "Übernahmepoker um Austrian Airlines, Air France fühlt sich benachteiligt" of 21 November 2008 at www.handelsblatt.com/unternehmen, and the articles entitled "AUA: Air France/KLM hat die Nase vorn" of 7 October 2008 and "AUA-Verkauf: Air France will wieder mitbieten" of 7 November 2008 at www.diepresse.com.

- (99) Based on the evidence available to the Commission, the conclusion would have been no different today compared to when the bidding process took place. Indeed, while the economic environment since the end of the bidding process might have had a negative impact on the airline industry as a whole, including Air France-KLM and OS, it is considered that the main reasons that motivated Air France-KLM to acquire OS in the course of the bidding process are still valid today.⁶⁷ Furthermore, adverse economic circumstances in fact reinforce the conclusion reached in paragraph (94) that OS would not be financially viable in the long term without drastic recapitalisation, asset sales and restructuring, that such drastic restructuring and downsizing would likely entail serious risks and significant negative consequences and that the privatisation of OS would therefore also represent the preferred option in the medium- and long-term.
- (100) The fact that the Air France-KLM counterfactual is the most likely future development, if the proposed acquisition of OS by LH were to fail, can be further illustrated by the parties' internal documents which show that both parties seriously considered an alternative acquisition of OS by Air France-KLM. In response to several requests for information, LH did not submit any internal documents in which purchasers other than Air France-KLM are considered. In OS's documents, alternative purchasers are discussed, but LH and Air France-KLM are considered the two preferred options.
- (101) Therefore, the acquisition by Air France-KLM is the most likely foreseeable alternative counterfactual to the pre-merger situation for the assessment of the transaction.
- (102) Taking this counterfactual scenario as a basis for the competitive assessment, the transaction raises serious doubts as to its compatibility with the common market because it may significantly impede effective competition, insofar as the transaction eliminates actual or, at least potential competition between the parties on a number of routes, as set out in more detail in the competitive assessment in section VII, in the foreseeable situation whereby OS would be acquired by Air France-KLM and, as a result, OS would terminate its existing co-operation agreements with LH, exit Star Alliance and join SkyTeam. In particular, as a result of the foreseeable acquisition of OS by Air France-KLM and the subsequent termination of the co-operation agreements between LH and OS, OS and LH would have been actual or potential competitors on the relevant routes.
- (103) In this respect, LH internal documents indicate that LH examined the possible risks of OS terminating the existing co-operation agreements and joining SkyTeam and concluded that, in that foreseeable scenario, LH would need to add frequencies and new routes to its current network ⁶⁸ [...]*. In the relevant internal documents, LH noted in particular that it would need to add [...]* weekly frequencies to the Vienna-Munich and Vienna-Frankfurt routes. The extent to which actual or potential competition between LX and OS on these routes will be eliminated post-merger as compared to the alternative acquisition of OS by Air-France-KLM is therefore assessed in this Decision.

67 In particular, it follows from an analysis of the network of Air France/KLM and the location of its hubs Paris (CDG) and Amsterdam (AMS) that by purchasing OS Air France/KLM would considerably extend its market position towards destinations in Central and Eastern Europe ("CEE"). [...]*.

68 LH's document entitled [...]*.

(104) In contrast, as regards all routes where the transaction would not significantly impede effective competition, the establishment of the proper counterfactual can be left open.

(3) *Conclusion*

(105) The relevant affected markets for air transport of passengers will be assessed both under the counterfactual of the pre-merger situation and under the foreseeable situation whereby OS would be acquired by Air France-KLM, terminate its existing agreements with LH, exit Star Alliance and join SkyTeam where such an assessment is relevant to the question of whether the transaction leads to a significant impediment of effective competition. Ultimately, however, the question as to which of these two counterfactual scenarios constitutes the relevant counterfactual for the assessment of the transaction can be left open, as explained in more detail in the competitive assessment in section VII.

(106) In the assessment in this Decision, the Commission does not take a position on the compatibility of the existing co-operation agreements with Article 81 of the Treaty. The Commission cannot be required to accept pre-merger co-operation between the parties that is contrary to Article 81 of the Treaty as a counterfactual.⁶⁹ As the competition concerns identified in this case will be eliminated as a result of the Commitments offered by the parties, it is not necessary for the purposes of this Decision to further discuss the compatibility of the pre-merger co-operation between the parties with Article 81 of the Treaty.

VII. COMPETITIVE ASSESSMENT

A. Scheduled passenger air transport services

(107) The transaction gives rise to a number of horizontal overlaps that can be grouped in several categories:

- (i) 23 short-haul routes between Austria and Germany, which are served under the parties' cost and profit sharing joint venture;
- (ii) three short-haul routes between Austria and Switzerland;
- (iii) one short-haul route between Austria and Kingdom of Belgium;
- (iv) one short-haul route between Austria and the United Kingdom of Britain and Northern Ireland;

⁶⁹ In the context of merger control, if the illegality of a pre-merger agreement between the parties could not be taken into account, the parties could argue that there would only be a small reduction or even no reduction of competition as a result of the merger. A merger decision in such circumstances would effectively incorporate and perpetuate the pre-merger illegality forever, since mergers that are approved under the Merger Regulation are no longer challengeable under Article 81 of the Treaty, see paragraph 42 and footnote 30 of the Commission's decision in Case No. COMP/M.5403 – Lufthansa/BMI as well as paragraph 263 and footnote 265 of the Commission's decision in Case No. COMP/M.5335 – Lufthansa/SN Airholding.

(v) "direct-indirect overlaps" (namely routes where one party offers a direct connection while the other party offers an indirect connection); and

(vi) "indirect-indirect overlaps" (namely routes where both parties only offer indirect services).

(1) Routes between Austria and Germany

a. The Vienna-Stuttgart route

(108) Approximately [300 000 – 350 000]* passengers travel on the Vienna-Stuttgart route ("VIE-STR") annually, of which approximately [250 000 - 300 000]* passengers fly from point to point ("O&D" passengers), while the remaining are transfer passengers. According to surveys conducted by the parties, up to [50-60]*% of the passengers on the VIE-STR route travel for business purposes.

(109) VIE-STR is served by both OS (through Tyrolean) and LH (through Contact Air and City Line). In addition, 4U, which is controlled by LH, operates VIE-STR. LH operates three daily frequencies on weekdays on VIE-STR (22 weekly frequencies), on which OS code-shares. OS (through Tyrolean) operates three daily frequencies (18 weekly frequencies), on which LH code-shares. 4U operates two to three daily frequencies (16 weekly frequencies). Currently no other airline operates this route. Air Berlin discontinued its operations on VIE-STR in May 2008. The notifying party submits that, as regards inter-modal competition, train services do not represent a significant constraint on air travel on this route.

(110) As regards airport substitutability, the parties maintain that VIE airport and BTS airport should be considered as substitutable. BTS airport is situated 87 km from Vienna city centre, which corresponds to a driving time of more than 60 minutes by car and 75-95 minutes by bus. The parties' contention that BTS airport would be substitutable for VIE airport has not been confirmed by the market investigation in this case. However, given that no airline is currently serving Stuttgart airport ("STR airport") out of BTS airport, it is not necessary to determine whether BTS airport is substitutable with VIE airport for the purpose of serving STR airport.

(111) The table below illustrates the market structure of VIE-STR during the IATA Summer season 2008 and the Winter season 2008/2009.

Airline	SS 08 figures on VIE-STR		WS 08/09 figures on VIE-STR	
	Time Sensitive	All passengers	Time Sensitive	All passengers
LH	[10-20]*%	[10-20]*%	[10-20]*%	[10-20]*%
OS	[10-20]*%	[10-20]*%	[5-10]*%	[10-20]*%
4U	[60-70]*%	[60-70]*%	[70-80]*%	[70-80]*%
Combined	100%	100%	100%	100%

Source: MIDT data provided by the notifying party. Unless indicated otherwise, all market shares mentioned hereinafter are MIDT data (or estimates on the basis of MIDT data) provided by the notifying party.⁷⁰

- (112) VIE-STR was subject to commitments under the Commission's 2002 exemption Decision concerning the joint venture agreement as described in paragraphs (65) et seq. Furthermore, in its Lufthansa/Eurowings Decision, the Commission approved LH's acquisition of 4U subject to commitments on VIE-STR. The commitments included slot releases at VIE airport and STR airport within 30 minutes from the initial request by the new entrant and other ancillary remedies. These commitments are still in place.
- (113) The parties submit that due to their co-operation under the joint venture agreement, LH and OS do not currently compete on this route. They further submit that the overlaps between OS and 4U should not form part of the Commission's assessment as they have already been analysed in the Lufthansa/Eurowings case.
- (114) The Commission found in the Lufthansa/Eurowings case that LH and OS did not compete on VIE-STR because of their joint venture agreement. As a consequence, the Commission assessed the effects of a combination of Eurowings and LH, whereby it did not consider OS as a competitor to LH. The Commission thus considered that the transaction would eliminate 4U as LH's only competitor on VIE-STR.
- (115) It should be noted that despite its acquisition by LH, 4U is not a party to LH's joint venture agreement with OS. The market investigation in phase I and II indicated that OS and 4U compete on prices to some extent. This is due to the fact that while LH and OS operate under a joint venture that shares the resulting profits equally, LH is the sole recipient of any profits from 4U's operations. This therefore implies that OS incentives on the one hand and LH group incentives on the other hand are not currently aligned on this route and that difference in incentives will be eliminated by the transaction.
- (116) A clear majority of respondents to the Commission's market investigation consider that there in fact exists residual competition between OS and 4U. Particularly non-time sensitive passengers recognize that both carriers offer attractive prices and schedules, while time sensitive passengers responded that the carriers compete against each other to a more limited extent. Therefore, the transaction will eliminate OS as 4U's actual competitor. Given that after the transaction both 4U and OS will belong to LH, the transaction leads to a monopoly on VIE-STR.

⁷⁰ LH estimated market shares for some air carriers, whose bookings are not reflected in MIDT (like 4U, Niki, SkyEurope etc.) based on data published by the German Statistical Office and other publicly available information about schedules, frequencies and utilized aircraft, see paragraphs 336-347 of the Form CO. The parties did not consistently provide estimates for all airlines which are only partly covered by MIDT.

- (117) The transaction also raises competition concerns under the alternative counterfactual scenario, whereby OS is acquired by Air France-KLM. Given that both OS and 4U are presently competing on this route to some extent, it can be expected that this actual competition would be even more intensive if OS terminated its joint venture agreement with LH relating to VIE-STR as LH would then not be in a position to influence OS' pricing strategy relating to this route. This is further supported by internal OS documents which indicate that OS would keep operating on this route even in the case of a down-sizing in a stand alone scenario.⁷¹ In that scenario, OS would not only compete against 4U but also against LH.
- (118) In terms of barriers to entry, VIE airport is a level 3 coordinated airport with slot shortage during peak times. Peak times have been indicated as 08.30-11.00 and 16.00-20.45. In the IATA Winter season 2008/2009, runway capacity has also been exhausted in the mornings (as early as 07.35 until 11.50), with capacity being almost full as early as 06.00. In some cases, slot requests by new entrants could only be accommodated within 80 minutes of the initial slot request. The capacity situation at VIE airport is not expected to change within the next three years. LH and OS have been allocated up to 67% of peak time slots at VIE airport.
- (119) With regard to STR airport, which is a coordinated airport, runway capacity constraints also exist during peak times, which are between 08.00-11.00. These constraints are predicted to remain unchanged in the short to medium term.
- (120) It follows that entry barriers, in particular slot constraints at VIE airport and STR airport, render market entry difficult on the VIE-STR route. Additionally several respondents indicated that the transaction will have a negative impact on the entry plans of competitors on VIE-STR.
- (121) It is concluded from the above that regardless of the exact market definition, the transaction raises serious doubts as to its compatibility with the common market on VIE-STR.

b. Vienna-Cologne

- (122) On the Vienna-Cologne route ("VIE-CGN"), over [250 000 – 300 000]* passengers travel every year, of which some [250 000 – 300 000]* are O&D passengers. According to a study conducted by OS, the share of business passengers on this route is about [40-50]*% while [50-60]*% are leisure passengers.
- (123) VIE-CGN is served by OS (through Tyrolean). LH does not operate VIE-CGN itself but markets seats on OS-served flights under a code-share with OS. In addition, 4U (which is indirectly controlled by LH) operates on VIE-CGN. OS operates three daily frequencies on weekdays (18 weekly frequencies) and 4U operates three daily frequencies on weekdays (20 weekly frequencies). Apart from OS and 4U, no other carrier operates this route. TUIfly

⁷¹ OS' presentation [...]*.

started marketing its operations on the CGN-VIE route as of 31 August 2009 with two frequencies on weekdays and with one frequency each on Saturdays and Sundays. These flights are also available for booking in the upcoming IATA Winter season 2009/2010. However, TUIfly's City Carrier Business is in the process of being sold to Air Berlin and it is therefore uncertain whether or not VIE-CGN will be actually served if the transaction between TUIfly and Air Berlin is completed. The notifying party submits that train services do not represent a significant constraint on air travel on this route.

- (124) As regards airport substitutability, the parties submit that CGN airport and DUS airport should be considered as substitutable. It should be noted that the distance from DUS airport to the city centre of Cologne is approximately 61 km, which amounts to travel time of slightly more than 40 minutes by car or train. However, as explained in paragraph (15), the distance between airports can only serve as a first "proxy" to define a catchment area; a more detailed analysis is necessary on a case-by-case basis.
- (125) On the demand side, a considerable number of respondents to the Commission's market investigation indicated that CGN airport and DUS airport would not be substitutable for time sensitive passengers. In addition, the Commission also obtained pricing data on a number of common destinations that LH serves from DUS airport and CGN airport, and the resulting movement of fares for flights that originate out of DUS airport and CGN airport is in many instances not consistent with both of those two airports belonging to the same market.
- (126) On the supply side, LH operates on a number of routes out of both airports (including CGN-VIE and DUS-VIE) thereby meeting a specific demand on each of these airports. In addition, there are significant slot constraints at DUS airport unlike at CGN airport (a facilitated airport), which contradicts the idea that the competitive landscape is sufficiently homogenous between the two airports. For the purposes of this Decision, it is therefore concluded that DUS airport cannot be regarded as a substitute to CGN airport, at least for time sensitive passengers travelling on the CGN-VIE route.
- (127) The table below illustrates the market structure of VIE-CGN in the IATA Summer season 2008 and IATA Winter season 2008/2009.⁷²

Airline	SS 08 figures on VIE-CGN		WS 08/09 figures on VIE-CGN	
	Time Sensitive	All passengers	Time Sensitive	All passengers
LH	[5-10]*%	[0-5]*%	[5-10]*%	[0-5]*%
OS	[5-10]*%	[5-10]*%	[5-10]*%	[5-10]*%
4U	[80-90]*%	[80-90]*%	[80-90]*%	[80-90]*%
Others	[0-5]*%	[0-5]*%	0%	0%
Combined	100%	100%	100%	100%

⁷² LH estimated market shares for some air carriers, whose bookings are not reflected in MIDT (like 4U, Niki, SkyEurope etc.) based on data published by the German Statistical Office and other publicly available information about schedules, frequencies and utilized aircraft, see paragraph 336-347 of the Form CO. The parties did not consistently provide estimates for all airlines which are only partly covered by MIDT.

- (128) Similarly to VIE-STR, VIE-CGN was also subject to commitments in the Commission's 2002 exemption decision and commitments still apply according to the Commission's Lufthansa/Eurowings decision.
- (129) The parties submit that due to their co-operation under the joint venture agreement, LH and OS do not currently compete on this route. They further submit that the overlaps between OS and 4U should not be assessed due to the fact that they were analysed in the Lufthansa/Eurowings case.
- (130) The Commission found in the Lufthansa/Eurowings case that LH and OS did not compete on VIE-CGN due to their joint venture agreement. As a consequence, the Commission assessed the effects of a combination of Eurowings and LH, whereby it did not consider OS as a competitor to LH. The Commission considered that the transaction would eliminate 4U as LH's only competitor on VIE-CGN.
- (131) It should be noted that despite its acquisition by LH, 4U is not a party to LH's joint venture agreement with OS. The market investigation in phase I and II has indicated that OS and 4U compete to some extent on prices. This is due to the fact that while LH and OS are operating under a joint venture that shares the resulting profits equally, LH is the sole recipient of any profits from 4U's operations. This therefore implies that LH's and OS' incentives are currently not aligned on this route and this difference in incentives will be eliminated by the transaction.
- (132) A clear majority of respondents to the Commission's market investigation consider that there is in fact residual competition between OS and 4U. Particularly non-time sensitive passengers recognize that both carriers offer attractive prices and schedules, while time sensitive passengers responded that the carriers compete against each other to a more limited extent. Therefore, the transaction will eliminate OS as 4U's actual competitor. Given that after the transaction both 4U and OS will belong to LH, the transaction would lead to a monopoly on VIE-STR.
- (133) As regards TUIfly's plans to start operations on VIE-CGN, it is not yet clear what, if any, competitive constraint TUIfly will exercise on the parties given that TUIfly's City Carrier Business is in the process of being sold to Air Berlin and it is uncertain whether this route will be actually operated on once the transaction between TUIfly and Air Berlin is completed. In any event, the announced entry of TUIfly on a route that would become a monopoly route post merger, is not sufficient to dismiss serious doubts regarding this route.
- (134) The transaction also raises competition concerns under the alternative counterfactual scenario, whereby OS is acquired by Air France-KLM. Given that both OS and 4U are presently competing on this route some extent, it can be expected that this actual competition would be even more intensive if OS terminated its joint venture agreement with LH relating to VIE-CGN as LH would then not be in a position to influence OS' pricing strategy relating to this route. This is further supported by internal OS documents which indicate that OS would keep operating on this route even in the case of down-sizing in a

stand alone scenario.⁷³ In that scenario, OS would not only compete against 4U but also against LH.

- (135) Entry barriers exist on VIE-CGN as a result of significant slot constraints at VIE airport, as described in detail in paragraph (118). CGN airport is a schedules facilitated rather than coordinated and there are no material slot constraints in CGN.
- (136) It is concluded from the above that the transaction raises serious doubts as to its compatibility with the common market at least with regard to time sensitive passengers on VIE-CGN. It is not necessary to conclude whether or not the transaction raises serious doubts on a possible market for non-time sensitive passengers or the market comprising all passengers travelling on VIE-CGN given that the Commitments proposed by LH address competition concerns under any alternative market definition.

c. Vienna-Munich

- (137) On the Vienna-Munich route ("VIE-MUC") [350 000 – 400 000]* passengers travel annually, out of which some [200 000 – 250 000]* are O&D passengers, the rest being transfer passengers. The parties estimate that up to [60-70]*% of passengers on this route travel for business purposes.
- (138) VIE-MUC is served by both OS (through OS and Tyrolean) and LH (through LH and Cityline). Additionally, the parties market seats on each other's flights. OS (together with Tyrolean) operates four daily frequencies on weekdays (26 weekly frequencies), LH (together with Cityline) operates five daily frequencies on weekdays (33 weekly frequencies). The only other air carrier active on this route is Niki Luftfahrt GmbH ("Niki"), with three daily frequencies on weekdays (17 weekly frequencies), which began operating flights on the route in November 2007 and was granted slots through the normal slot allocation procedure. Air Berlin code-shares on Niki's services. Deutsche Bahn and ÖBB offer an average of 6 daily direct train connections (ICE/IC) between Vienna (Westbahnhof) and Munich (Hauptbahnhof) with a duration of 4.10-4.17 and a number of indirect one-stop connections.
- (139) The table below illustrates the market shares of air carriers active on VIE-MUC in the IATA Summer season 2008 and Winter season 2008/2009 estimated by the parties according to the MIDT data.⁷⁴

⁷³ OS' presentation [...]*.

⁷⁴ LH estimated market shares for some air carriers, whose bookings are not reflected in MIDT (like 4U, Niki, SkyEurope etc.) based on data published by the German Statistical Office and other publicly available information about schedules, frequencies and utilized aircraft, see paragraph 336-347 of the Form CO. The parties did not consistently provide estimates for all airlines which are only partly covered by MIDT.

Airline	SS 08 figures on VIE-MUC		WS 08/09 figures on VIE-MUC	
	Time Sensitive	All passengers	Time Sensitive	All passengers
LH	[50-60]*%	[30-40]*%	[40-50]*%	[30-40]*%
OS	[20-30]*%	[20-30]*%	[20-30]*%	[10-20]*%
Combined LH+OS	[70-80]*%	[50-60]*%	[70-80]*%	[50-60]*%
Niki	[20-30]*%	[40-50]*%	[20-30]*%	[30-40]*%
Air Berlin	[0-5]*%	[0-5]*%	[0-5]*%	[10-20]*%
Others	[0-5]*%	[0-5]*%	[0-5]*%	[0-5]*%
Combined all	100%	100%	100%	100%

(140) On the basis of the market investigation the Commission has endeavoured to reconstruct the market for all passengers for the IATA Summer season 2008 and Winter season 2008/2009. The market shares are based on figures of flown passengers provided by the parties and Niki.⁷⁵

Figures on VIE-MUC: all passengers		
Airline	SS 08	WS 08/09
LH	[30-40]%	[30-40]%
OS	[20-30]%	[20-30]%
Combined LH+OS	[60-70]%	[50-60]%
Niki ⁷⁶	[30-40]%	[40-50]%
Combined all	100%	100%

(141) With respect to inter-modal competition, the parties consider that train services on VIE-MUC should be seen as a viable competitive alternative to flights on this O&D city pair and should therefore be included in the market. The parties estimate that some [60 000 – 70 000]* O&D passengers travel yearly on VIE-MUC by train, out of which around [10 000 – 20 000]* passengers are time sensitive. According to the parties' estimates, if train services are included in the relevant market, train passengers would account for around [20-30]*% of all passengers on this route ([20-30]*% of time sensitive passengers) and the parties' combined market share would total [40-50]*% ([50-60]*% for time sensitive passengers). In such a scenario, the parties estimate Niki's market share would be [10-20]*% for time sensitive passengers and [30-40]*% for all passengers.

(142) The market investigation has, however, shown that given the short total travel time by plane on VIE-MUC, the train service does not a viable alternative for time sensitive passengers. The parties estimate the total travel time by plane to be 3.10 to 3.25. Even if the parties' assumptions were taken as a basis for comparison, the total travel time by plane is considerably less than the train journey alone of 4.10 to 4.17 (even using the city centre as a benchmark, that is, ignoring the journey to/from the train station, boarding the train etc.⁷⁷).

75 The comparability of the data collected in the market investigation from different companies may be affected by possibly different methods of data collection. In particular, the parties provided various sets of "flown passenger data".

76 Including Air Berlin's passengers.

77 Since for most travellers the train station is not their real point of origin or destination, a realistic total travel time by train should also include the average travel time between the train station and the real point of origin and destination. In a large city (like Vienna and Munich), this travel time is likely to amount to at least 20

Indeed, a clear majority of respondents did not consider train services to be a credible alternative for time sensitive passengers on this route. They consider the travel time to be too long and the cost saving in terms of ticket prices not sufficient to compensate for the longer travel time. As pointed out by respondents to the market investigation, train services on this route also do not cater for typical one day return business trips due to the train's late arrival in the morning and early departure in the evening. Where a time sensitive passenger needs to attend a morning meeting in one of the two cities, the earliest arrival time in Vienna (Westbahnhof) of a non-stop train is 11.40 and 10.31 in Munich (Hauptbahnhof). By that time, four planes operated by the parties have already landed at VIE airport and two planes operated by the parties have already landed at MUC airport.

- (143) As regards non-time sensitive passengers, the views of the respondents to the Commission's market investigation questionnaires on the substitutability between plane and train services on this route were rather varied.
- (144) In addition to the qualitative market investigation, the Commission also obtained pricing data from Deutsche Bahn on the MUC-VIE route to compare them with the fares of OS and LH. OS' and LH's average fully-flexible economy and unrestricted business fares are more than three times as expensive as Deutsche Bahn's average fully-flexible first-class fares. OS' and LH's average semi-flexible economy fares are more than twice as expensive as Deutsche Bahn's average fully-flexible second-class fares. Even OS' and LH's average non-flexible economy fares are more than [50-60]*% more expensive than Deutsche Bahn's average fully-flexible second-class fares. These considerable price differences suggest that train travel cannot be considered as a close competitor to air travel, particularly for time sensitive passengers.
- (145) As regards the relevant counterfactual, VIE-MUC is one of the routes where LH and OS operate under the joint venture agreement, according to which all revenues and costs incurred in connection with the operation of this route are shared between LH and OS. The market investigation revealed that the current competition between the parties on this route is at the most rather limited. In fact, the main consequence of the creation of a permanent structural link between the parties is the elimination of potential competition between them on the VIE-MUC route. However, the question whether the creation of a permanent structural link between LH and OS as such significantly impedes effective competition on the common market due to the elimination of potential competition between the parties can be left open since, in any event, the transaction raises serious doubts as to its compatibility with the common market under the Air France-KLM counterfactual scenario whereby OS is acquired by Air France/KLM and subsequently terminates its co-operation with LH, and the Commitments proposed by LH solve competition concerns under each alternative counterfactual scenario.

minutes. Equally, boarding/arrival times for train services should also be taken into account. Although there is no check-in for ICE services, travellers need around 10 minutes to go from the station entrance to the train and also around 10 minutes to disembark and reach the station exit; see Case No. COMP/M.5335 – Lufthansa/SN Airholding, paragraph 121.

- (146) First of all, VIE-MUC is a thick route with a large number of O&D and transfer passengers. Currently, LH and OS both operate a significant number of frequencies on VIE-MUC and MUC airport is a hub for LH, while VIE airport is a hub for OS. Given the specific features of this route and the fact that OS and LH are both presently active on this route, it is reasonable to assume that both carriers would maintain those operations if OS terminated its joint venture agreement with LH. This scenario is supported by internal OS documents that indicate that OS would keep operating on the VIE-MUC route even in the case of down-sizing in a stand alone scenario.⁷⁸ As this route is already served by more than one (network-) carrier pre-merger, it is reasonable to assume that demand on the route will stay sufficiently large for more than one (network-) carrier to sustainably operate on this route regardless of whether these carriers belong to the same alliance or not. Secondly, according to the Air France-KLM counterfactual scenario, for the two alliances to be able to compete effectively for traffic to/from their respective hubs, both LH and OS would probably have to maintain, if not increase, the frequencies of their flights. In fact, as noted at paragraph (103), LH's internal documents indicate that LH would need to add [...] weekly frequencies on VIE-MUC if OS is acquired by Air France-KLM and joins SkyTeam. On that basis, the proposed concentration would eliminate actual or at least potential competition between the parties.
- (147) The market investigation (including quantitative and qualitative evidence) shows that the remaining competition from Niki on VIE-MUC would not sufficiently constrain the merged entity to prevent anti-competitive effects at least for time sensitive passengers. Moreover, it is clear from paragraphs (142) to (144) above that train services cannot be considered a credible alternative to air transport for time sensitive passengers on this route, while the same train services seem to exert some competitive constraint on non-time sensitive passengers.
- (148) A majority of respondents do not consider the presence of Niki a sufficient competitive constraint on the parties. In particular, Niki is not perceived as a credible alternative to the LH/OS merged entity in terms of its flight times and the number of frequencies it offered for time sensitive passengers. Several respondents indicated that the parties have an important competitive advantage vis-à-vis Niki on VIE-MUC due to their higher number of flight frequencies. In addition, some respondents considered the morning departure time from VIE airport (6.15; arrival at MUC airport at 7.20) offered by Niki as too early and the evening departure from MUC airport (21.30; arrival at VIE airport at 22.35) as too late, and thus inconvenient for business travellers.⁷⁹ Moreover, several respondents concluded that a competitor (such as Niki) would need to offer at least four frequencies on VIE-MUC to be able to offer a sufficiently attractive schedule for time sensitive passengers.
- (149) The results of the market investigation, finding that Niki does not sufficiently constrain OS/LH at least as far as time sensitive passengers are concerned, are also supported by the data analysis that was based on the pricing data obtained from the parties which assessed the

78 OS' presentation [...]*.

79 This evidence is supported by the fact that, according to the Commission's market investigation, time sensitive passengers have a very clear preference for morning departures after 7.00 and return flights in the evening between 18.00 and 19.00 (not later than 21.00).

effect of Niki's November 2007 entry on the parties' prices. The analysis suggests that Niki's entry in November 2007 had no impact at least on LH's and OS' fares for time sensitive passengers. This evidence supports the finding that, at least in the case of time sensitive passengers, Niki does not constitute a strong constraint on the parties.

(150) The Commission further found that with respect to tickets purchased close to the flight date which appear to be purchased by time sensitive passengers, Niki's position is considerably weaker than LH's and OS' and than estimated by the parties in their notification. The Commission further found that LH and OS charge significantly higher fares than Niki to passengers booking close to the flight date. These large price differences are further evidence that Niki is not viewed as a close competitor by time sensitive passengers, as the parties can extract significantly higher rents than Niki thanks to more flight frequencies and more convenient schedules.

(151) With regard to barriers to entry, although Niki managed to obtain three frequencies on VIE-MUC in 2007, there currently remain considerable barriers to entry or expansion for competitors in particular for time sensitive passengers, who require a larger number of frequencies at convenient times. Significant slot constraints exist at VIE airport (paragraph (118)) as well as at MUC airport. In the most recent IATA season, capacity was exhausted at MUC airport between 06.00-10.00 and 15.00-22.00 of any given weekday. Indeed, time sensitive passengers have a very clear preference for morning departures after 7.00 and return flights in the evening between 18.00 and 19.00 (and not later than 21.00). Given that these are precisely the times when capacity at MUC airport is exhausted, competitors currently face significant barriers to entry or to expansion should they want to offer a credible service catered to time sensitive passengers. This situation will remain unchanged until at least 2011.⁸⁰

(152) In conclusion, therefore, the proposed transaction raises serious doubts as to its compatibility with the common market under the Air France-KLM counterfactual at least for time sensitive passengers on VIE-MUC. It is not necessary to determine whether or not the transaction raises serious doubts on a possible market for non-time sensitive passengers or the market comprising all passengers travelling point-to-point on VIE-MUC given that the Commitments proposed by LH address any competition concerns under an alternative market definition.

d. Vienna-Frankfurt

(153) On the Vienna-Frankfurt route ("VIE-FRA"), [400 000 – 450 000]* passengers travelled point-to-point in 2008. Over [600 000 – 650 000]* passengers travelled on this route when transfer passengers are included. The parties estimate that up to [50-60]*% of passengers travel for business purposes on VIE-FRA.

⁸⁰ It should be noted that MUC airport expects significant capacity extensions to be in place as of 2011. In particular, a third runway is currently in the second phase of an extensive approval process and is expected to be operational as of 2011. This third runway will increase co-ordination of up to 120 movements per hour compared to 90 movements per hour with the existing two-runway system and will be available to both terminals at MUC airport.

- (154) Both OS (through OS and Tyrolean) and LH operate on VIE-FRA. The parties market seats on each other's flights. Additionally, Adria Airways, a Star Alliance member based in Slovenia operates flights on this route, on which LH code shares.⁸¹ The other competitors are Niki and Air Berlin. Air Berlin merely code-shares on Niki's services. Currently, those carriers have the following number of flight frequencies: LH and OS – five daily frequencies each (35 weekly each), Adria Airways – three daily frequencies (16 weekly); Niki – two daily frequencies (11 weekly).
- (155) Frankfurt is served by two airports: FRA airport and HHN airport. OS, LH, Adria Airways and Niki fly from VIE airport to FRA airport. Ryanair (FR) currently operates three weekly frequencies between BTS airport and HHN airport. The parties consider that FR exerts at least some competitive pressure on them, particularly in relation to non-time sensitive passengers. Based on the results of the market investigation, the Commission considers that FR's services do not constrain the parties on VIE-FRA to any meaningful degree, regardless of whether there is a separate market for time sensitive passengers or not. First, given the considerable distance from Vienna to BTS airport and from Frankfurt to HHN airport, the total travel time is much longer than a trip involving VIE airport and FRA airport. BTS airport is situated 87 km from Vienna city centre, which corresponds to a driving time of more than 60 minutes by car and 75 to 95 minutes by bus. Bus connections are generally infrequent; notably there are only three 75 minute-bus connections on Vienna-BTS airport daily. HHN airport is situated 124 km from Frankfurt city centre, which corresponds to 85 minutes by car and 105 minutes by bus. Secondly, respondents to the market investigation in this case did not consider BTS airport a substitute for VIE airport, at least in relation to time sensitive passengers. Moreover, the majority of respondents did not consider HHN airport to be a substitute for FRA airport, even in relation to non-time sensitive passengers. Lastly, the parties have not provided any data in support of their contention that FR should be regarded as their competitor on VIE-FRA despite the Commission's repeated request for the parties' data and estimates as to the structure of the market comprising carriers active on VIE airport-FRA airport as well as BTS airport-HHN airport.
- (156) As regards inter-modal competition, the notifying party submits that train services do not represent a significant constraint on air travel on this route.
- (157) The table below provides the market shares of air carriers active on the VIE-FRA route in the IATA Summer season 2008 and Winter season 2008/2009 estimated by the parties according to the MIDT data.⁸²

81 The code-share agreement between LH and Adria Airways is a standard free-flow code-share agreement.

82 LH estimated market shares for some air carriers, whose bookings are not reflected in MIDT (like 4U, Niki, SkyEurope etc.) based on data published by the German Statistical Office and other publicly available information about schedules, frequencies and utilized aircraft, see paragraph 336-347 of the Form CO. The parties did not consistently provide estimates for all airlines which are only partly covered by MIDT.

Airline	SS 08 figures on VIE-FRA		WS 08/09 figures on VIE-FRA	
	Time Sensitive	All passengers	Time Sensitive	All passengers

(i) Competitive assessment of creation of permanent structural link between the parties

(159) As regards the relevant counterfactual, VIE-FRA is one of the routes where LH and OS operate under the joint venture agreement, according to which all revenues and costs incurred in connection with the operation of this route are shared between LH and OS. The market investigation revealed that the current competition between the parties on this route is at most rather limited. In fact, a consequence of the creation of a permanent structural link between the parties would be the elimination of potential competition between them on the VIE-FRA route.

(160) However, it is to be recalled that the parties' joint venture was temporarily exempted by the Commission under Article 81(3) of the Treaty subject to commitments. When the Commission's 2002 exemption Decision expired in 2005, the parties continued their joint venture co-operation based on a self-assessment of the compliance with Article 81 of the Treaty of their co-operation.

(161) The self-assessment conducted by the parties of the compliance with Article 81 of the Treaty of their co-operation categorises the VIE-FRA route as a route with a "high" risk

⁸³ The comparability of the data collected in the market investigation from different companies may be affected by possibly different methods of data collection. In particular, the parties provided various sets of "flown passenger data".

⁸⁴ Including Air Berlin's passengers.

grade, that is, according to the parties' assessment, that "serious concerns" regarding its compatibility with Article 81 of the Treaty exist on this route. The self-assessment thus concludes that it is "very likely" that slots will need to be transferred to competitors and that the transfer of three to four slots following a request by another airline, possibly in combination with further measures, is therefore necessary in order to remove these competition concerns.⁸⁵

(162) On the basis of that self-assessment, LH transferred two slots at Frankfurt airport to its competitor Niki in 2006, so as to enable Niki to enter VIE-FRA with two daily frequencies. In July 2009, LH transferred a further slot to Niki, so as to enable Niki to operate a third frequency on VIE-FRA as of the IATA winter season 2009/2010.⁸⁶ The relevant slot lease agreements between LH and Niki are unlimited in time but will end, with the result that Niki will have to hand back the Frankfurt slots to LH, if the joint venture between LH and OS is terminated.⁸⁷ Moreover, following the completion of the proposed acquisition of OS by LH, namely, when OS and LH belong to the same group, Article 81 of the Treaty will cease to be applicable to the parties' pre-merger co-operation under the joint venture agreement and therefore the underlying reason for the slot transfer to Niki for VIE-FRA will no longer exist. As a consequence of the proposed transaction, the joint venture between the parties will likely cease to exist and, in any event, the decision whether or not to terminate the joint venture will be fully with LH. The transaction will thus not only convert the parties' contractual co-operation into a permanent structural link, eliminating potential competition between the parties on VIE-FRA, but it will also allow LH to terminate the slot lease agreements with Niki.

(163) As a result of the termination of the slot lease agreements, Niki would effectively have to exit the VIE-FRA route. Indeed, the market investigation revealed that FRA Airport is congested throughout the day and that access to requested slots is therefore virtually impossible. Niki would thus not only have to return its current slots to LH but would also have difficulty obtaining any own slots at all due to the congestion at FRA airport, and even less any morning and evening slots, under the normal slot allocation procedure. The transaction would thus eliminate the parties' most important competitor on VIE-FRA. In view of the elimination of actual competition from a third party, the extent to which the creation of a permanent structural link between the parties also leads to the elimination of potential competition between them on VIE-FRA can be left open.

(164) Therefore, the only remaining competitor on the VIE-FRA route would be Adria Airways, which would not sufficiently constrain the parties to counterbalance the elimination of Niki as an actual competitor.

(165) The parties submit that Adria Airways should be regarded as a competitor on this route as the code-share agreement between LH and Adria Airways does not provide for price

85 See "LH/AUA Self-Assessment", pp. 4, 13 and 14.

86 See "Annex Update Agreement" of 29 June 2009.

87 According to section 9 of the slot lease agreement between LH and Niki, the agreement will be terminated when Niki transfers all of LH's slots back to LH. According to section 10 of the slot lease agreement, Niki is obliged to return LH's slots if the joint venture between LH and OS is terminated.

coordination. However, the Commission considers that Adria Airways, a Star Alliance member, cannot be considered as exercising a strong constraint, if one at all, on the merged entity.

- (166) Despite its 16 weekly frequencies and the fact that it has been operating on this route for several years now (Adria Airways entered VIE-FRA in the IATA Winter season 2001/2002), Adria Airways has never gained a meaningful market share of this route and currently accounts for about [0-5]% of the market. This is because it uses small aircraft and its load factor is relatively low ([50-60]-[60-70] %). Furthermore, it is to a large extent dependent on LH for its customer base, illustrated by the high percentage of passengers it transports with a ticket issued by LH. It is thus clear that Adria Airways, at best, exercises a limited competitive constraint upon the parties, as is also illustrated by the statements of respondents to the Commission's market investigation. Several respondents pointed out that Adria Airways does not compete on prices with LH/OS but, rather, that its prices are adjusted to match those of LH. Some respondents consider that this is due to the code-share agreement with LH, others think that the underlying reason might be that Adria Airways participates in LH's Partner Plus contracts with corporate customers. As a consequence, several respondents perceive Adria Airways' service as an additional LH service rather than an independent service offered by a competitor. It is pointed out that some corporate customers/travel agents whose employees/customers fly on VIE-FRA are not even aware of the presence of Adria Airways on this route or the proportion of their bookings with Adria Airways is very low (below 5%). In addition, Adria Airways is considered by some respondents to offer an inferior level of on board service, low capacity and a relatively unattractive schedule.
- (167) Moreover, even if the presence of Adria Airways on this route is considered a constraint, it is not clear to what extent Adria Airways will be able to operate on VIE-FRA in the future. Since the IATA Winter season 2006, LH has been granting slots for Adria Airways' operations on a season-by-season basis. The initial Slot Exchange Agreement between LH and Adria Airways was terminated in July 2006 and, since then, LH and Adria Airways have entered into a Slot Exchange Renewal Agreement in advance of every season. Since there is no longer a long-term slot lease agreement with LH in place, LH can withdraw slots from Adria Airways after every season. Given that slot capacity at FRA airport is exhausted throughout the entire day, it is doubtful whether Adria Airways would be able to continue offering its VIE-FRA service if LH withdraws slots from Adria Airways.
- (168) Taking into account the fact that Adria Airways is largely dependent on LH to fill its planes due to its low load factor, its low market share, the results of the market investigation that dismiss Adria Airways as an important source of competition on the VIE-FRA route, and the uncertainty of how long Adria Airways will operate on the route, it is clear that this marginal player cannot sufficiently constrain LH/OS.
- (169) It must therefore be concluded that the creation of a permanent structural link between LH and OS as a result of the proposed concentration raises serious doubts as to its compatibility with the common market on VIE-FRA.

(ii) Competitive assessment of the proposed concentration under the Air France-KLM counterfactual

- (170) Moreover, the transaction raises serious doubts as to its compatibility with the common market under the Air France-KLM counterfactual scenario whereby OS is acquired by Air France-KLM. The acquisition of OS by Air France-KLM would likely lead to the termination of the joint venture agreement between LH and OS and in case of the termination of the joint venture agreement, the relevant slot lease agreements between LH and Niki will come to an end and consequently, Niki will have to return the Frankfurt slots to LH.⁸⁸ As a result of the termination of the slot lease agreements, Niki would effectively have to exit the route, given that FRA airport is congested throughout the day and that access to requested slots is therefore virtually impossible. Niki would thus not only have to return its current slots to LH, but would also have difficulty obtaining any own slots under the normal slot allocation procedure.
- (171) On the other hand, the evidence available to the Commission suggests that, under the Air France-KLM counterfactual, both LH and OS would likely operate the VIE-FRA route in competition with each other.
- (172) First of all, VIE-FRA is a thick route (in fact the thickest route affected by this transaction), with a large number of O&D and transfer passengers travelling in both directions and with a large proportion of business travellers. As this route is served by more than one (network-) carrier already pre-merger, it can generally be assumed that it is sufficiently large for more than one (network-) carrier to sustainably operate it.
- (173) Secondly, both LH and OS already operate a significant number of frequencies on VIE-FRA. Given the features of this route and the fact that OS and LH are presently both active on this route, it can be expected that both carriers would maintain their operations if OS terminated its joint venture agreement with LH. This is supported by internal OS documents which indicate that OS would continue operating on the VIE-FRA route even in the case of down-sizing in a stand alone scenario.⁸⁹ In the Air France-KLM counterfactual scenario, for the two alliances to be able to compete effectively against each other, both LH and OS would not only have to continue operating flights in competition on this route in order to attract traffic to/from their respective hubs but also they would probably even increase their frequencies. Indeed, as noted in paragraph (103), LH's internal documents indicate that LH would need to add [...] weekly frequencies on VIE-FRA, if OS is acquired by Air France-KLM and joins Sky Team.
- (174) On the basis of this counterfactual scenario, the proposed concentration would thus eliminate actual or at least potential competition between the parties.

⁸⁸ According to section 9 of the slot lease agreement between LH and Niki, the agreement will be terminated when Niki transfers all LH's slots back to LH. According to section 10 of the slot lease agreement, Niki is obliged to return LH's slots back to LH if the joint venture between LH and OS is terminated.

⁸⁹ OS' presentation "[...]".

- (175) Therefore, also under this counterfactual, the only remaining competitor on the route would be Adria Airways. However, for the reasons set out in more detail in paragraphs (165) to (168), Adria Airways is unlikely to sufficiently constrain the parties to prevent anti-competitive effects on passengers.
- (176) Moreover, even if Niki were to continue operating its services on the VIE-FRA route under the Air France-KLM counterfactual (*quod non*), the evidence available to the Commission shows that it would not place a sufficient constraint on LH/OS to compensate for the elimination of competition between LH and OS.
- (177) For good measure, the Commission also investigated the constraint that Niki currently places on LH/OS. The market investigation shows that several corporate customers consider that the parties have an unmatched competitive advantage towards Niki on VIE-FRA due to better frequency offering that is particularly valued by time sensitive passengers. In particular, Niki's morning departure from FRA airport (9.40) is considered to be too late and thus inconvenient for time sensitive passengers. This evidence is supported by the Commission's market investigation which revealed that time sensitive passengers have a very clear preference for morning departures after 7.00 and return flights in the evening between 18.00 and 19.00 (not later than 21.00). Moreover, several respondents considered that a competitor (such as Niki) would need to offer at least five frequencies on VIE-FRA in order to be able to offer a sufficiently attractive schedule for time sensitive passengers. In addition, the majority of respondents reported that the proportion of their bookings with Niki on VIE-FRA is around or below 10%, which is consistent with the findings that corporate customers do not view Niki as a credible alternative. Some travel agents also characterize competition from Niki as limited.
- (178) The results of the market investigation are supported by the Commission's pricing analysis that, using the passenger-level data requested from the parties, examined the effect of Niki's entry in October 2006 on the parties' prices on this route. Niki's entry had no effect on OS' and LH's prices for fully flexible business and economy tickets. Somewhat of an impact by Niki's entry was observed in relation to LH's non flexible economy tickets, however less of an impact was noticeable in relation to OS' non flexible tickets. This suggests that Niki does not constitute a strong constraint on the parties at least in relation to time sensitive passengers but probably for all passengers.
- (179) Furthermore, the slots currently held by Niki have several shortcomings: first, Niki's morning slot in Frankfurt is 30 minutes later than Niki's initial slot request. As a result, Niki has inconvenient arrival and departure slots at morning peak times in Frankfurt, as a result of which Niki's morning flight from FRA airport arrives at VIE airport at 10.55. Second, the slot lease agreement between Niki and LH does not provide for grandfathering rights on slots granted to Niki and Niki is required to try to obtain suitable slots at FRA airport from the slot coordinator every season prior to obtaining them from LH. Third, Niki needs to comply with a contractual obligation with LH to use its slots according to the 80%-"use-it or-lose-it rule", while other airlines currently do not need to comply with this rule since the relevant regulation has been suspended for the IATA Summer 2009 season.⁹⁰ Lastly, the slot

⁹⁰ See paragraph (384) below.

lease agreement with Niki foresees very high penalties if a slot is lost and no obligation for LH to safeguard LH's grandfathering rights with regard to slots leased to Niki exists. These shortcomings translate into less flexibility of Niki to respond to changes in passenger demand. Consequently, Niki has a significant competitive disadvantage vis-a-vis the parties.

(180) In addition, given that slot capacity at FRA airport is exhausted throughout the day, it is noted that Niki's entry on VIE-FRA was only possible because LH leased FRA slots to Niki. However, Niki would lose these slots if the parties terminate the joint venture following an acquisition by Air France-KLM as the slot lease agreement between LH and Niki contains a provision whereby LH may terminate that agreement if the joint venture between LH and OS is terminated.

(181) In the course of the Commission's in-depth investigation of the transaction, LH and Niki extended their slot lease agreement to include a third slot at FRA airport at 16.45 (arrival from VIE airport) and 17.25 (departure to VIE airport) as of the IATA Winter season 2009/2010, which will enable Niki to operate three frequencies on VIE-FRA as of the Winter season. The timing of these additional slots is nearly exactly that requested by Niki. The parties claim that this will further increase the already strong competitive pressure exercised by Niki on this route. However, this additional slot will not alter the fact that Niki's morning flight is inconvenient for the purposes at least of time sensitive passengers. Moreover, given the shortcomings of the slot lease agreement between LH and Niki, Niki's competitive pressure stemming from its three operations a day under the current conditions would in any case be limited.

(182) Finally, significant barriers to entry exist on this route, and thus the threat of potential entry cannot discipline OS/LH on this route either. Indeed, the VIE-FRA route is characterised by significant barriers to entry. A first barrier to entry is the congestion of the airports at both ends of the VIE-FRA route. Both VIE airport and FRA airport experience significant levels of congestion. As regards VIE airport, slot shortage exists from 07.35 until 11.50 and from 16.00 to 20.45, as explained in paragraph (118). FRA airport is congested throughout the day and competitors have unanimously indicated that access to requested slots at FRA airport is virtually impossible.

(183) It must therefore be concluded that the proposed concentration also under the Air France-KLM counterfactual, raises serious doubts as to its compatibility with the common market on VIE-FRA.

(iii) Conclusion on the competitive assessment of the transaction regarding VIE-FRA

(184) In conclusion, the proposed transaction raises serious doubts on the VIE-FRA route as to its compatibility with the common market both under the pre-merger situation and under the Air France-KLM counterfactual and regardless of the precise market definition.

e. The Vienna-Berlin, Vienna-Düsseldorf, Vienna-Hamburg, Vienna-Hannover and Vienna-Nuremberg routes

(185) On several routes between Austria and Germany, namely the Vienna-Berlin ([400 000 – 450 000]* O&D and [450 000 – 500 000]* total passengers), Vienna-Düsseldorf ([450 000 – 500 000]* O&D and [500 000 – 550 000]* total passengers), Vienna-Hamburg ([350 000 – 400 000]* O&D and [400 000 – 450 000]* total passengers), Vienna-Hannover ([200 000 – 250 000]* O&D and [200 000 – 250 000]* total passengers) and Vienna-Nuremberg ([100 000 – 150 000]* O&D and [100 000 – 150 000]* total passengers) routes, the parties face significant competition from Air Berlin in particular. Indeed, as is illustrated by the table below for the IATA seasons winter 2008/2009 and summer 2008, no competition concerns arise on these routes as a result of the limited market shares of the parties (below [20-30]*% in all possible markets) and the strong market position of Air Berlin.

	WS 08/09 figures				SS 08 figures

(186) The absence of competition concerns is confirmed by the market investigations both in phase I and phase II which did not reveal any specific substantiated concerns for these routes. Although a few responding travel agents and corporate customers voiced single concerns, with respect to potential price increases and reduction of frequencies for instance, the vast majority of the respondents does not see any impact on the competitive situation on these routes as a result of the transaction.

(187) In phase II, the position of Air Berlin and the closeness of services between LH/OS and Air Berlin on the Vienna-Berlin, Vienna-Düsseldorf, Vienna-Hamburg and Vienna-Hannover routes were further investigated. The vast majority of respondents (both travel agents and corporate customers as well as competitors) clearly indicate that they perceive Air Berlin as a credible alternative to an LH/OS merged entity in terms of the timing and the frequencies of its flights when compared to the timing and frequencies of the LH/OS flights.

This is valid both for time sensitive and non-time sensitive passengers. Concerning the levels of service both at airports and on board, and concerning the frequent flyer programmes ("FFP") offered by LH and OS on the one hand, and by Air Berlin and Niki on the other hand, the opinions of the respondents have been varied. One group of respondents considered the services offered by Air Berlin inferior to those offered by LH and OS, particularly due to perceived more limited advantages of Air Berlin's FFP. However, another group of respondents clearly perceives Air Berlin's services as on par or comparable to those provided by LH and OS. In sum, it is concluded that the respondents to the market investigation largely perceive Air Berlin as a valid alternative to LH and OS on these routes.

(188) The transaction does not, therefore, significantly impede effective competition on any of these routes, regardless of the relevant counterfactual.

f. The Munich-Linz route

(189) On the Munich-Linz route (it is estimated by the parties that [50 000 – 60 000]* O&D passengers travel on this route by plane or train), the parties are the only air carriers present (LH as operating carrier and OS as marketing carrier) but they face strong competition from the train services offered by Deutsche Bahn and ÖBB on this route. In addition to a number of indirect connections, Deutsche Bahn and ÖBB offer an average of nine to ten direct train connections between Linz (Hauptbahnhof) and Munich (Hauptbahnhof) a day, with travel times mostly less than or around 3 hours, that is to say travel times which are comparable to the total travel time by plane of approximately 3:00h from city centre to city centre. The market investigation confirmed that those train services represent a viable competitive alternative for both time sensitive passengers and non-time sensitive passengers on this O&D pair. They therefore belong to the same market. In view of the strong market position of the train services, which according to the parties' estimate amount to a market share above [90-100]*% both for time sensitive and non-time sensitive passengers and which has broadly been confirmed by the market investigation, no competition concerns arise in relation to this route, irrespective of whether or not OS can be considered as a potential entrant on this route.

(190) The transaction does not, therefore, significantly impede effective competition on this route, regardless of the relevant counterfactual.

g. Routes which are only operated by OS and where the transaction could eliminate LH as a potential competitor

(191) On the Vienna-Dresden, Vienna-Leipzig, Salzburg-Düsseldorf, Graz-Düsseldorf, Linz-Düsseldorf, Graz-Stuttgart, Innsbruck-Frankfurt and Salzburg-Frankfurt routes, only OS is active as an operating carrier while LH merely markets seats on OS's flights within the framework of the parties' profit and loss sharing joint venture. In view of the absence of actual competition between the parties pre-merger (as a result of their joint venture co-operation), the proposed transaction could significantly impede effective competition only if it resulted in the elimination of LH as a potential competitor.

(192) However, the market investigation revealed that LH would not enter any of these routes absent the co-operation with OS.

(193) At the outset, it should be noted that demand on all these routes is rather low (between [10 000 – 20 000]* and [40 000 – 50 000]* O&D passengers per year). The market investigation indicated that it is not usual for traditional network carriers to enter European short-haul routes of such a limited size in competition to another operating carrier.⁹¹ Accordingly, none of the routes currently operated by OS were operated in parallel by both LH and OS before they began to co-operate with each other in 2000. Also, LH's self-assessment referred to in paragraph (66) considers almost all relevant routes as too thin to attract entry by another player.⁹² Those findings strongly indicate that it would not be economically sustainable for both LH and OS to be present as operating carriers on these routes.⁹³

(194) In addition, as explained in more detail hereafter for each route, a review of internal LH documents on entry strategies and other route-specific elements confirm that LH would not enter any of these routes in competition to OS.

(i) Vienna-Dresden and Vienna-Leipzig

(195) The Vienna-Dresden ([10 000 – 20 000]* O&D and [10 000 – 20 000]* total passengers) and Vienna-Leipzig ([10 000 – 20 000]* O&D and [20 000 – 30 000]* total passengers) routes are thin routes. This is evidenced by the fact that OS bundles these routes together as a stop-over connection. LH has operated only one intra-European route in the form of such a stop-over since 2008⁹⁴ and is therefore unlikely to adopt the same strategy as OS to serve these routes. The low local traffic on these routes indicates that these routes will most likely not viably sustain an operation by both OS and LH.

(196) Furthermore, LH has no international flights departing from Dresden and Leipzig but rather connects both cities to its hubs in Munich and Frankfurt and to its base in Düsseldorf. The unlikelihood of LH's entry on these routes is further underlined by a internal LH document that analyses a possible acquisition of OS by another carrier and clearly states that LH would not enter the Vienna-Leipzig route. [...]*⁹⁵

(197) LH's subsidiary 4U, which already operates out of Dresden airport, previously assessed a business case issued by Dresden airport in April 2006 in which its entry onto the Vienna-Dresden route is discussed. 4U did not execute these plans in 2006 nor the following years, which confirms the parties' submission that 4U did not consider that the operation of this route would be commercially profitable.⁹⁶

91 See replies to question 11 of the phase II market investigation questionnaire to competitors.

92 See "LH/AUA Self-Assessment", pp. 4, 6-8. [...]*

93 The parties further argue that on several routes currently operated by OS, OS would leave the route absent the transaction for various reasons [...]*.

94 See reply to question 3 of request for information to LH of 4 June 2009.

95 LH's internal document [...]*.

96 See reply of LH to request for information of 30 July 2009 and follow-up correspondence of 5 August 2009.

(ii) Salzburg-Düsseldorf, Graz-Düsseldorf, Linz-Düsseldorf

(198) The Salzburg-Düsseldorf ([20 000 – 30 000]* O&D and [20 000 – 30 000]* total passengers), Graz-Düsseldorf ([30 000 – 40 000]* O&D and [30 000 – 40 000]* total passengers) and Linz-Düsseldorf ([30 000 – 40 000]* O&D and [30 000 – 40 000]* total passengers) routes are thin routes. The low local traffic on these routes thus indicates that it would not be economically sustainable for both LH and OS to be present as operating carriers on these routes. This is further underlined by the fact that OS operates the Linz-Düsseldorf route as one leg of the Salzburg-Linz-Düsseldorf and Graz-Linz-Düsseldorf routes in order to bundle demand for travel to Düsseldorf.

(199) In addition, it should be noted that it is very unusual for LH to operate routes out of Düsseldorf below [40 000 – 50 000]* O&D passengers on which a competitor is active.⁹⁷ Also an internal LH document comparing the importance of destinations out of Düsseldorf conveys a low ranking for Graz, Linz and Salzburg ([...]*)⁹⁸, and a further internal LH document explains that [LH would not enter]* if OS was acquired by another carrier.⁹⁹

(200) LH's subsidiary, 4U, which already has operations out of Salzburg airport, is unlikely to enter the Salzburg-Düsseldorf route since it does not currently operate any flights out of DUS airport and has never made a business case to enter this route.¹⁰⁰

(iii) Graz-Stuttgart

(201) The Graz-Stuttgart ([30 000 – 40 000]* O&D and [30 000 – 40 000]* total passengers) route is served by OS since April 2009, while it had previously been served by LH. [...]*¹⁰¹

(202) In addition to OS, the Graz-based local airline Robin Hood is also active on the route, having entered the route in November 2008 with small aircraft. In view of the relatively low traffic on this route and the presence of two operating carriers, it is unlikely that it would be economically sustainable for both LH and OS to be present as operating carriers on this route.¹⁰²

(203) LH's subsidiary, 4U, which already has operations out of STR airport, is unlikely to enter the route since it does currently not operate any flights from Graz airport [...]*.¹⁰³

97 See reply of LH to request for information of 10 June 2009.

98 LH's internal document [...]*.

99 LH's internal document [...]*.

100 See reply of LH to request for information of 30 July 2009.

101 [...]*

102 Similarly, in a scenario where the route would still be operated by OS it is unlikely that OS would enter this route absent its co-operation with LH in view of the presence of two operating carriers and the fact that the only international route out of Graz served by OS is part of the joint venture (Graz-Düsseldorf, except for some leisure routes in Greece served by Lauda Air).

103 See reply of LH to request for information of 30 July 2009.

(iv) Innsbruck-Frankfurt

(204) The Innsbruck-Frankfurt route ([20 000 – 30 000]* O&D and [60 000 – 70 000]* total passengers) is a relatively thin route. Accordingly, a internal LH document states that due to [...] LH would not enter this route if OS was acquired by another carrier.¹⁰⁴ It follows that this route is unlikely to sustain an operation by both LH and OS.

(205) LH's subsidiary, 4U, is unlikely to enter the route since it does not have any operations at either end of the route and [...]*.¹⁰⁵

(v) Salzburg-Frankfurt

(206) The Salzburg-Frankfurt route ([40 000 – 50 000]* O&D and [100 000 – 150 000]* total passengers) is the thickest of all routes between Austria and Germany operated by OS only. [...]*¹⁰⁶

(207) However, an internal LH document explains that LH would not enter this route in case of a possible acquisition of OS by another carrier [...]*.¹⁰⁷ This conclusion is confirmed by information received in the course of the market investigation according to which Salzburg is within the overall catchment area of MUC airport.¹⁰⁸

(208) LH's subsidiary, 4U, which already operates out of Salzburg airport, is unlikely to enter the route since it does not currently operate any flights from FRA airport and has never made a business case to enter this route.¹⁰⁹

(vi) Conclusion

(209) It can therefore be concluded that, due to the low demand on all routes mentioned in (i) – (v) above and on the basis of a review of relevant internal LH documents on entry strategies and other route-specific elements LH is unlikely to enter any of those routes. Hence the elimination of LH as a potential competitor does not significantly impede effective competition, regardless of the relevant counterfactual.¹¹⁰

108 See reply of MUC airport to question 12 of the phase I market investigation questionnaire to airports.

109 See reply of LH to request for information of 30 July 2009.

110 This conclusion is not altered by the fact that most of these routes have been operated profitably by OS in recent years. Indeed, Graz-Düsseldorf, Düsseldorf-Linz, Dresden-Vienna, Frankfurt-Salzburg and Stuttgart-Graz were operated profitably in recent years while the Innsbruck-Frankfurt, Düsseldorf-Salzburg and Vienna-Leipzig routes have been loss-making in one or more recent years, see reply of the parties to question 9 of request for information of 27 April 2009.

h. Routes which are only operated by LH and where the transaction could eliminate OS as a potential competitor

- (210) Only LH is active as operating carrier on the Innsbruck-Hamburg, Klagenfurt-Munich, Graz-Frankfurt, Graz-Munich and Linz-Frankfurt routes, while OS merely markets seats on those flights in the framework of the parties' joint venture. In view of the absence of actual competition between the parties pre-merger, the proposed concentration could significantly impede effective competition on these routes only if it resulted in the elimination of OS as a potential competitor on these routes.
- (211) However, the market investigation revealed that OS would not enter any of these routes absent the co-operation with LH.
- (212) Indeed, demand on these routes is often relatively low and none of the routes currently served by LH (except the Graz-Frankfurt route) was served by both parties before they started their co-operation in 2000. [...] ¹¹¹ These findings strongly indicate that it would not be economically sustainable for both LH and OS to be present as operating carriers on these routes.
- (213) Furthermore, none of these routes are mentioned in an internal OS document that sets out the restructuring measures to be taken if OS were to remain independent, ¹¹² which is in line with the fact that OS has no hubs at either end of any of these routes. This further underlines the fact that OS would not enter any of these routes absent the co-operation with LH.
- (214) Furthermore, OS argues that in view of its financial situation it will henceforth focus on routes with high passenger rates, which further underlined that it would not enter any of the routes at issue. In line with that submission, OS appears to have decided to remove a number of 50-seater aircraft and partly replace them by larger aircraft from the existing OS fleet. ¹¹³
- (215) In addition to these general observations, a review of internal OS documents on entry strategies and other route-specific elements confirm that OS would not enter these routes in competition to LH.

(i) Klagenfurt-Munich and Innsbruck-Hamburg

- (216) The Klagenfurt-Munich ([0 – 10 000]* O&D and [10 000 – 20 000]* total passengers) and Innsbruck-Hamburg ([0 – 10 000]* O&D and [0 – 10 000]* total passengers, a seasonal route) routes are thin routes.

111 [...]*

112 OS document [...]*.

113 See reply of OS to request for information of 5 August 2009; see also <http://www.nur-flug-tours.de/news/airlinenews-8140.htm>. It should also be noted in this context that apart from the Graz-Frankfurt route, the Graz-Munich, Innsbruck-Hamburg, Klagenfurt-Munich and Linz-Frankfurt routes have been loss-making in one or more recent years, see reply of the parties to question 9 of request for information of 27 April 2009.

(217) Out of Klagenfurt airport, OS currently only serves Vienna (it ceased operations on the Klagenfurt-Frankfurt route in April 2008) which underlines that Klagenfurt airport is not of strategic importance to OS' international flights. As regards the Innsbruck-Hamburg route, it should be noted that Transavia entered in December 2008 with five weekly frequencies in winter seasons and that TUIfly announced a direct service in winter seasons starting in Winter 2009/2010. Consequently, several players will henceforth be active on the route and it is therefore unlikely that OS would enter this thin route as a further player. In view of these reasons, OS is unlikely to enter both routes absent its co-operation with LH.

(ii) Frankfurt-Graz and Graz-Munich

(218) In the case of the Frankfurt-Graz route ([50 000 – 60 000]* O&D and [100 000 – 150 000]* total passengers), local traffic may sustain the operation of two carriers while local traffic is more limited in case of the Graz-Munich ([10 000 – 30 000]* O&D and [80 000 – 90 000]* total passengers/year) route.¹¹⁴

(219) However, an analysis of the routes where OS entered in the recent past strongly indicates that OS is unlikely to enter the Frankfurt-Graz route or Munich-Graz route: indeed, OS' last entry from Graz was in 2003 (the Graz-Düsseldorf route in the framework of the joint venture with LH). In the more recent past, OS most often entered routes that connect Vienna with a destination in the East, [...]*¹¹⁵ Entering the Frankfurt-Graz route or the Munich-Graz route would thus not fit into OS' entry strategy. In addition, an analysis of OS' recent entries revealed that it is very unusual for OS to enter intra-European routes against existing competition.¹¹⁶

(iii) Frankfurt-Linz

(220) For similar reasons, OS is also unlikely to enter the Linz-Frankfurt ([40 000 – 50 000]* O&D and [100 000 – 150 000]* total passengers) route absent the co-operation with LH. While local traffic is rather limited and it is therefore unclear if the route might sustain the presence of two operating carriers, it is to be recalled that before the parties' co-operation began in 2000, only one of the parties was active on this route. OS' last entry involving Linz airport was in 2003 (Düsseldorf-Linz-Graz/Salzburg, that is to say a stop-over) and an analysis of the routes where OS entered in recent years showed that OS mostly entered routes that connect Vienna with a destination in the East, [...]*.

114 It should be noted that prior to the co-operation between the parties, the Frankfurt-Graz route was operated by the regional airline Tyrolean Airways, which OS acquired in 1998 shortly before LH and OS entered into their co-operation. The parties argue that it was natural to shift Tyrolean Airways' operations to LH upon their co-operation.

115 [OS internal documents]*

116 See reply of OS to question 7 of request for information of 4 June 2009 and to question 2 of request for information of 10 June 2009 according to which - apart from seasonal routes and the Vienna-Luxembourg route which was before operated by OS as a stop-over connection via Strasbourg - OS has entered only the Vienna-Basel route (35 000 O&D passengers and 45 000 total passengers in the year of entry) against existing competition.

(iv) Conclusion

(221) It can therefore be concluded that due to the relatively low demand on all these routes and on the basis of a review of the relevant internal OS documents on entry strategies and other route-specific elements, the transaction does not eliminate OS as a likely potential competitor on any of those routes and does therefore not significantly impede effective competition on these routes, regardless of the relevant counterfactual.

(222) As the proposed transaction does therefore not lead to the elimination of potential competition on either of the routes on which OS currently operates, nor on the routes which are currently only served by LH, no competition problems arise, regardless of the counterfactual situation.

(2) Routes between Austria and Switzerland

(223) Direct-direct "overlaps" between OS and LH's subsidiary LX exist on the following routes between Austria and Switzerland.

(i) Vienna-Basel: served by OS; LX markets seats under code share;

(ii) Vienna-Geneva: served by OS; LX markets seats under code share;

(iii) Vienna-Zurich: served by both LX and OS who also code share.

(224) With regard to the Vienna-Geneva ("VIE-GVA") and Vienna-Basel ("VIE-BSL") routes, LX does not operate on these routes, but rather markets seats under a code-share agreement with OS. The parties submit that on both routes the code-share arrangement eliminates competition between LX and OS and that there is no residual competition.

(225) According to the notifying party, the code-share agreement between LX and OS is a standard "free-sale" (also "free-flow") agreement. The notifying party submits that the marketing carrier does not have its own reserved inventory on the aircraft in question. Instead, under a free-sale code-share agreement, the marketing carrier has real-time electronic access to the operating carrier's seat inventory. This means that prior to confirming a booking on the flight in question the marketing carrier must ascertain whether a seat in the appropriate category is still available. The operating carrier retains inventory control in order to ensure that the marketing carrier does not fill the flight with low-yield traffic (such as cheap restricted economy tickets for O&D passengers) when such bookings would squeeze out higher-yield passengers that the operating carrier could otherwise attract (such as O&D or connecting business class passengers). This is achieved by a process of "mapping" the carriers' respective fare classes and providing the marketing carrier access to seats in the relevant corresponding fare category on a "first come, first serve" basis. Thus, the marketing carrier is offered equal treatment in terms of accessing seats on a flight, without however undermining the operating carrier's yield management system.

(226) In standard free-sale code share agreements, the marketing carrier remains free to set its fares, subject to the "mapping" process that aligns the marketing and operating carrier's

booking classes. The operating carrier typically retains the revenue for the sector in question and pays the marketing carrier a commission. For direct flights on the route in question, the relevant revenue is the marketing carrier's ticketed fare, for indirect flights (for instance the Geneva-Vienna-Tel Aviv route), part of the ticketed fare for the whole journey is pro-rated to the code shared sector (for instance the VIE-GVA route) based on general industry principles or a specific agreement among the carriers (so-called special prorate agreements, or SPAs). The marketing carrier sells the tickets for a flight of the operating carrier exclusively under its own code.

a. The Vienna-Basel route

(227) The total number of passengers on the VIE-BSL route in 2008 was approximately [40 000 – 50 000]*, out of which [30 000 – 40 000]* passengers were O&D passengers. On VIE-BSL, the parties do not face competition from another operating carrier. The joint venture agreement between LH and OS does not cover the operations of LX, and therefore does not cover the routes between Austria and Switzerland. The route is currently served by OS while LX markets the seats of OS flights under a free-sale code-share agreement. The market investigation has indicated that there is no or limited competition between OS and LX due to their code-share agreement.

(228) While internal LH documents show that LH would consider entering the route if OS was bought by Air France-KLM,¹¹⁷ and further review of documents for the Swiss Management Board on the "Basel update and outlook"¹¹⁸ suggested that Swiss was considering possibly adding another aircraft to its Basel base, it seems unlikely that LH's subsidiary LX would enter this route. The route is currently served with [30 000 – 40 000]* O&D passengers and [40 000 – 50 000]* total passengers. As Basel airport is not a hub for LX, it could not rely on any large feeder traffic element, and it is thus unlikely that the route is thick enough to support two carriers that would have to share the current number of O&D passengers (although it is likely that Swiss would generate some additional demand on the route on its own).¹¹⁹ This is further confirmed by LX's profitability analysis that the Commission requested during phase II [...]*¹²⁰. Moreover, the Basel update also notes that "under the aspect of the unsatisfying results in the first year as well as the uncertain outcome of 2008 results it is questionable if a capacity increase should already be considered." Given the currently negative economic conditions that also characterized 2008, it thus follows that it is unlikely that Swiss will base another aircraft at Basel airport in the near future.

(229) The conclusion that the VIE-BSL route is not thick enough to support two carriers is also supported by internal OS documents indicating that OS would exit this route in case of

117 LH's internal document [...]*.

118 Management Board, 4.4. 2008, Basel update and outlook.

119 Moreover, with two carriers competing on the route, prices would be bound to go down, which further decreases the attractiveness of entering the route.

120 [...]*.

down-sizing in a stand alone scenario, which was further confirmed by OS' submission that shows that the route has been loss-making [...]*121.

(230) It follows that the transaction is unlikely to eliminate LX as a potential competitor on this route which is currently served by OS. As the transaction does therefore not lead to the elimination of a likely potential competitor on the route, it would not significantly impede effective competition, regardless of the relevant counterfactual or the precise market definition.

b. Vienna-Geneva

(231) In 2008 approximately [100 000 – 150 000]* passengers travelled on the route VIE-GVA, out of which [60 000 – 70 000]* passengers were O&D passengers. The route is served by OS while LX markets seats under the code-share agreement the details of which have been set out above.

(232) The route is served by OS while LX is only a marketing carrier. Considering the commercial balance between the operating and the marketing carrier in such code-share agreements it seems that there is limited residual competition between the parties on VIE-GVA and that the marketing carrier has limited ability and incentive to compete aggressively with the operating carrier for O&D traffic. This has been confirmed by the market investigation which showed that LX and OS currently compete only to a very limited extent on this route.

(233) An internal LH document indicates that if OS was acquired by Air France/KLM, LH would consider entry on VIE-GVA with [...] weekly frequencies if this is justified by [...]*.¹²² The Commission thus investigated whether there would be sufficient corporate demand such that LX would likely enter this route in the future.

(234) In recent years, LX significantly downscaled its operations out of Geneva airport ("GVA airport") in favour of its hub at Zurich Airport ("ZRH airport"). Its strategy from 1995 was to favour ZRH airport" as a hub and to limit its activities out of GVA airport. From 2002 (LX's first full year of operation) to 2006 (LX's first profitable year, following its acquisition by LH and turnaround), LX further downscaled operations out of GVA airport. The overall number of LX's planes was reduced by 50%, the number of intra-European routes from GVA airport was reduced by 60%, and the number of GVA flights was cut by 64%. Today, LX has only four or five aircraft based at GVA airport (out of 100 LX' aircraft based in Switzerland, principally in Zurich) and maintains a minimal level of activity at GVA airport to maintain its image as the Swiss national flag carrier.

(235) Moreover, during the phase II investigation, LH submitted a profitability analysis of all of LX's eleven intra-European routes out of GVA airport, [...]*. It is particularly noteworthy that two of these nine routes [...] have a significant O&D element of more than 100 000 passengers, and yet they are highly unprofitable. It would thus seem likely that the entry on

121 OS' presentation [...]*

122 LH presentation entitled [...]*

VIE-GVA would not be profitable for LX, as the total traffic of [100 000 – 150 000]* passengers (including the [60 000 – 70 000]* O&D passengers) would be divided between LX and OS. Moreover, prices would be reduced as a result of two carriers competing on the route.

(236) On the basis of the above, it is concluded that LX would not be likely to enter the market in the absence of the merger. It follows that the transaction is unlikely to eliminate LH/LX as a likely potential competitor on this route which is currently served by OS. The transaction therefore would not significantly impede effective competition on the common market on VIE-GVA, regardless of the relevant counterfactual or the precise market definition.

c. The Vienna-Zurich route

(237) Annually about [500 000 – 550 000]* air passengers travel on the Vienna-Zurich route ("VIE-ZRH") out of which [300 000 – 350 000]* passengers are O&D passengers. Both OS and LX operate on this route. They also code-share their flights on this route.

(238) On VIE-ZRH, LX currently operates 28 weekly frequencies and OS operates 27 weekly frequencies. Niki is the only competitor and operates 18 weekly frequencies albeit with larger aircrafts. Niki operates three daily frequencies on weekdays, one daily frequency on Saturdays and one daily frequency on Sundays. Since its entry in 2004 Niki has increased its weekly frequencies from 12 to 18, and in the relatively short period since its entry, Niki has been able to increase its market share significantly.

(239) According to the parties' estimates the market structure on the VIE-ZRH route in the Summer season 2008 and the Winter season 2008/2009 was as follows:

Airline	SS 08 figures on VIE-ZRH		WS 08/09 figures on VIE-ZRH	
	Time Sensitive	All passengers	Time Sensitive	All passengers
LX	[10-20]*%	[20-30]*%	[10-20]*%	[20-30]*%
OS	[10-20]*%	[10-20]*%	[10-20]*%	[10-20]*%
Combined	[30-40]*%	[30-40]*%	[30-40]*%	[30-40]*%
Niki	[60-70]*%	[60-70]*%	[60-70]*%	[50-60]*%
Air Berlin	0%	0%	0%	[5-10]*%
Others	0%	0%	0%	[0-5]*%

Source: Estimates of the parties on the basis of MIDT data¹²³

(240) On the basis of the market investigation the Commission has endeavoured to reconstruct the market for all passengers for the IATA summer season 2008 and the winter season 2008/09. The market shares are based on figures of flown passengers.¹²⁴

123 LH estimated market shares for some air carriers, whose bookings are not reflected in MIDT (like 4U, Niki, SkyEurope etc.) based on data published by the German Statistical Office and other publicly available information about schedules, frequencies and utilized aircraft, see paragraphs 336-347 of the Form CO. The parties did not consistently provide estimates for all airlines which are only partly covered by MIDT.

Figures on VIE-ZRH: all passengers		
Airline	SS 08	WS 08/09
LX	[40-50]%	[30-40]%
OS	[20-30]%	[10-20]%
Combined	[60-70]%	[50-60]%
Niki (incl. Air Berlin)	[30-40]%	[40-50]%

- (241) The market investigation has indicated that LX and OS compete on this route to a limited extent.
- (242) As regards Niki's position on VIE-ZRH, a considerable number of corporate customers does see Niki as a credible alternative to LH/OS for time sensitive customers and consider Niki's frequencies, flight schedules and prices attractive. In addition, the clear majority of travel agents consider Niki a credible alternative for time sensitive passengers. Thus, to a certain extent, Niki seems a credible alternative for both time sensitive and non-time sensitive passengers.
- (243) The finding that Niki constrains the merging parties to quite some extent is further confirmed by the additional booking analysis performed in phase II.
- (244) It results from this analysis that Niki is the largest carrier for the non-time sensitive segment that generally seems to book fairly early prior to departure, while it seems to constrain the parties to a considerable extent with regard to time sensitive passengers booking close to the date of departure, which is consistent with the findings from the qualitative analysis.
- (245) The finding that Niki represents, to a considerable extent, a credible constraint for time sensitive passengers is confirmed by the comparison of the average prices of the tickets bought by passengers that book close to the date of departure on the three carriers. Niki's prices seem to be more or less comparable to Swiss' prices, and, in certain months, Niki's tickets appear to be on average more expensive. Moreover, when compared with OS, Niki's tickets are consistently, albeit only slightly, more expensive.
- (246) In addition to this quantitative and qualitative analyses which indicate that Niki exerts a considerable competitive constraint on the parties, it is to be recalled that the VIE-ZRH route has already been examined in the previous Lufthansa/Swiss merger Decision¹²⁵ where the Commission authorised the acquisition of LX by LH subject to slot release remedies on several routes. With regard to the VIE-ZRH route, LH committed to release slots necessary to support up to four daily frequencies operated by a new entrant. This remedy will continue to be in place for this route after the closing of the transaction.

124 The comparability of the data collected in the market investigation from different companies may be affected by possibly different methods of data collection. In particular, the parties provided various sets of "flown passenger data".

125 See Case No. COMP/M.3770 – Lufthansa/Swiss.

(247) This possibility to obtain slots under the remedies of the Lufthansa/Swiss Decision considerably lowers entry barriers which would otherwise exist due to the fact that both VIE airport and ZRH airport are congested. In particular, with regard to ZRH airport, runway constraints exist during peak hours and most peak hours are completely full. The peak arrival times are between 06.00 to 06.55, 08.00 to 08.55, 11.00 to 11.55, 16.00 to 16.55, 19.00 to 19.55 and 21.00 to 21.55 and peak departure times are between 07.00 to 07.55, 09.00 to 09.55, 12.00 to 12.55 and 17.00 to 17.55. It follows that the remedies of the Lufthansa/Swiss Decision which will continue to be in place will significantly facilitate entry.¹²⁶ Those remedies not only enable new entrants to enter the route, but also allow Niki to further increase its frequencies on the route which would strengthen its market position in particular in relation to time sensitive passengers.

(248) Accordingly, in view of the competitive constraint exercised by Niki, combined with reduced barriers to entry on VIE-ZRH stemming from the remedies under the Lufthansa/Swiss Decision which will continue to be in place after the completion of the proposed transaction, the transaction would not significantly impede effective competition regardless of the relevant counterfactual or the precise market definition.

(3) *The Vienna-Brussels route*

(249) With respect to the Vienna-Brussels route ("VIE-BRU"), someone which [250 000 – 300 000]* O&D and [350 000 – 400 000]* total passengers travelled in 2008, OS operates five daily frequencies on weekdays and three and four frequencies on Saturday and Sunday respectively. In the IATA Summer season 2009 SN operates 3 daily frequencies on weekdays and 1 and 2 on Saturday and Sunday respectively, a total of 18 weekly frequencies. In the IATA Winter season 2008/09 SN operated 21 weekly frequencies and will also operate those frequencies in the coming winter season. SkyEurope, a low-cost carrier, entered this route in March 2007 and operates one daily frequency, albeit with larger planes. On 22 June 2009, Sky Europe filed for bankruptcy. However, it is still operating and it recently appears to have received some additional funds.¹²⁷

(250) It should be noted that FR started operations between the secondary airports on BTS airport – CRL airport in April 2009 with three weekly frequencies.

(251) As regards the relevant counterfactual, SN and OS currently compete on VIE-BRU. OS and SN do not have any bilateral or alliance agreement with respect to this route.

(252) According to the parties' estimates the market structure is as follows:¹²⁸

126 It should be noted that Niki entered VIE-ZRH with slots acquired under the normal slot allocation procedure in 2004, namely before the remedies of the Lufthansa/Swiss decision were in effect.

127 See: http://www.ftd.de/unternehmen/handel_dienstleister/:Angeschlagene-Fluglinie-SkyEurope-findet-Investor/547636.html.

128 LH estimated market shares for some air carriers, whose bookings are not reflected in MIDT (like 4U, Niki, SkyEurope etc.) based on data published by the German Statistical Office and other publicly available information about schedules, frequencies and utilized aircraft, see paragraphs 336-347 of the Form CO. The parties did not consistently provide estimates for all airlines which are only partly covered by MIDT.

Airline	SS 08 figures on VIE-BRU		WS 08/09 figures on VIE-BRU	
	Time Sensitive	All passengers	Time Sensitive	All passengers
SN	[0-5]*%	[20-30]*%	[0-5]*%	[20-30]*%
OS	[50-60]*%	[30-40]*%	[60-70]*%	[40-50]*%
BMI	[0-5]*%	0%	[0-5]*%	[0-5]*%
Combined	[50-60]*%	[50-60]*%	[60-70]*%	[60-70]*%
SkyEurope	[40-50]*%	[40-50]*%	[30-40]*%	[30-40]*%

Source: Estimates of the parties on the basis of MIDT data.

(253) The combined market share of the parties for time sensitive passengers seems to have been underestimated as the parties have based their market share estimates on a split between business class and economy class tickets and SN does not offer any business class tickets, but only flexible economy tickets. SN's response also suggests that SN sells a considerable percentage of fully flexible economy class tickets. Taking into account the fact that many corporate customers consider fully flexible tickets as suited to their needs in view of their time constraints, these tickets should be also considered as belonging to the market of time sensitive passengers. Also, SkyEurope's market share for time sensitive figures as provided by the parties seems highly overestimated.

(254) The table below illustrates the parties' and competitors' market shares on VIE-BRU on the basis of the market investigation.¹²⁹

WS 08/09 figures on VIE-BRU	
Airline	All passengers ¹³⁰
SN	[30-40]%
OS	[40-50]%
BMI	[0-5]%
Combined	[70-80]%
NE (SkyEurope)	[20-30]%

Source: transported passengers figures provided by the parties and SkyEurope.

(255) The parties argue that significant slot constraints are absent at BRU airport and VIE airport and that there would therefore be no substantial barriers to entry. According to the parties, competition concerns are unlikely to arise with respect to this route given that the parties face competition from SkyEurope and Ryanair and, in addition, EasyJet has operations at both VIE airport and BRU airport and could easily enter this route if OS/SN were to increase prices.

(256) In the market investigation, the majority of travel agents responded that customers would not switch to a competing carrier even in the case of a significant price increase by OS/SN.

¹²⁹ The comparability of the data collected in the market investigation from different companies may be affected by possibly different methods of data collection. In particular, the parties provided various sets of "flown passenger data".

¹³⁰ The Commission was not able to reconstruct the market for time sensitive passengers since SkyEurope does not distinguish between time sensitive and non-time sensitive passengers, but offers only one fare class and the price of tickets is purely driven by demand. It provided only a very rough estimate which could not be used for the purpose of market reconstruction. Its estimate seemed too high given its low number of frequencies and the average split between time sensitive and non-time sensitive passengers.

They also predicted a price increase by OS/SN on this route. In addition, many corporate customers stated that the merger will have an impact on this route and voiced concerns that the merger will reduce competition which will lead to increased prices.

- (257) In light of the above, under the current conditions and at the current level of services SkyEurope does not exert sufficient competitive pressure on the parties. The in-depth investigation has clearly confirmed that SkyEurope is not seen as credible alternative to the merged entity even for non-time sensitive passengers. With seven weekly frequencies, namely one daily flight, SkyEurope's services are clearly not an alternative for time sensitive passengers because this frequency does not allow for one-day return trips. In addition, the future of SkyEurope is unclear since the company has recently filed for bankruptcy and might undergo a restructuring process.
- (258) A pricing analysis conducted by the Commission also confirmed that SkyEurope does not constitute a strong constraint for the parties in the market for time sensitive passengers. In relation to business class tickets, the entrance of SkyEurope did not have a noticeable impact on SN and OS's prices. In relation to fully flexible tickets only SN's prices seemed affected while OS' prices seemed unaffected. Regarding non-time sensitive passengers the data did not allow for a conclusive answer.
- (259) FR's activities on BTS airport – CRL airport do not constrain the parties to any meaningful degree. FR started operating on BTS airport – CRL airport in April 2009 with three weekly frequencies. The market investigation has confirmed that flights from VIE airport to BRU airport and BTS airport to CRL airport are not in the same market, as (i) BTS airport is situated 87 km from Vienna city centre, which corresponds to a driving time of more than 60 minutes by car and 75 to 95 minutes by bus, and (ii) CRL airport is located 46 km from the centre of Brussels and is reachable by car in 45 minutes, by bus in 45 minutes or by train in 50 minutes. In addition, the operations between two secondary airports represent a far less immediate constraint than operations between two primary airports. The in-depth market investigation has confirmed that FR operations on CRL-BTS would not act as a competitive constraint on the merged entity, but rather, will create its new demand.
- (260) As regards the Air France-KLM counterfactual, it can be reasonably expected that OS and SN will continue to compete on this route and the transaction therefore raises serious doubts as to its compatibility with the common market also under this alternative foreseeable scenario.
- (261) In terms of barriers to entry, as explained in paragraph (118), VIE airport is congested during peak times. Peak times for VIE airport are between 08.30 and 11.00 and between 16.00 and 20.45. In the IATA Winter season 2008/2009 runway capacity has also been exhausted in the mornings as early as 07:35 until 11:50, with capacity being close to full as early as 06.00. Moreover, there are runway capacity limitations from 21.00 until 06.55. Regarding BRU Airport, although SkyEurope was able to enter the route in March 2007, the market investigation has shown that this airport is currently capacity-constrained during peak times (08.00-10.00 and 18.00-20.00). The capacity constraints at both airports mean that market entry is difficult.

(262) It is concluded from the above that regardless of the exact market definition, the proposed transaction raises serious doubts as to its compatibility with the common market on VIE-BRU, under any possible counterfactual and any possible market definition.

(4) *The Vienna-London route*

(263) On the Vienna-London route ([300 000 – 350 000]* O&D and [500 000 – 550 000]* total passengers), an overlap between the parties arises since OS operates Vienna-Heathrow while BMI code-shares on OS on this route by way of a standard free-flow code-sharing agreement. Irrespective of whether or not the transaction leads to the elimination of actual or potential competition, the parties face significant competition coming from British Airways ("BA") in any event, which also operates flights to Vienna from London Heathrow. The current competitive situation on the route is illustrated as follows.

Airline	SS 08 figures on Vienna-London		WS 08/09 figures on Vienna-London	
	Time Sensitive	All passengers	Time Sensitive	All passengers
OS	[50-60]*%	[40-50]*%	[50-60]*%	[50-60]*%
BMI	[0-5]*%	[0-5]*%	[0-5]*%	[0-5]*%
Combined	[50-60]*%	[50-60]*%	[50-60]*%	[50-60]*%
BA	[40-50]*%	[40-50]*%	[40-50]*%	[40-50]*%

(264) In addition, EasyJet serves Vienna-London Luton, and Aer Lingus opened a new base at London Gatwick in April 2009 from which it started operating flights to Vienna.

(265) It can be left open whether the services offered by Easyjet and Aer Lingus belong to the same market as the parties' services on London Heathrow-Vienna, since in any event no competition concerns arise due to the limited increment brought about the transaction and the presence of BA as a strong competitor of the parties on Vienna-Heathrow. This has also been confirmed by most respondents to the market investigation.

(266) It follows that also in relation to the Vienna-London route, the transaction would not significantly impede effective competition, regardless of the relevant counterfactual or the precise market definition.

(5) *Direct-indirect and indirect-indirect overlaps*

(267) The proposed transaction gives rise to a large number of affected routes concerning direct-indirect overlaps between LH and OS both within Europe and from European airports to extra-European destinations. The routes include both short- and medium-haul routes, and long-haul routes. In addition, numerous affected routes, on which both LH and OS provide indirect services, were identified. Also these routes include routes for short-, medium- and long-haul distances both within Europe, and from European airports to extra-European destinations.

(268) The routes were analysed with respect to the market position of the parties and the market share increment brought about by the transaction. Furthermore, the presence and position of

competitors and the number of passengers on each route were assessed. Where necessary, the number and duration of frequencies offered by competitors and their suitability for time sensitive passengers, in particular, were assessed. On the basis of these criteria, no competition concerns were identified. In addition, the market investigation did not reveal any competition concerns with respect to the identified direct/indirect and indirect/indirect overlaps with the exception of LH's and OS' market position in Central and Eastern Europe ("CEE").

- (269) Some respondents to the market investigation in phase I voiced concerns with respect to the strong market position of LH and OS in CEE, concerning mainly the post-transactional control by LH of a very substantial part of a so-called Central European market, particularly as a result of their control of the most important hubs catering CEE and their well-developed networks concerning this area. The results of the more refined phase II market investigation showed, however, that the vast majority of corporate customers in particular do not see any negative impact in relation to a potentially strengthened position of the merged entity for flights serving the CEE and indicated existing alternative competitors.
- (270) OS served 48 destinations in CEE,¹³¹ and LH 40 destinations¹³² in 2008, with 26 destinations being served by both LH and OS.¹³³ There appear, however, to be other significant competitors that serve CEE. In particular, Europe's largest carrier Air France/KLM serves 15 destinations in CEE using its own network, while it serves an additional 11 destinations in co-operation with its SkyTeam partners Aeroflot (the national airline of Russia that has a significant network in CEE due to its current and historical links with CEE countries) and CSA (the Czech flagship carrier).¹³⁴ In addition, the third largest European airline, BA, serves 13 destinations in CEE using its own network, while Malev (the Hungarian flagship carrier), a BA partner in the oneworld alliance, serves 22 destinations in CEE. Hence, there are other important carriers that serve CEE and that can provide an alternative to LH and OS.
- (271) The finding that Eastern European carriers can also provide an alternative to LH/OS is further confirmed by the market investigation that revealed that the vast majority of travel agents compare the LH/OS's prices with those of alternative carriers, including Eastern European carriers (such as MALEV or Czech Airlines). Also, the majority of corporate customers indicate that they do not procure their flights from one airline, but, depending on the CEE destination, search for flight alternatives with other carriers, including Eastern European carriers. It thus appears that there are other carriers competing with LH/OS in CEE and can offer alternatives to customers who want to fly to CEE destinations.

131 Source: OS internal documents, OS Management presentation dated September 2008, p. 3. From the 48 destination, 5 destinations are operated by partner airlines.

132 Source: OS internal documents, OS Management presentation dated September 2008, p. 3. From the 40 destinations served by LH, 23 destinations were served from the LH hub Munich.

133 In 2008, LH, LX and OS served each the following 8 destinations in CEE: Sofia, Prague, Budapest, Warsaw, Bukarest, Belgrade, Moscow, St. Petersburg. Moreover, LH and OS served each further 18 destinations: Tirana, Yerevan, Baku, Sarajevo, Minsk, Tbilisi, Zagreb, Astana, Vilnius, Riga, Krakow, Sibiu, Timisoara, Nizhniy Novgorod, Rostov, Ekaterinburg, Donetsk, Kiev.

134 Source: OS internal documents, BCG presentation to the Supervisory Board dated 28 July 2009, p. 90.

- (272) Some competitors indicated in the market investigation that a lack of air traffic rights to non-EU countries in CEE poses barriers to competition with regard to services to CEE destinations. The Commission is aware of the situation regarding traffic rights, however, recalls that Member States have the obligation to review the allocation of rights under air service agreements, and are also encouraged to give a prominent role to the competition criterion in this review.
- (273) On the basis of Regulation (EC) No 847/2004,¹³⁵ and in particular Article 5 thereof, Austria has to ensure the distribution of traffic rights among eligible Community air carriers on the basis of a non-discriminatory procedure when it concludes an agreement, or amends an agreement or its Annexes, that provide for limitations on the use of traffic rights or the number of Community air carriers eligible to take advantage of traffic rights. On the basis of Article 6 of Regulation (EC) No 847/2004, Austria notified the Commission of the procedures that will be applied, which are about to be published in the Official Journal of the European Union for information purposes. In those procedures,¹³⁶ the promotion of competition between providers of air services is one of the elements in the allocation of traffic rights under paragraphs 15 (3), (4), (5) of the procedures.
- (274) In light of the above, it is concluded that the proposed concentration would not significantly impede effective competition with respect to those routes.

B. Air transport of cargo

- (275) LH is active in the air cargo market through its wholly-owned subsidiaries LH Cargo AG and Swiss WorldCargo. It currently operates 15 freighter aircrafts¹³⁷ and sells capacity on chartered freighters, in addition to the "belly space" of its passenger flights. OS's activities in the cargo sector are rather limited as they rely on "belly space" cargo capacity on passenger flights.
- (276) As regards intra-European routes, the parties have estimated their combined market share to be approximately [10-20]*% in volume of the total air cargo transport in Europe and well below that percentage if alternative means of transport are taken into account.
- (277) As mentioned in section V of this Decision, air cargo markets are unidirectional and, regarding routes from Europe to Asia and the Middle East, are assessed on a continent to country basis. On intercontinental routes, the figures provided by the parties and based on

135 Regulation (EC) No 847/2004 of the European Parliament and of the Council of 29 April 2004 on the negotiation and implementation of air service agreements between Member States and third countries, OJ L 157, 30.4.2004, p. 7.

136 96. Bundesgesetz über den zwischenstaatlichen Luftverkehr 2008 (BGzLV 2008), published on 2 July 2008 in the Bundesgesetzblatt für die Republik Österreich. Paragraph 16 (3) of the procedures foresees the reallocation of allocated scarce traffic rights by the Austrian Ministry for Transport, Innovation and Technology on the expiry of five years after a previous allocation of traffic rights.

137 In March 2009 Lufthansa Cargo decided to temporarily remove four freighters from its fleet.

the parties' best estimates¹³⁸ show that combined, the parties will exceed [10-20]*% of the market share on the following routes: Europe-North America, North America-Europe, Europe-Iran, Iran-Europe, Europe-India, Armenia-Europe, Europe-Kazakhstan.

(278) On the routes Europe-North America, North America-Europe, Europe-Kazakhstan, Europe-Iran, the increment after the merger is very small, as OS has a market share of less than [0-5]*% on all these trade-lanes. Moreover, on all these trade-lanes the parties' combined market share does not exceed [20-30]*% (on the basis of incomplete CASS data) or [10-20]*% (on the basis of the parties' best estimates).

(279) With regard to the other routes, the overlap is more significant but still small:

	Market shares based on parties' estimates	
	LH's market share (including LX and BMI)	OS's market share
Armenia – Europe route	[10-20]*%	[5-10]*%
Europe – India route	[20-30]*%	[0-5]*%
Iran – Europe route	[10-20]*%	[0-5]*%

Source: Form CO.

(280) Armenia-Europe is a thin route with outbound traffic of less than [500 – 1000]* tonnes a year. On such small trade lanes, the merged entity still will face competition from Aeroflot, Air Armenia, Armavia, Czech Airlines and Air Baltic.

(281) Iran to Europe is also a relatively thin route with traffic of [1 000 – 5 000]* tonnes a year. The parties' market shares are outweighed by those of Iran Air ([40-50]*%) and Air France-KLM ([20-30]*%). Other competitors such as Emirates and Turkish Airlines are present on this market.

(282) With regard to Europe-India, the merged entity still will face competition from important and effective competitors such as BA, whose market shares are comparable to those of the parties, and Singapore Airlines, Cathay Pacific and Jet Airways.

(283) The Commission has also analyzed these markets on the basis of CASS and/or WorldACD data only. On such a basis, the merged entity would have market shares exceeding [10-20]*% on five additional routes: India-Europe, Israel-Europe, Russia-Europe, Europe-Armenia and Syria-Europe.

(284) According to such data, the parties' market share would be over [40-50]*% on the trade lane from Israel to Europe and from Russia to Europe only. However, as noted, no reliable, public market data for the transport of cargo is available and CASS and/or WorldACD data do not reflect the entire air cargo markets. CASS does not include sales to agents that are not

138 It should be noted that as there are no public sources offering reliable market data for the transport of cargo towards Asian and Middle Eastern countries, the market shares referred to in this analysis are based on the parties' best estimates on the basis of incomplete CASS data.

registered with IATA, nor direct sales to end-customers. Further, CASS does not include cargo transported by integrators such as DHL, FedEx and UPS. WorldACD data reflect an even smaller proportion of the market as only twenty-four carriers provide their data to WorldACD.

- (285) As a matter of fact, on the trade lane from Israel to Europe, other important carriers like EL Al, CAL (an Israeli all cargo airline) and MNG (an all cargo airline) are also active and are not reflected in the data referred to in the preceding paragraph. Similarly on the trade lane from Russia to Europe, Aeroflot, whose activities are not reflected in the available data, also operates on that route, as well as other significant competitors such as Air France-KLM and Cargolux (an all cargo airline). In the same way, other effective competitors such as BA, Singapore Airlines, Cathay Pacific and Jet Airways (from India to Europe), Aeroflot, Air Armenia, Armavia, Czech Airlines and Air Baltic (from Europe to Armenia) and Cargolux and Turkish Airlines (from Syria to Europe) operate on the India-Europe, Europe-Armenia and Syria-Europe trade lanes. Again, many of those competitors' activities are not reflected in the available data.
- (286) The available data are therefore substantially incomplete: the data do not represent all the players on the markets and do not reflect the real markets sizes and therefore significantly overestimate the parties' market shares. For this reason and in light of the presence of strong competitors on all of the five trade-lanes, the Commission considers that these routes do not raise any competitive issue.
- (287) More generally, it follows from the above that on all the affected routes, other significant competitors are present (combined airlines, all cargo carriers and, to a lesser extent, integrators) that are in a position to substantially constrain the competitive position of the parties in all possible segments of the market. Barriers to entry are lower than in the scheduled passenger air transport services, given the existence of the flexibility of cargo carriers as regards schedules and the possibility to use alternative airports, as shown by the market investigation. The Commission has found that companies operating freighter aircrafts can easily enter new routes in response to demand. As a matter of fact new entrants have entered some of the above routes. Moreover, the market investigation indicated that there is available capacity on the market.
- (288) Finally, the market investigation revealed that contracts are normally concluded for a short duration (six months to a year) and with no exclusivity clause, which allows customers to switch easily between different suppliers.
- (289) In the light of the above, the proposed transaction would not significantly impede effective competition on any of these markets.

C. Supply of airline seats to tour operators

- (290) Both LH and OS sell airline seats to tour operators. In addition, LH exercises, together with Turkish Airlines, joint control over the airline SunExpress, which sells seats to tour

operators and is active in both Germany and Austria. LH and OS are selling more seats to tour operators on short- and medium-haul flights than on long-haul flights.

- (291) The notifying party estimates the size of the market of supply of airline seats to tour operators on short- and medium-haul flights in 2008 at [0-5]* million seats sold in Austria and [20-30]* million seats sold in Germany; a combined Austria-Germany market would thus amount to [20-30]* million seats in 2008.
- (292) On the basis of a combined Austrian-German market for short- and medium-haul flights, the combined market share of the parties would be [10-20]*% (LH [5-10]*%¹³⁹/SunExpress [0-5]*% and OS [0-5]*%). For the German market, OS has a market share of [0-5]*% and LH [5-10]*%/SunExpress [0-5]*%. The combined market share would be [5-10]*%. Neither a combined Austrian-German market nor a German market for short- and medium-haul flights would be technically affected as the combined market share of the parties is below [10-20]*%.
- (293) On an Austrian market for short- and medium-haul flights, OS has a market share of [30-40]*%, LH has a market share of [0-5]*% and Sun Express has a market share of [5-10]*%. The combined market share of the parties would be [40-50]*%. The notifying party estimated that the biggest competitor, FlyNiki, also has a market share of [40-50]*%.¹⁴⁰ Further competitors Tunis Air and Nouvel Air have market shares of around [5-10]*% each.
- (294) The market of the supply of airline seats to tour operators on long-haul flights was estimated by the notifying party at [300 000 – 350 000]* seats sold in Austria and [3 500 000 – 4 000 000]* seats sold in Germany. A combined market Austria-Germany would thus amount to [3 500 000 – 4 000 000]* seats in 2008.
- (295) The combined market shares of the parties on a German, Austrian and a combined Austrian-German market for long-haul flights are in all three cases between [5-10]*% and [5-10]*% and thus below [10-20]*%. On this basis, the markets are technically not affected.
- (296) In the market investigation, some competitors pointed to a strengthening of the position of the combined entity. While some customers indicated that they see a risk of reduction of OS services following the transaction as well as a possible worsening of competitive conditions offered to tour operators, the majority of customers did not see any major impact on their activities.
- (297) In view of the above, and in particular due to the strong market presence of FlyNiki in the Austrian market and the relatively small increment brought about by the transaction, the proposed transaction would not significantly impede effective competition on the market for the supply of airline seats to tour operators.

139 The market share of LH entails a [0-5]*% market share of 4U which is only active in the German market for wholesale supply of airline seats to tour operators.

140 The market investigation suggests that the parties overestimated their own market shares.

D. MRO services

- (298) LH is active in MRO through its wholly-owned subsidiary Lufthansa Technik ("LHT") and provides line maintenance, heavy maintenance, components maintenance and engine maintenance services. OS is active in the provision of line maintenance for its own fleet and for several third party customers through Austrian Technik. OS also provides limited heavy maintenance services at VIE airport and BTS airport and limited components maintenance services at VIE airport.
- (299) With regard to heavy maintenance, components maintenance and engine maintenance services, the overlap between the parties' activities is marginal, in light of the fact that OS' market shares both at a world-wide level and at a European level do not exceed [0-5]*%. Moreover, in a market characterized by the presence of many important providers of MRO services (such as Air France Industries, KLM Engineering, SAS Components, British Airways Engineering & Maintenance as well as independent providers such as SR Technik, Aveos, Delta Tech Ops and others), the combined entity's market shares will not exceed [10-20]*% in any of the relevant markets. In light of the limited market shares of the parties, the transaction does not raise any vertical issue.
- (300) With regard to line maintenance, OS is only active in Austria, where LH does not operate. Consequently, no horizontal overlap arises between the parties' activities. With respect to vertical issues, it should be noted that Austrian Technik provides limited line maintenance services to LH: at VIE airport the line maintenance services provided by Austrian Technik to LH represent only [5-10]*% of the line maintenance services provided to third customers. Similarly, the line maintenance services provided to OS represents a limited percentage of LHT line maintenance services in each of the airports where LHT is active: with regard to German airports, the line maintenance services provided by LH to OS represent [0-5]*% of all line maintenance services provided to third customers in Germany. Moreover, LHT only accounts for 10 to 20% of the line maintenance provided out of BRU airport and does not provide line maintenance to OS, while SN does not provide MRO services to third parties.¹⁴¹ Consequently, the transaction will only have limited effects on those markets. For these reasons, the Commission considers that the transaction will not lead to any foreclosure by the parties in these markets.
- (301) In light of the above the proposed transaction would not significantly impede effective competition on any of the above markets for MRO services.

E. In-flight catering

- (302) LH is active in the in-flight catering markets through LSG Lufthansa Service Holding AG ("LSG"), operating under the brand name LSG SkyChefs, which provides catering services

¹⁴¹ With the exception of one or two customers per year and limited to Avro aircrafts.

to LH as well as to third party customers. OS does not have any activities in these markets but purchases catering services from external suppliers.

- (303) As mentioned in the market definition (section V of this Decision), the Commission has recently found that new types of in-flight catering services have come to existence. However, as LH is only active in the traditional catering services, the following analysis only refers to that segment.
- (304) With regard to vertical relationships between the parties, LSG used to provide catering to OS at several European airports but since October 2008 the latter has opted for return catering for all its short- and medium-haul flights, loading catering for both outbound and inbound flights at Vienna. In any event, the transaction will only have limited effects on those markets. In 2008, LGS accounted for approximately [0-5]*% of OS' total catering costs; moreover, the percentage of in-flight catering provided to OS represented a small percentage of LSG overall in-flight catering sales at each of the airports where LSG used to provide catering to OS (such percentage was below [0-5]*% at the majority of these airports and did not exceed [5-10]*% at any of them). For these reasons, the Commission considers that the transaction will not lead to any foreclosure by LH in these markets.
- (305) In light of the above, the proposed transaction would not significantly impede effective competition on the market for in-flight catering.

F. Groundhandling

- (306) Through local groundhandling companies, LH is active at Dresden airport, Leipzig airport, Friedrichshafen airport, and MUC airport. OS provides groundhandling services mainly at VIE airport and to some limited extent at other airports in Austria and abroad.
- (307) The parties' groundhandling activities do not overlap at any airport. On the other hand, the parties provide groundhandling services to one another at some airports. Within the EU, OS provides services to LH at VIE airport and at Timisoara airport, while LH provides services to OS at MUC airport and Dresden airport.
- (308) In light of the significant presence of the parties on the downstream market of scheduled air passenger transport, the markets for ground-handling at VIE, MUC and Dresden airports are considered vertically affected markets. However, it should be noted that at each of these airports, the parties' market shares in the markets for groundhandling never exceed 15%.
- (309) At VIE airport, OS' market shares in the groundhandling segment do not exceed [0-5]*% while many other effective competitors are active at that airport, such as Fraport Ground Services Austria GmbH and Flughafen Wien AG which operates VIE Airport and is the main provider of ground-handling services.
- (310) Similarly, the dominant provider of groundhandling services at MUC airport is the operator of the airport, Flughafen München GmbH, with a market share of [80-90]*%, while other competitors such as Aviapartner GmbH, Aerogate München Gesellschaft für

Luftverkehrsabfertigungen mbH and AHS Aviation Handling Services GmbH are also active. Consequently LH's market share at MUC airport is only marginal.

- (311) At Dresden airport, the main provider of groundhandling services is PortGround GmbH, an indirect subsidiary of the operator of the airport, which provides ramp handling services. Passenger handling services are provided by AHS Aviation Handling Services GmbH and Lufthansa Airport Services Dresden GmbH. The latter's market shares do not exceed 15%.
- (312) In light of the above the proposed transaction would not significantly impede effective competition on the market for groundhandling.

G. Impact of State aid granted to OS on effective competition

- (313) The Commission approved EUR 200 million rescue aid for OS on 19 January 2009.¹⁴² This rescue aid consisted of a cash deposit of EUR 200 million provided by ÖIAG in order to secure a EUR 200 million term loan facility for OS [...]*.
- (314) Furthermore, ÖIAG and LH have agreed that ÖIAG will grant EUR 500 million for a capital increase in OS.
- (315) By Decision adopted by the Commission on the same day as this Decision, the Commission has found that the granting of EUR 500 million by ÖIAG constitutes restructuring aid in favour of OS.¹⁴³ As a further consequence of this Decision, the rescue aid will have to be brought to an end.¹⁴⁴
- (316) This Decision needs to take into account the consequences which the rescue aid and the restructuring aid in favour of OS may have on the maintenance of effective competition in the markets described in sections A to F above.¹⁴⁵
- (317) Such additional funds at OS' disposal could strengthen its commercial position. However, it is to be recalled that OS is at present in a dire financial situation. Indeed, on 19 December 2008 Austria notified the Commission of its decision to grant rescue aid to the OS Group. On 22 December 2008 the Commission learned that a first tranche of EUR 67 million of this rescue aid was granted to OS to allow it to continue operations, before the Commission could take a position on its compatibility with the common market.
- (318) OS' perilous financial situation is further illustrated by the fact that any stand-alone OS operation would require additional funding, extending significantly beyond the amount of the rescue aid and the restructuring aid.¹⁴⁶ Furthermore, the rescue aid of EUR 200 million

142 Commission Decision of 19 January 2009 on State aid NN 72/2008, Austrian Airlines – Rescue aid.

143 Commission decision of on State aid C 6/2009.

144 Commission Decision of 19 January 2009 on State aid NN 72/2008, Austrian Airlines – Rescue aid, paragraph 71.

145 CFI, Case T-156/98 RJB Mining, of 31 January 2001 ECR (2001), II-337, paragraph 114, CFI, Case T-374/00 Verband der freien Rohrwerke and Others v Commission, of 8 July 2003, ECR (2003), II-2275, paragraph 169, and CFI, Case T-114/02 BaByliss v Commission, of 3 April 2003, ECR (2003), II-1279, paragraphs 440-441.

146 According to OS internal document [...]*.

has to a very large extent already been exhausted by OS in order to repay aircraft financing.¹⁴⁷

- (319) The extent of OS' financial needs is in line with the findings in Commission Decision C6/2009 adopted on the same day as this Decision, according to which the overall cost of restructuring OS exceeds EUR 500 million very significantly.¹⁴⁸
- (320) Against this background, OS is unlikely to have used or to use the rescue aid and the restructuring aid in a way that would call into question any of the findings in sections A to F above, such as preventing the expansion of competitors. Both the rescue and the restructuring aid aim at rendering the acquisition of OS by LH economically sustainable, in particular at securing the liquidity for OS, reducing its liabilities and restoring its profitability in the long term. The use of these funds by OS will also be monitored by the Commission in the future.¹⁴⁹
- (321) The rescue and restructuring aid at issue therefore primarily serve the purpose of helping to ensure the survival of OS.¹⁵⁰ Due to this purpose and due to their low level compared to the overall financial need of OS, it follows that none of the conclusions mentioned in sections A to F above are altered by the rescue and restructuring aid.
- (322) That conclusion is further underlined by the strong financial position of LH. Indeed, LH achieved operating results above EUR 1 billion both in 2007 and 2008 and had a total liquidity of EUR 5.2 billion (out of which a strategic minimum liquidity of EUR 2 billion) on 31 March 2009.¹⁵¹ Compared to such financial strength, any impact of the rescue and restructuring aid on the overall strength of the merged entity is limited.
- (323) In addition to all these reasons, with regard more in particular to the VIE-BRU, VIE-STR, VIE-CGN, VIE-FRA and VIE-MUC routes, the conclusion remains unchanged that the proposed transaction raises serious doubts as to its compatibility with the common market because it may significantly impede effective competition on these routes.
- (324) As regards all other markets mentioned in sections A to F above, for the reasons set out in this section, the State aid will not lead to any significant impediment of effective competition. With regard more in particular to the Vienna-Berlin, Vienna-Düsseldorf, Vienna-Hamburg, Vienna-Hannover, Vienna-Nuremberg, Munich-Linz, Vienna-Zurich and Vienna-London routes as well as the cargo markets, the markets for supply of airline seats to tour operators, MRO services, in-flight catering and groundhandling, it is to be further underlined that strong competitors are present on these markets.

147 According to OS internal document [...]*.

148 See paragraph 307 of the Commission decision on State aid C 6/2009.

149 Pursuant to Article 2(5) of Commission Decision C6/2009, the Commission shall until 2015 be provided with annual reports on the implementation of the restructuring plan assessed in that Decision.

150 Accordingly, clause 2 of the Amendment and Waiver Agreement between the Parties states that the amount of EUR 500 million is granted "for the purpose of financial restructuring". See also paragraph 268 of the Commission decision on State aid C 6/2009.

151 See LH financial outlook of 25 June 2009, accessible at <http://investor-relations.lufthansa.com/fileadmin/downloads/en/charts-speeches/LH-Financial-Outlook-2009-06-25-e.pdf>.

(325) Furthermore, as regards the direct-direct routes which are only served by one of the parties, the market investigation has not revealed that the granting of the additional funds to OS would change the findings in relation specifically to these routes, that is to say that the transaction would lead to the elimination of potential competition. On the contrary, the main reasons why no competition concerns arise in relation to these routes (namely low demand on most of these routes, entry strategies of LH and OS as evidenced by internal documents, absence of parallel operations pre-co-operation on almost all of these routes) apply irrespectively of the State aids at issue. Furthermore, with regard more in particular to the entry strategy of OS, the market investigation did not reveal any indications that OS would change its entry strategy in view of the additional funds at issue, which is also evidenced by the fact that OS already exhausted almost all the rescue aid without changing its entry strategy. It is therefore unlikely that OS would use any such additional funds to enter these routes.

VIII. EFFICIENCIES

(326) While the notifying party argues that the proposed transaction will likely generate significant cost savings and other efficiency gains for the benefit of consumers, LH has not put forward any evidence in support of such efficiencies. In particular, LH merely notes that small carriers such as OS suffer from inherent competitive disadvantages in areas such as fleet optimization and that without the transaction, OS would likely have to discontinue or at least massively reduce its activities. At the same time, LH points to its successful integration of LX and argues that the transaction will have comparable benefits to OS and its customers as LX' turnaround had on LX and its customers. As set out in the Horizontal Merger Guidelines, the three following cumulative conditions apply: (i) the efficiencies will benefit consumers, (ii) the efficiencies are merger specific and (iii) the efficiencies are verifiable. LH's broad claims clearly do not provide the necessary evidence for the Commission to accept that these three conditions are satisfied. It is thus concluded that there is not sufficient evidence that the efficiencies are verifiable, merger-specific, and that they would benefit consumers. Consequently, the Commission rejects the claim that efficiencies generated by the merger counteract the negative effects on competition identified in Section VII.

IX. COMMITMENTS SUBMITTED BY LH

(327) In order to address the competition concerns identified by the Commission during its market investigation on the VIE-STR, VIE-CGN, VIE-MUC, VIE-FRA, and VIE-BRU routes, LH submitted commitments on 10 July 2009 pursuant to Article 8(2) of the Merger Regulation. On 17 July 2009 and 27 July 2009, LH submitted revised versions of the commitments. Further to the submission of the revised version of the commitments on 27 July 2009, the Commission launched a market test in order to gather the opinion of competitors and customers on these commitments. In light of the results of the market test, LH presented a final version of commitments on 31 July 2009 ("the Commitments"), which addressed weaknesses identified in its previous proposal.

(328) The Commitments submitted by LH aim at reducing the barriers to entry and at facilitating entry of (a) New Entrant(s) or expansion of competitors already present on any

of the above-mentioned routes. The Commitments comprise a number of measures and consist, in particular, in the release and transfer of a number of slots at the airports in Vienna, Stuttgart, Cologne/Bonn, Munich, Frankfurt and Brussels, as well as several ancillary measures.

A. Description of the Commitments

(1) Commitments concerning slots

a. Slot release on city pairs with competition concerns

(329) Under the Commitments, the parties commit to make slots¹⁵² available, according to a specific procedure, at the airports in Vienna, Stuttgart, Cologne/Bonn, Munich, Frankfurt and Brussels on the five routes on which the Commission identified competition concerns¹⁵³ (hereafter the "Identified City Pairs").

(330) The number of slots to be made available shall enable a New Air Service Provider¹⁵⁴ (hereafter also referred to as the "New Entrant") to operate the following numbers of frequencies on the Identified City Pairs:

(i) VIE-STR: up to three (3) frequencies per day;

(ii) VIE-CGN: up to three (3) frequencies per day, but not more than 18 frequencies per week;

(iii) VIE-FRA: up to five (5) frequencies per day;

(iv) VIE-MUC: up to four (4) frequencies per day;

(v) VIE-BRU: up to four (4) frequencies per day, but not more than 24 frequencies per week.

(331) The number of slots will be reduced by the number of slots already transferred to a New Entrant under the Commitments, unless these slots cease to be served by the New Entrant and revert subsequently to the parties.

(332) With regard to all Identified City Pairs except for VIE-FRA and VIE-MUC, where specific provisions apply, frequencies already served by an airline independent of or

152 That is to say, a permission given to an aircraft to use infrastructure at a given airport on a specific date and time for the purpose of landing and take-off.

153 These are routes between the following city pairs: VIE-STR, VIE-CGN, VIE-MUC, VIE-FRA and VIE-BRU.

154 Defined as "Any airline or airlines that are each members of the same alliance (other than the Parties including all airlines controlling it/them or controlled by it/them), that individually, or collectively by Codeshare, provide(s) a new or additional Competitive Air Service". 4U or any other carriers controlled by the parties at any time during the application of the Commitments are not considered as eligible to obtain slots under the Commitments.

unconnected to the parties on an Identified City Pair shall be counted against the number of slots to be made available by the parties to that airline under the Commitments.

- (333) With regard to the VIE-FRA route, the two daily frequencies currently operated by Niki (three frequencies to the extent that Niki obtains a third slot from LH as from the IATA Winter Season 2009/2010) will be deducted from the number of slots to be made available under the Commitments. If Niki were to exit one or more of these frequencies in advance of acquiring grandfathering rights, such frequencies will be made available to New Entrants under the Commitments.
- (334) Niki will be entitled to exchange the slots it received from LH in Frankfurt according to the existing slot lease agreement between LH and Niki against slots, which LH makes available under the Commitments. However, in order to take LH's wave structure at FRA airport into account, LH shall not be obliged to transfer to Niki more than one slot at FRA airport during each of the following time periods:¹⁵⁵

Arrival	Departure
05:35 - 08:00	06:30 - 08:15
08:05 - 10:20	08:20 - 11:35
10:25 - 14:00	11:40 - 15:05
14:05 - 15:30	15:10 - 16:15
15:35 - 17:50	16:20 - 19:45
17:55 - 21:50	19:50 - 22:25

- (335) Furthermore and regardless of whether Niki opts for obtaining new slots from the parties in exchange for its current slots at FRA airport,¹⁵⁶ LH undertakes to amend its existing slot lease agreement with Niki to reflect the provisions of the Commitments, in particular as regards the possibility for Niki to acquire grandfathering rights with regard to these slots, as described in more detail in paragraph (342) (whereby the period necessary to obtain grandfathering rights foreseen in the Commitments will begin with the start of the IATA Winter Season 2009/2010).
- (336) In addition, and only if no applicant that is not member of Star Alliance requests a remedy slot for the IATA Summer season 2010 (or the first season for which the procedures for implementation of the Commitments would be in place, whichever is the later) one frequency operated by Adria Airways will be deducted from the number of slots to be made available under the Commitments. Such a deduction would initially apply for a period of four consecutive IATA seasons and for every subsequent period of two years until a Non-Star Alliance applicant requests a remedy slot.

¹⁵⁵ If Niki already has two slots in one time period, LH shall be obliged to grant any request by Niki to exchange up to two slots in that time period, but shall be entitled to ensure that the relevant slots are at least 105 minutes apart.

¹⁵⁶ Niki may retain any or all of its existing slots for which it would not seek an exchange.

- (337) Moreover, LH undertakes to amend its existing agreements with Adria Airways with respect to one slot to reflect the provisions of the Commitments, provided however that Adria Airways shall not acquire grandfathering rights.
- (338) With respect to the VIE-MUC route, where Niki currently operates three daily frequencies for which it received slots via the normal slot allocation procedure, the Commitments provide that Niki will be entitled to exchange its current slots on this route against slots which LH makes available under the Commitments. Regardless of whether or not Niki decides to re-time its current slots under the Commitments, Niki's frequencies shall be deducted from the total number of slots to be made available by the parties on this route. If Niki were to exit from one or more of its frequencies,¹⁵⁷ such frequencies will be made available to New Entrants under the Commitments.
- (339) Finally, with respect to the routes VIE-STR and VIE-CGN, LH is already obliged to make slots available to New Entrants on the basis of a previous merger decision, namely the Commission's Decision in case COMP/M.3940 – Lufthansa/Eurowings.¹⁵⁸ To the extent that the parties have already made slots available to a New Entrant pursuant to the commitments in that case, such slots will be counted against the number of slots to be made available pursuant to the Commitments in this case. New Entrants will be able to choose slots for these two routes pursuant to which commitments they want to apply, namely those submitted in the previous case or those submitted in this case.

b. Conditions pertaining to the slot transfer

- (340) The slot transfer procedure foreseen by the Commitments will run in parallel with the normal slot allocation procedure. An airline wishing to obtain slots on one of the Identified City Pairs will request slots through the normal slot allocation procedure and apply for a slot transfer under the Commitments at the same time. If the applicant's slot request to the slot coordinator is not met as a result of the IATA Scheduling Conference, the Commitments provide that the parties must offer to transfer the requested slots to the applicant within one week following the applicant's commitment to operate them. Slots must be released free of charge and within 20 minutes of the time requested by the applicant if either of the parties has slots available in this timeframe. Otherwise, the parties must offer the slots closest in time to the applicant's request.
- (341) The slot lease agreement between the parties and the applicant must be signed and the transfer performed within three weeks after the Slot Handback Deadline, which is 15 January for the IATA Summer season and 15 August for the IATA Winter season. The slot lease agreement will have a duration equal to the Utilization Period of the relevant Identified City Pair,¹⁵⁹ but the New Entrant will have the right to terminate the agreement at the end of

157 As regards slot obtained by Niki under the present Commitments, this only applies if Niki has not yet obtained grandfathering rights at the time of its exit.

158 Case No. COMP/M.3940 – Lufthansa/Eurowings.

159 I.e. two consecutive IATA seasons for all Identified City Pairs except for the route VIE-FRA, and eight consecutive IATA seasons for VIE-FRA.

each IATA season without penalty. Finally, the Commitments provide that a New Entrant who decides to operate the greatest number of routes will be favoured.¹⁶⁰

c. Grandfathering rights

(342) The Commitments also provide for the New Entrants' possibility to acquire grandfathering rights in relation to slots obtained from the parties. The New Entrant will obtain grandfathering rights over these slots, that is to say, will be entitled to use the slots transferred from the parties at both ends of any Identified City Pair for a different intra-European city pair than the Identified City Pairs, once it has served the relevant Identified City Pair(s) during two full consecutive IATA seasons for all Identified City Pairs except for the VIE-FRA route; and eight consecutive IATA seasons for the VIE-FRA route (respectively, the "Utilization Period"). By contrast, if the New Entrant ceases to operate the slots transferred in the relevant Identified City Pair before the end of the Utilization Period, these slots will be handed back to LH and will be made available under the Commitments for another New Entrant.

d. Star Alliance members as New Entrants

(343) The above described provisions are only fully applicable to New Entrants which are not members of Star Alliance.

(344) In principle, Star Alliance members can also obtain slots in the framework of the Commitments but non-Star Alliance members will be given a higher priority if several potential entrants apply for slots on the same route under the Commitments. Priority will always be given to a non Star Alliance applicant, that is, even if the Star Alliance Member applies for a larger number of routes than a non-Star Alliance applicant.

(345) Furthermore, a Star Alliance entrant will not have the possibility to acquire grandfathering rights in relation to slots obtained from the parties. A Star Alliance entrant will not be able to enter into code-share agreements or revenue-sharing/profit-sharing joint ventures with the parties or other Star Alliance partners on the Identified City Pairs. When the Star Alliance member ceases operating any of the slots released under the Commitments, the parties have to offer these slots to New Entrants again.

(346) Lastly, if a Star Alliance member obtains slots under the Commitments, specific conditions can be imposed by the Commission, notably to guarantee the independence of the Star Alliance applicant from the parties.

¹⁶⁰ This applies only in case there are at least two applicants that are not member of Star Alliance.

(2) *Other commitments and other provisions*

a. *Special prorate and code-share agreements*

(347) The Commitments offer a New Entrant the possibility to enter into a special prorate and code-share agreement allowing the New Entrant to place its codes on flights with a true origin and destination in either Austria, Germany and/or Belgium, provided part of the journey involves an Identified City Pair. The conditions of such a special prorate agreement shall be such that the New Entrant has equal treatment with LH's Star Alliance partners on the same Identified City Pair.

b. *Other provisions*

(348) The slot release commitments are supplemented by other commitments such as the possibility for a New Entrant to conclude interlining and Frequent Flyer Programme access agreements with the parties as well as intermodal agreements with a railway or other surface transport company.

(349) The Commitments foresee the appointment of a Monitoring Trustee who will monitor the parties' compliance with the Commitments and will assist the Commission during the slot transfer procedure provided for by the Commitments.

(350) The Commitments also contain provisions on fast-track dispute resolution according to which the New Entrant can decide to settle any dispute with the parties in relation to the Commitments through arbitration. Both the New Entrant and the parties will then be bound by the arbitration decision. The burden of proof in any dispute requires the New Entrant to provide *prima facie* evidence of its case and the parties to provide evidence to the contrary.

(351) The Commitments, in particular the obligation of slot transfer, are indefinite in time but contain a review clause.

B. Analysis of the Commitments

(352) Concerning the suitability of commitments aiming at facilitating entry of a new competitor, the Commission notice on remedies acceptable under the Merger Regulation and under Commission Regulation (EC) No 802/2004¹⁶¹ ("the Commission notice on remedies") states that "[o]ften, a sufficient reduction of entry barriers is not achieved by individual measures, but by [...] a commitments package aimed at overall facilitating entry of competitors by a whole range of different measures."

(353) The Commitments submitted by the notifying party constitute a comprehensive package which takes into consideration past experience with commitments in merger cases in the

¹⁶¹ OJ C 267, 22.10.2008, p. 1.

aviation sector. The Commitments have generally received a positive evaluation from the competitors, customers and other market participants who replied to the market test.

(1) *Slots*

(354) The Commitments take account of the fact that slot congestion is the main entry barrier on the problematic routes in this case. In effect, with the exception of CGN airport, which is a "Schedules Facilitated" airport,¹⁶² all the airports concerned by the Identified City Pairs are congested (and in some cases heavily so). In the light of this, the Commitments are designed to remove this barrier and foster entry on the routes where competition concerns were identified.¹⁶³

a. *Number of slots*

(355) The slots made available by the parties will enable existing competitors or one or more New Entrants to sufficiently replace the competitive pressure between the parties that is eliminated by the proposed transaction.¹⁶⁴

(356) Concerning all Identified City Pairs the market test has largely confirmed that the number of slots offered in the Commitments is sufficient for another player(s) who will offer new or additional frequencies to effectively compete with the parties.

(357) Some respondents have voiced concerns with regard to the fact that the Commitments foresee a deduction of frequencies of existing players on the VIE-FRA and VIE-MUC routes from the number of slots to be made available under the Commitments for these routes and thus limit in particular entry on these routes.

(358) However, both the VIE-FRA and the VIE-MUC route present particular circumstances which justify such a deduction of frequencies of existing players in this case:

Vienna-Frankfurt

(359) As regards the VIE-FRA route, it should be noted that both Niki and Adria Airways have entered this route on the basis of slots that LH made available to these players with a view to

162 A "scheduled facilitated airport" is an airport with potential for congestion but which is amenable to resolution by voluntary co-operation between air carriers and where a schedules facilitator has been appointed to facilitate the operations of current and intended operators at that airport.

163 Although CGN airport is not coordinated, VIE airport is congested with slot shortage during peak times. The slot pairs offered on the VIE-CGN route will therefore also serve to facilitate entry on this route, notably at VIE airport.

164 In this regard, it should be noted at the outset that the level of frequencies presently operated by the parties does not result from an independent operation pre-merger, but is primarily based on a "divisions of tasks" in the framework of their joint venture co-operation. Indeed, the parties' joint venture co-operation has for operational reasons led at various instances to a change of operating carriers and/or level of frequencies operated by both parties (See for example Form CO p. 63, "LH/AUA Self-Assessment" p. 4 and reply of the parties to question 21 of request for information of 27 April 2009). It follows that the level of frequencies currently operated by the parties only has a limited relevance for the level of frequencies required under the Commitments in order to remove the serious doubts identified for the relevant routes.

complying with Community competition rules. As explained in paragraph (65), the Commission exemption decision of 2002 essentially consisted in a commitment of the parties to make slots available to (a) New Entrant(s) for any Austria-Germany route chosen by it/them up to a maximum of 40% of the slots that LH and OS operated on the route in question. LH appears to have made available slots to Adria Airways in 2001 by means of a lease agreement in view of the imminent exemption decision.¹⁶⁵ Similarly, as explained above in paragraph (162), Niki entered the route in 2006 on the basis of two slots at FRA airport which LH transferred to Niki by means of a lease agreement with a view to complying with Article 81 of the Treaty following the parties' self-assessment, and it recently received a further slot from LH in order to operate a third frequency on the route as of the winter season 2009/2010.

(360) As the slots currently used by Niki were thus effectively made available by LH, it appears justified to deduct Niki's frequencies from the number of slots to be made available under the Commitments, subject to the further provisions in the Commitments (such as the possibility of re-timing). For the same reason, and taking into account the fact that the competitive constraint emanating from Adria Airways upon the parties is limited, it appears justified to further deduct one frequency of Adria Airways, subject to the further provisions in the Commitments (temporary restriction of such a deduction etc.). However, such a deduction of an Adria Airways' slot only takes place unless an applicant that is not member of Star Alliance submits a slot request for the summer season 2010.¹⁶⁶ In addition, the deduction of an Adria Airways' slot is not permanent but New Entrants have the opportunity to apply for that slot every four IATA seasons or in case Adria Airways ceases its operations on the VIE-FRA route.

(361) This conclusion is reinforced by the fact that the Commitments on VIE-FRA are designed so as to allow either expansion of Niki, which could obtain up to two additional slots in addition to the three slots already transferred to it, or entry of a new player with two frequencies, subject to the circumstances outlined above.¹⁶⁷

(362) These considerations are confirmed by the positive overall assessment of the remedies for this route in the market test. Indeed, a majority of respondents take the overall view that the Commitments will enable Niki and/or a New Entrant to provide a competitive and viable air service on the VIE-FRA route. Furthermore, respondents widely agree that the Commitments overall sufficiently facilitate and increase the likelihood of entry/expansion, and thus solve the competition concerns on the VIE-FRA route.

Vienna-Munich

(363) As regards the VIE-MUC route, it is to be recalled that Niki already operates the route with three frequencies which it obtained under the normal slot allocation procedure. In order to assess the impact of a deduction of Niki's existing frequencies on the effectiveness of the

165 See reply to request for information to Adria Airways of 22 July 2009.

166 Or the first season whereby the procedures for implementation of the present Commitments would be in place.

167 In particular, in order to receive more than one additional slot, Niki and/or a new entrant need to apply for remedy slots for the IATA season summer 2010 or periods of two years afterwards.

Commitments, it is illustrative to distinguish the situations in which Niki may either wish (i) to expand its existing services; (ii) to exit the route; or (iii) to maintain the current level of frequencies.

(i) With regard to an expansion of Niki's existing services, it should be recalled that according to the findings of the market investigation mentioned in paragraphs (147) et seq., Niki does not represent a sufficient competitive constraint on the parties, due in particular to the timing of its flights and the number of its frequencies. The Commitments allow Niki both to obtain an additional slot as well as to re-time all of its existing frequencies and therefore sufficiently address the shortcomings of Niki's existing services on the route. Accordingly, almost all respondents to the market test consider that the Commitments enable Niki to provide a viable and competitive air service.

(ii) If Niki decided to leave the route, the Commitments would enable (a) New Entrant(s) to enter the route with up to four frequencies, thus allowing the New Entrant(s) to provide a viable and competitive air service.

(iii) If Niki decided to maintain its current level of frequencies, any New Entrant would only be able to obtain one slot under the Commitments. While the provision of competitive air services in particular for time sensitive passengers generally requires more than one daily frequency, it should be noted, as mentioned in footnote 80 above that MUC airport expects significant capacity extensions to be in place in the near future. In particular, a third runway is currently in the second phase of an extensive approval process and is expected to be operational as of 2011. This third runway will increase co-ordination of up to 120 movements per hour compared to 90 movements per hour with the existing two-runway system and will be available to both terminals at MUC airport. These planned capacity extensions increase the likelihood that New Entrants would in the near future (in particular once the economic climate for air transport services referred to below in paragraphs (384) and seq. has improved) be able to obtain slots under the normal slot allocation procedure.¹⁶⁸ At the same time, they can obtain one slot under the Commitments in relation to which they can have grandfathering rights after two seasons and which will therefore further incentivise them to enter the route.

(364) The Commission considers that these elements taken together justify a deduction of Niki's existing frequencies from the slots to be made available under the Commitments and will therefore allow Niki and a New Entrant to adequately reproduce the constraining effect that LH and OS would exercise upon each other in the absence of the transaction.

(365) Those conclusions are further in line with the overall assessment of the remedies for this route in the market test. In particular, respondents widely agree that the Commitments solve the competition concerns on the VIE-MUC route. Furthermore, a majority of respondents take the view that the Commitments overall sufficiently facilitate and increase the likelihood of entry/expansion, and thus enable Niki and/or a New Entrant to provide a competitive and viable air service on the route.

¹⁶⁸ In this context it should be noted that Niki was able to commence its services on the VIE-MUC route in 2007 on the basis of slots it has obtained in the normal slot allocation procedure.

b. Allocation of slots

- (366) The slots must be allocated within only 20 minutes from the initial request which allows tightly adjusted schedules in order to ensure short turnaround times. Furthermore, apart from LH's wave structure at FRA airport referred to in paragraph (334), the Commitments contain no limitations concerning the transfer of slots in peak times, which increases the attractiveness of the slots offered. Moreover, the Commitments contain more convenient and efficient procedures for the allocation of slots than the procedures foreseen by remedies in previous airline merger cases. The enhanced slot allocation mechanism in this case enables New Entrants to submit their slot allocation requests much earlier in the season, thus giving such New Entrants sufficient time to launch and market their new services.
- (367) Moreover, already for the duration of the slot lease agreement and, in any case, once the New Entrant has acquired grandfathering rights, it will not have to go through the slot allocation procedure provided for in the Commitments every season.¹⁶⁹ The market test has confirmed the efficiency of the slot allocation mechanism proposed. In fact, a large majority of the respondents considered that the procedure foreseen by the proposed remedies for the slot release would allow a New Entrant to obtain the required slots in a timely and satisfactory manner.

c. Possibility for Niki to exchange slots on the Vienna-Frankfurt and Vienna-Munich routes and amendment of existing slot lease agreement regarding the Vienna-Frankfurt route so as to include the provisions of the Commitments

- (368) The Commitments provide that Niki will be entitled to exchange its current slots on the VIE-FRA and VIE-MUC routes against slots which LH makes available under the Commitments and that the existing slot lease agreement between LH and Niki for the VIE-FRA route will be amended so as to reflect the provisions in the Commitments (in particular, concerning the possibility of Niki to acquire grandfathering rights). These provisions enable Niki to better adapt the timing of its slots to demand and to improve its current offer and market position on both routes. As a result, Niki's offer is likely to become more attractive and Niki will be able to exert increased competitive pressure on the parties.
- (369) While the possibility for Niki to exchange its current slots for the VIE-FRA route is restricted by Section 1.1.3(iii) of the Commitments in view of LH's wave structure at FRA airport, that is, that LH shall not be obliged to transfer to Niki more than one slot at FRA airport during each wave as defined in that Section, the revised version of the Commitments of 31 July 2009 introduced several improvements in that regard.
- (370) First of all, if Niki already has two slots in one time period, LH shall be obliged to grant any request by Niki to exchange up to two slots in that time period, but shall be entitled to ensure that the relevant slots are at least 105 minutes apart. This ensures that Niki will be able to maintain its two slots in the attractive afternoon/evening wave (from 16.20 to 19.45) and to re-time all its existing slots.

¹⁶⁹ This is of particular relevance for the VIE-FRA route where the Utilization Period necessary for grandfathering is eight IATA seasons.

(371) Furthermore, the revised Commitments of 31 July 2009 clarify that Niki will also be free to retime any or all of its slots.¹⁷⁰

(372) These improvements ensure the effectiveness of the re-timing provisions on the route VIE-FRA.

d. Grandfathering rights

(373) The attractiveness of the Commitments is also enhanced by the prospect of acquiring grandfathering rights after a Utilization Period of only two full consecutive IATA seasons for slots on all Identified City Pairs except the VIE-FRA route, and eight full consecutive IATA seasons for the VIE-FRA route. Granting of grandfathering rights represents an additional incentive for New Entrants to enter on the Identified City Pairs as slots are particularly valuable assets especially at FRA, VIE and MUC airports due to considerable slot constraints at these airports.

(374) As regards the VIE-FRA route, while some respondents have voiced concerns as regards the length of this period, the longer Utilisation Period is justified by the higher value of the slots at FRA airport, which in turn increases the risk that an entrant would enter on the VIE-FRA route merely to obtain these valuable slots and to use them subsequently on other routes.¹⁷¹ Indeed, the market investigation revealed that FRA airport is far more congested than any other airport subject to the Commitments (see paragraph (182)) and in order to ensure utilisation of the slots to be made available by LH at FRA airport on the very route VIE-FRA a longer utilisation period appears to be justified. Furthermore, in line with previous Commission decision practice,¹⁷² a Star Alliance entrant will not have the possibility to acquire grandfathering rights in relation to slots obtained from the parties.

(375) The majority of the respondents to the market test confirmed that they consider the Utilization Period proposed in the Commitments after which grandfathering rights will be granted to the New Entrant as adequate.

(2) Other commitments and other provisions

a. Special prorata and code-share agreement

(376) Many respondents to the market test considered the possibility offered to the New Entrant(s) to enter into a special prorata and code-share agreement with the parties as an additional incentive to enter on the Identified City Pairs, while several other respondents only see limited added value in such agreements.

170 In addition, the revised Commitments of 31 July 2009 provide, with regard to the interaction of the "20 minute-rule" (see paragraph (340)) and LH's wave structure, that, in case a slot is granted by LH in a different wave than in which Niki had requested it, such a slot will be deemed to be granted in the time period in which Niki had requested it. This ensures that the "20 minute-rule" will not have a negative impact on the ability of Niki to obtain slots in LH's wave structure.

171 See also Case No. COMP/M.5335 – Lufthansa/SN Airholding, paragraph 454.

172 See Case No. COMP/M.5335 – Lufthansa/SN Airholding, paragraph 440.

b. Other provisions

- (377) As regards other provisions in the Commitments, such as the possibility for a New Entrant to participate in Frequent Flyer Programs, interlining agreements or intermodal agreements, respondents to the market test considered these provisions generally as additional, although not critical, incentives for a New Entrant. As regards interlining agreements, the Commission's investigation indicated that the lack of such a solution was in fact one of the reasons for third party carriers to exit routes between Germany and Austria.
- (378) As a further improvement introduced in the Commitments of 31 July 2009, a Monitoring Trustee, approved by the Commission, will have to be appointed before the closing of the transaction, thereby ensuring a swift implementation of the Commitments.
- (379) The Commitments of 31 July 2009 further foresee that the Monitoring Trustee will ensure that the availability of slots is made public well in advance of each IATA season. This provision will ensure and increase the future effectiveness of the Commitments. This is of particular importance for the VIE-FRA route where the slots currently held by Adria Airways will become available in two years intervals.

C. Overall assessment of the Commitments

- (380) With respect to commitments aiming at facilitating entry of new competitors, the Commission notice on remedies states they can be sufficient to remove the competition concerns raised by a proposed concentration in that they entirely remove any obstacle to effective competition, if they "actually make the entry of new competitors timely and likely". If it cannot be concluded that the lowering of the entry barriers by the proposed commitments will likely lead to the entry of new competitors in the market, however, the remedies package will normally be rejected.¹⁷³

(1) Interest expressed by competitors in entering or expanding on the Identified City Pairs

- (381) In this case, several competitors responding to the market test expressed interest in entering some or all Identified City Pairs in the IATA Summer season 2010. In particular, M.A.P. Management + Planning GmbH, a charter airline, expressed interest in entering all routes at issue with one to two frequencies. Furthermore, Croatia Airlines and Robin Hood expressed interest, under certain reservations, to enter with two frequencies on the VIE-MUC route and, respectively, on the VIE-STR and VIE-BRU routes.
- (382) It should also be noted in this context that some of the parties' most important competitors already have bases at almost all the airports concerned. More specifically, Niki has a base at

¹⁷³ It should be noted, however, that paragraph 63, footnote (4), of the Commission notice on remedies state that, in air transport mergers, a mere reduction of barriers to entry by a commitment of the parties to offer slots on specific airports may not always be sufficient to ensure the entry of new competitors on those routes where competition problems arise and to render the remedy equivalent in its effects to a divestiture.

VIE airport while its partner Air Berlin has bases at the airports of FRA, MUC and STR.¹⁷⁴ Furthermore, TUIfly, which currently does not compete with the parties on any of the Identified City Pairs and is in the process of being acquired by Air Berlin, has bases at FRA, MUC, STR and CGN airport. Moreover, SkyEurope which is currently under insolvency protection but reportedly received new capitals also has a base at VIE airport. These airlines therefore appear as plausible candidates for taking up the slot remedies at least on some of the routes.

(383) The market test of the commitments submitted on 27 July 2009 and the market investigation thus revealed some interest and indications for a likely and timely entry or expansion of competitors on the Identified City Pairs.

(2) *Evaluation in the current economic context of the air transport industry and attractiveness of the remedies package as a whole*

(384) Furthermore, in assessing the likelihood of entry on any of the Identified City Pairs in this case, the Commission must take into account the fact that the air transport industry is facing a dire crisis at the time of the market test (i.e. in July 2009). These difficulties are recognised in the recent suspension of the "use it or lose it" rule of Article 10 of Council Regulation (EEC) No 95/93 on common rules for the allocation of slots at Community airports.¹⁷⁵

(385) This greater than usual uncertainty about the evolution of the market in the coming months is also reflected in the limited interest or reservations expressed by competitors to enter and/or expand on the Identified City Pairs. Indeed, in the present exceptional economic circumstances, any such expressions of interest are more cautious than they would have been under normal circumstances.

(386) That the crisis is likely to have seriously reduced any entry or expansion plans of many airlines on any routes, including the Identified City Pairs, is also illustrated by the statements of several corporate customers responding to the market tests in phase I and II which explicitly noted that the current general economic situation is likely to constitute a significant obstacle for air carriers to enter or expand services on any of the Identified City Pairs. For instance, one corporate customer stated that the "significantly decreased total travel demand could reduce the likelihood that competitors will start or expand operations" while another corporate customer emphasised that the "current economic climate could be an obstacle to enter (or expand) on the Identified City Pairs".¹⁷⁶

(387) Against this background, the expression of interest expressed by competitors in entering the Identified City Pairs or expanding services on them mentioned above in paragraph (381)

174 See reply to question 43 of the phase I market investigation questionnaire competitors and reply to question 14 of the phase II market investigation questionnaire competitors.

175 OJ L 14, 22.1.1993, p. 1. See Regulation (EC) No 545/2009 of the European Parliament and of the Council of 18 June 2009 amending Regulation (EEC) No 95/93 on common rules for the allocation of slots at Community airports, OJ L 167, 29.6.2009, p. 24. Section 1.3.4 of the present Commitments refer to Article 10 of Regulation (EEC) No 95/93 in the context of defining situations of "Misuse" and thus make clear that any suspension of the "use it or lose it" rule under EU law also applies for slots available under the Commitment.

176 Replies to question 12 of the phase II market test.

rather illustrate that the Commitments make entry/expansion as timely and likely as possible under the present economic circumstances. Furthermore, it is clear that these exceptional circumstances are temporary in character and first signs of recovery have already been reported for several Member States as well as non-EU countries such as the United States of America, whereas the Commitments remain in place for an indefinite time period.

(388) That the Commitments are likely to result in actual entry or expansion, in particular once the current crisis is over, is further illustrated by the following considerations.

a. Attractiveness of Identified City Pairs as such

(389) All of the Identified City Pairs included in the remedies package are highly attractive in that these routes connect some of the main business centres in Europe and therefore attract a significant proportion of high yield business traffic.¹⁷⁷ This is illustrated by the fact that the VIE-FRA ([600 000 – 650 000]* total passengers, and thereof [400 000 – 450 000]* O&D passengers) and VIE-MUC ([350 000 – 400 000]* total passengers, and thereof [200 000 – 250 000]* O&D passengers) routes are highly profitable and very commercially attractive routes for both parties.¹⁷⁸

b. Improvements in comparison with previous cases in the air transport sector

(390) Moreover, in comparison with previous practice in the air transport sector¹⁷⁹ the Commitments in this case introduce some major improvements designed to ensure their effectiveness and to increase their attractiveness to competitors wishing to enter the Identified City Pairs or to expand their existing services on them.

(391) As already explained in more detail in paragraph (342), improvements include, firstly, the possibility to acquire grandfathering rights for the slots transferred under the Commitments once these slots have been used for only two IATA seasons with respect to all of the Identified City Pairs, except VIE-FRA, for which such grandfathering rights will be acquired after eight IATA seasons. This possibility to acquire grandfathering rights after a relatively short period significantly improves the incentive of the parties' competitors to enter the Identified City Pairs.

(392) Secondly, the slots must be allocated within only 20 minutes from the initial request (instead of 30 minutes, as provided for in the above mentioned previous air transport cases).

177 According to passenger surveys conducted by the parties the percentages of business travellers on these routes are as follows: up to [50-60]*% for VIE-STR, [40-50]*% for VIE-CGN, [60-70]*% for VIE-MUC and [60-70]*% for VIE-FRA. Whilst for the VIE-BRU route, the parties did not provide figures of the basis of passengers surveys, it appears that also this route is characterised by a high percentage of business traffic.

178 See reply of the parties to question 9 of request for information of 27 April 2009.

179 See for instance Case No. COMP/M.3280 – Air France/KLM and Case No. COMP/M.3940 – Lufthansa/Eurowings.

(393) Thirdly, apart from the (wave structure) restriction for Niki to re-time its existing slots on the VIE-FRA route (see paragraph (334)) the Commitments do not contain any specific limitation regarding the number of slots to be released at peak hours.

(394) Finally, the Commitments contain more convenient and efficient procedures for the allocation of slots than the procedures foreseen by remedies in the above mentioned previous air transport case.

c. Attractiveness of the remedies package in view of congestion levels at relevant airports

(395) Some of the airports for which the parties offer to make slots available under the Commitments are highly congested. This is particularly true for FRA airport, for which the market investigation has confirmed that it is one of the most congested airports in Europe. Consequently, slots at FRA airport are highly valuable, rendering the Commitments particularly attractive for the FRA-VIE route.

(396) However, even more importantly, also VIE airport is congested at peak hours (namely between 8.30 and 11.00 and between 16.00 and 20.45) (see paragraph (118)) and, under the Commitments, slots at VIE airport will have to be made available by the parties for each of the Identified City Pairs. This leaves New Entrants at this airport a choice between several different destinations and thereby increases the likelihood of entry on the Identified City Pairs

(397) The remedies comprise slots on five routes from and to VIE airport with altogether up to 19 daily frequencies (and up to 126 weekly frequencies). This considerable number of slots facilitates the establishment of a base by a new entrant and/or the enlargement of the bases of the competitors already present at VIE airport.¹⁸⁰ It has to be borne in mind that in the allocation of slots preference shall be given to those applicants that intend to operate the greatest number of Identified City Pairs. Indeed, some respondents indicated that they do not rule out the possibility of establishing a base at VIE airport.

(398) In addition, the parties propose a particularly short Utilization Period of only two consecutive IATA seasons for the acquisition of grandfathering rights for the slots to be obtained by competitors under the Commitments for all Identified City Pairs except VIE-FRA.

(399) This particularly short Utilization Period gives strong additional incentives to the parties' competitors to enter or expand on the Identified City Pairs, at the latest once the current crisis is over.

¹⁸⁰ As regards establishment of a base at VIE airport, the market investigation indicates that, depending on the business model of an air carrier, the minimum investment required might be as low as EUR 350 000.

d. Confirmation of attractiveness and effectiveness of remedies packages by the market test

(400) Finally, the large majority of respondents to the market test confirmed that, overall, the Commitments would sufficiently facilitate entry or expansion on the Identified City Pairs and solve the competition concerns raised by the proposed concentration.

(3) Conclusion on the overall assessment of the Commitments

(401) Considering all these elements together and, especially taking into account the effect of the current but temporary crisis in the air transport industry and the particular attractiveness of some elements of the remedies package, such as the short Utilization Period for the acquisition of grandfathering rights, and on the basis of the information available to the Commission, it is concluded that the Commitments are likely to lead to entry by one or several airlines on the Identified City Pairs in a timely manner and that this entry will suffice to remove the serious doubts identified on these markets.

X. CONDITIONS AND OBLIGATIONS

(402) Pursuant to the second subparagraph of Article 8(2) of the Merger Regulation, the Commission may attach to its Decision conditions and obligations intended to ensure that the undertakings concerned comply with the commitments they have entered into vis-à-vis the Commission with a view to rendering the concentration compatible with the common market.

(403) The fulfilment of the measures that give rise to the structural change of the market is a condition, whereas the implementing steps which are necessary to achieve this result are generally obligations on the parties. Where a condition is not fulfilled, the Commission's Decision declaring the concentration compatible with the common market no longer stands. Where the undertakings concerned commit a breach of an obligation, the Commission may revoke the clearance Decision in accordance with Article 8(6) of the Merger Regulation. The undertakings concerned may also be subject to fines and periodic penalty payments under Article 14(2) and Article 15(1) of the Merger Regulation.

(404) In accordance with the distinction between conditions and obligations, this Decision should be made conditional on full compliance by the notifying party with Sections 1.1.1, 1.1.3 (iii), 1.2.2, 1.2.5, 1.2.8, 1.3.2, 2, 4.1, 5.1, 6.1 and 7.1 of the Commitments submitted by the notifying party on 31 July 2009. All other Sections of the Commitments should be obligations within the meaning of Article 8(2) of the Merger Regulation. The full text of the Commitments is set out in the Annex to this Decision and constitutes an integral part thereof.

XI. CONCLUSION

- (405) It is accordingly concluded that the Commitments as set out in the Annex to this Decision modify the notified concentration to such an extent that the serious doubts of the Commission as to the compatibility of that concentration with the common market are removed. The concentration should, therefore, be declared compatible with the common market pursuant to Article 8(2) of the Merger Regulation and with the EEA Agreement pursuant to Article 57 thereof, subject to compliance with the Commitments set out in the Annex which is an integral part of this Decision.
- (406) This conclusion holds true irrespective of the rescue aid and the restructuring aid mentioned in section VII.G due to the fact that those funds primarily serve the purpose of ensuring the survival of OS and due to their low amount as compared to the overall financial needs of OS and the overall financial strength of LH.

HAS ADOPTED THIS DECISION:

Article 1

The notified concentration whereby Deutsche Lufthansa AG acquires control of Austrian Airlines within the meaning of Article 3(1)(b) of Regulation (EC) No 139/2004 is hereby declared compatible with the common market and the EEA Agreement.

Article 2

Article 1 is subject to compliance with the conditions set out in Sections 1.1.1, 1.1.3 (iii), 1.2.2, 1.2.5, 1.2.8, 1.3.2, 2, 4.1, 5.1, 6.1 and 7.1 of the Annex.

Article 3

Deutsche Lufthansa AG shall comply with the obligations set out in the sections of the Annex not referred to in Article 2.

Article 4

This decision is addressed to:

Deutsche Lufthansa AG
Von-Gablenz-Strasse, 2-6
D-50679 Köln

PHASE II COMMITMENTS PACKAGE

CASE COMP/M.5440 - Lufthansa /Austrian Airlines

Pursuant to Article 8(2) of Council Regulation (EC) 139/2004 (“Merger Regulation”), Deutsche Lufthansa AG (“Lufthansa”) submits the commitments specified below (the “Commitments”) in order to enable the European Commission (“Commission”) to declare the proposed concentration between Lufthansa and Austrian Airlines (“Concentration”) compatible with the common market by means of a decision pursuant to Article 8(2) of the Merger Regulation (“Decision”).

These Commitments shall take effect upon receipt of the Commission’s Decision declaring the Concentration compatible with the common market and will be binding on Lufthansa, its subsidiaries, successors and assigns. These Commitments are offered exclusively in the context of the notified concentration between Lufthansa and Austrian Airlines and are without prejudice to the position of Lufthansa and/or its alliance partners in other cases examined by the European Commission.

This text shall be interpreted in the light of the Decision to which the Commitments are attached as conditions and obligations, and in the general framework of Community law, in particular in the light of the Merger Regulation, and by reference to the Commission Notice on remedies.

0 DEFINITIONS

Blocked Space Agreement

An agreement on the purchase of reserved seating capacity by one airline (the marketing airline) on flights operated by another airline (the operating airline).

Brussels Airport

Means Brussels Zaventem Airport (BRU).

Codeshare

Means an enhanced form of interlining that includes one airline (the marketing airline) marketing services on flights operated by the other airline (the operating airline) under its own name and under its own designator code, regardless of whether it is construed in form of a free-flow or blocked space agreement or in other form.

Competitive Air Service

A non-stop scheduled passenger air service that is operated on one or more of the Identified City Pairs.

Consummation of the Concentration

The date on which Lufthansa, through Gomele Beteiligungsverwaltungs GmbH and Sobire Beteiligungsverwaltungs GmbH, acquires at least 75% of the share capital in Austrian Airlines as provided for in the Amendment and Waiver Agreement dated 5 December 2008.

Effective Date

The date of the Decision.

Frequency

Means a roundtrip on an Identified City Pair.

FFP (Frequent Flyer Program)

A program offered by airlines to reward customer loyalty under which airline customers enrolled in the program accrue points for travel on that airline that can be redeemed for free air travel and other products or services, as well as allowing passengers to have increased benefits, such as airport lounge access, or priority bookings.

IATA Scheduling Period or IATA Season

The IATA Summer Scheduling Period (also known as IATA Summer Season) starts on the 4th Sunday in March and ends on the 4th Saturday in October. The IATA Winter Scheduling Period (also known as IATA Winter Season) starts on the 4th Sunday in October and ends on the 4th Saturday in March.

Identified City Pairs

Vienna-Frankfurt, Vienna-Munich, Vienna-Cologne/Bonn, Vienna-Stuttgart, Vienna-Brussels..

Indemnified Party

Has the meaning given to it in Section 8.2.6.

Interline Agreement

An agreement between two or more airlines under which the contracting airlines accept each other's travel documents (tickets).

Intermodal Partner

Has the meaning given to it in Section 6.1.

Lufthansa

Deutsche Lufthansa AG and Austrian Airlines AG, and companies and/or affiliated businesses controlled by these entities after the Consummation of the Concentration.

Misuse

This term will have the meaning provided under Section 1.3.4.

MITA

Multilateral Interline Traffic Agreements Manual published by the International Air Transport Association (IATA).

Monitoring Trustee

Means an individual or institution, independent from Lufthansa and Austrian Airlines, who is approved by the Commission and appointed by Lufthansa and who has the duty to monitor Lufthansa's compliance with the conditions and obligations attached to the Decision as more fully described in Section 8.

New Air Service Provider

Any airline or airlines that are each members of the same alliance (other than the Parties including all airlines controlling it/them or controlled by it/them), that individually, or collectively by Codeshare, provide(s) a new or additional Competitive Air Service.

Parties

Lufthansa, Austrian Airlines and any undertakings controlled by either Lufthansa or Austrian Airlines.

Prospective New Entrant

Any airline or airlines that are each members of the same alliance (other than the Parties, including all airlines controlling either of them or controlled by either of them), able to offer a new or additional Competitive Air Service individually or collectively by Codeshare and needing a slot or slots to be made available by Lufthansa in accordance with the Commitments to operate a Competitive Air Service.

Published Fare

Refers to applicable IATA fares, carrier fares that are distributed to CRS via the public tariff data base of ATPCO (Airline Tariff's Publishing Corporation), and fares marketed on the Internet where such fares are available to the general public, excluding network-wide fuel, passenger or service surcharges.

Review Section

Has the meaning given to it in Section 11.

Slot

Shall mean the arrival and departure at a scheduled time available or allocated to an aircraft movement on a specific date at the airport of origin and destination.

Slot Handback Deadline

15 January for the IATA Summer Scheduling Period and 15 August for the IATA Winter Scheduling Period.

Slot Transfer Agreement

Has the meaning given to it in Section 1.2.6.

Slot Transfer Procedure

Has the meaning given to it in Section 1.2.1.

Standard Slot Allocation Procedure

Has the meaning given to it in Section 1.2.1.

1 SLOTS

1.1 SLOTS FOR CERTAIN IDENTIFIED CITY PAIRS

1.1.1 The Parties undertake to make available Slots at Vienna and/or Frankfurt and/or Munich and/or Cologne/Bonn and/or Stuttgart and/or Brussels to allow one or more Prospective New Entrant(s) to operate a new or additional Competitive Air Service on the following Identified City Pairs. The Parties shall be obliged to make available to Prospective New Entrants the number of Slots needed to support in aggregate:

- **Vienna-Frankfurt:** up to five (5) frequencies per day;
- **Vienna-Stuttgart:** up to three (3) frequencies per day;
- **Vienna-Cologne/Bonn:** up to three (3) frequencies per day, but not more than 18 frequencies per week;
- **Vienna-Brussels:** up to four (4) frequencies per day, but not more than 24 frequencies per week; and
- **Vienna-Munich** up to four (4) frequencies per day.

1.1.2 The number of Slots the Parties to be made available under Section 1.1.1 shall be reduced by the number of Slots already transferred to a Prospective New Entrant except for Slots that have been handed back to the Parties pursuant to Section 1.2.8 or Section 1.3.4. Subject to the provisions in Sections 1.1.3 and 1.1.4 below, Frequencies of a Competitive Air Service already operated by an airline independent of and unconnected to the Parties on an Identified City Pair shall be counted against the number of Slots to be made available by the Parties to that airline under Section 1.1.1 for this Identified City Pair.

1.1.3 Notwithstanding the provisions of 1.1.2, with respect to the Vienna-Frankfurt City Pair, on which Niki Luftfahrtgesellschaft mbH (“Niki”) currently operates a Competitive Air Service with two (2) Frequencies for which it has obtained from Lufthansa two (2) Slots at Frankfurt, and Adria Airways currently operates a Competitive Air Service with three (3) Frequencies for which it has obtained from Lufthansa three (3) Slots at Frankfurt, the following shall apply:

- (i) The two (2) Frequencies currently operated by Niki based on slots leased from Lufthansa (three (3) Frequencies to the extent that Niki obtains a third slot from Lufthansa as from the IATA Winter Seasons 2009/2010), shall be counted against the number of Slots to be made available by the Parties under Section 1.1.1 for the Vienna-Frankfurt City Pair. For the avoidance of doubt, if Niki were to exit from one or more of these frequencies in advance of acquiring grandfathering rights, such frequencies will be made available in accordance with section 1.1.1.

- (ii) In case no Non-Star Alliance Applicant (as defined in Section 3.5) requests Slots for the Vienna-Frankfurt City Pair for the IATA summer season 2010 or the first season for which the procedures for implementation of the present commitments would be in place, whichever is the later, one (1) Frequency operated by Adria Airways shall be counted against the number of Slots to be made available by the Parties under Section 1.1.1 for the Vienna-Frankfurt City Pair until the end of three subsequent IATA seasons, and for every subsequent period of 2 years until such time as a non-Star Alliance Applicant requests such slot. For the avoidance of doubt, this exceptional mechanism shall cease to apply should Adria Airways at any stage cease to operate frequencies on the Vienna-Frankfurt City Pair.
- (iii) Lufthansa undertakes to amend its existing agreements with Niki to reflect the provisions of these Commitments. For the IATA summer season 2010 and IATA winter season 2010/2011, Niki may request to exchange its existing Slots for Slots at different times pursuant to Section 1.2.1 of these Commitments, for these and subsequent IATA seasons, provided that Lufthansa shall not be obliged to transfer to Niki more than one Slot at Frankfurt during each of the time periods defined in the table below. If Niki has already two Slots in one time period, Lufthansa shall be obliged to grant any request by Niki to exchange up to two Slots in that time period, but shall be entitled to ensure that the relevant Slots are at least 105 minutes apart. For the avoidance of doubt, Niki may retain any or all of its existing Slots for which it would not seek an exchange under this paragraph.

Arrival	Departure
05:35 - 08:00	06:30 - 08:15
08:05 - 10:20	08:20 - 11:35
10:25 - 14:00	11:40 - 15:05
14:05 - 15:30	15:10 - 16:15
15:35 - 17:50	16:20 - 19:45
17:55 - 21:50	19:50 - 22:25

The Utilization Period required for the acquisition of grandfathering rights for the two (2) Frequencies currently operated by Niki based on slots leased from Lufthansa (three (3) Frequencies to the extent that Niki obtains a third slot from Lufthansa as from the IATA Winter Season 2009/2010) shall begin with the start of the IATA Winter Season 2009/2010, irrespective of whether Niki exchanges such Slots for Slots at different times in accordance with this paragraph. For the avoidance of doubt any Slot granted by Lufthansa under the present Commitments to Niki in a different time period, as defined in the table above, from the time period for which Niki had requested the Slot shall be deemed to be granted in that latter time period for the purposes of the present paragraph (iii).

- (iv) Lufthansa undertakes to amend its existing agreements with Adria Airways with respect to one (1) slot to reflect the provisions of these Commitments, provided however that Adria Airways shall not acquire grandfathering rights.

1.1.4 Notwithstanding the provisions of 1.1.2, with respect to the Vienna-Munich City Pair, on which Niki Luftfahrtgesellschaft mbH (“Niki”) currently operates a Competitive Air Service with three (3) Frequencies, Niki may request, to exchange these existing Slots for

Slots at different times pursuant to Section 1.2.1 of these Commitments. Niki's Frequencies shall be counted against the number of Slots to be made available by the Parties under Section 1.1.1 for the Vienna-Munich City Pair. For the avoidance of doubt, if Niki were to exit from one or more of the frequencies obtained under these Commitments in advance of acquiring grandfathering rights and/or from one or more of the frequencies currently operated, a corresponding number of frequencies will be made available by Lufthansa in accordance with section 1.1.1.

1.1.5 To the extent that the Parties make available Slots to a Prospective New Entrant for the operation of a new or additional Competitive Air Service on the Identified City Pairs Vienna-Stuttgart and/or Vienna-Cologne/Bonn pursuant to Section 2.1.1 of Lufthansa's commitments in case COMP/M.3940 – *Lufthansa/Eurowings*, these Slots shall be counted against the number of Slots to be made available pursuant to this Section 1.1.1. Conversely, to the extent that the Parties make available Slots to a Prospective New Entrant for the operation of a new or additional Competitive Air Service on the Identified City Pair Vienna-Stuttgart and/or Vienna-Cologne/Bonn pursuant to this Section 1.1.1, these Slots shall be counted against the number of Slots to be made available pursuant to Section 2.1.1 of Lufthansa's commitments in case COMP/M.3940. For the avoidance of doubt, a Prospective New Entrant on these Identified City Pairs shall have the choice of whether to avail itself of the commitments in Case COMP/M.3940 or the present Commitments.

1.1.6 Lufthansa will inform the Monitoring Trustee and the Commission in accordance with Section 8 of the announced commencement by a carrier of a new or additional Competitive Air Service on an Identified City Pair that does not use Slots made available by the Parties as soon as possible following the announcement of that service, and of the amendments to existing agreements in accordance with Section 1.1.3.

1.2 CONDITIONS PERTAINING TO SLOTS

1.2.1 The Prospective New Entrant shall comply with the following procedure to obtain slots from the Parties ("***Slot Transfer Procedure***").

The Prospective New Entrant wishing to commence/increase a new additional Competitive Air Service on one or more of the Identified City Pairs shall notify in writing its request for Slots to (i) the slot coordinator, through the normal slot allocation procedure ("***the Standard Slot Allocation Procedure***"); and (ii) the Monitoring Trustee, within the period provided for in Clause 3.1.

The Prospective New Entrant shall be eligible to receive slots pursuant to these Commitments only if it can demonstrate that all reasonable efforts to obtain slots for the Identified City Pair(s) through the Standard Slot Allocation Procedure before the beginning of the relevant IATA traffic season have failed, including the allocation of Slots by the coordinator from the waitlist following the Slot Handback Date. The Prospective New Entrant shall request slots for use during a full IATA Season unless it can demonstrate a compelling business need to start its services during the Season.

The Prospective New Entrant will be deemed not to have exhausted all reasonable efforts to obtain slots, if:

- (i) slots were obtained through the Standard Slot Allocation Procedure within twenty (20) minutes of the times requested, but such slots have not been accepted by the Prospective New Entrant; and/or
 - (ii) slots were obtained through the Standard Slot Allocation Procedure more than twenty (20) minutes from the times requested and the Prospective New Entrant did not give the Parties the opportunity to exchange those slots for slots within +/- twenty (20) minutes of the times requested.
- 1.2.2** The slots released by the Parties shall be within +/- twenty (20) minutes of the time requested by the Prospective New Entrant, if the Parties have slots available within this time-window. In the event that the Parties do not have slots available within this time-window, they shall offer to release the slots closest in time to the Prospective New Entrant's request. Arrival and departure slots shall be such as to allow for reasonable aircraft rotation taking into account the Prospective New Entrant's business model. The Parties do not have to offer slots, however, if the slots that the Prospective New Entrant can obtain through the Standard Slot Allocation Procedure are closer in time to the Prospective New Entrant's request than the slots that the Parties have available.
- 1.2.3** Any slot transferred on an indefinite basis in accordance with the Slot Transfer Procedure under Section 1.3 shall reduce the maximum number of slots to be transferred in accordance with the Commitments.
- 1.2.4** To ensure that the slots released by the Parties are used in a manner consistent with these conditions, the Prospective New Entrant should inform the Monitoring Trustee in accordance with Section 3.5.
- 1.2.5** Slots made available by the Parties under these Commitments shall be offered without any compensation.
- 1.2.6** The Parties shall enter into a slot transfer agreement with the Prospective New Entrant (the "*Slot Transfer Agreement*"). Such an agreement shall be subject to review by the Monitoring Trustee and approval by the Commission and shall provide for fast-track dispute resolution according to Section 9. The agreement may (i) contain prohibitions on the Prospective New Entrant transferring any slots released by the Parties to a third party, swapping such slots for other slots with a third party, making available such slots in any way to any third party for the use of that third party, or releasing, surrendering, giving up or otherwise disposing of such slots; and (ii) provide for reasonable financial compensation to the Parties in case of Misuse as defined in Sections 1.3.4 and 1.3.5. The duration of the Slot Transfer Agreement shall be the Utilization Period, as defined in 1.3.1 below, except if the Prospective New Entrant is a member of the Star Alliance. If the Prospective New Entrant is a member of the Star Alliance, the agreement shall include the obligations listed in 1.3.6 and, if appropriate, specific conditions imposed on the Prospective New Entrant by the Commission according to Section 3.3. c), and the

Commission's approval of the agreement shall be conditional on the Prospective New Entrant committing to comply with these obligations and conditions.

- 1.2.7** The slot transfer agreement shall provide that the Prospective New Entrant will be able to terminate the slot transfer agreement at the end of each IATA season without penalty, provided the Prospective New Entrant notifies the termination of the agreement to the Parties in writing before the Slot Handback Deadline for the relevant IATA season.
- 1.2.8** Upon termination of the agreement, the slots will be handed back to the Parties and will be available for a new entrant under Section 1.1.1, unless the Prospective New Entrant has acquired Grandfathering rights according to Section 1.3.

1.3 GRANDFATHERING OF SLOTS

- 1.3.1** As a general rule, the slots obtained by the Prospective New Entrant from the Parties as a result of the Slot Transfer Procedure shall be used only to provide a Competitive Air Service on the Identified City Pairs for which the Prospective New Entrant has requested them from the Parties through the Slot Transfer Procedure. These slots can not be used on another city pair unless
- the Prospective New Entrant has operated the Identified City Pair for which these slots have been transferred for a number of full consecutive IATA Seasons ("*Utilization Period*") and
 - the Prospective New Entrant is not a member of the Star Alliance.

The Utilization Periods for the Identified City Pairs Vienna-Frankfurt shall be 8 (eight) consecutive IATA Seasons, and 2 (two) consecutive IATA seasons for all other Identified City Pairs.

- 1.3.2** The slot transfer will become definitive and the Prospective New Entrant will be deemed to have grandfathering rights for the slots once appropriate use of these slots has been made on the Identified City Pair during the Utilization Period. In this regard, once the Utilization Period has elapsed, the Prospective New Entrant will be entitled to use the slot(s) obtained on the basis of these Commitments exclusively for intra-European City Pair operated by the Prospective New Entrant, or operated by one of the Prospective New Entrant's alliance partners and marketed by the Prospective New Entrant on a code-share basis ("*Grandfathering*").
- 1.3.3** Grandfathering is subject to the approval of the Commission, advised by the Monitoring Trustee, in accordance with Section 3.3. The Commission's approval shall be conditional on the Prospective New Entrant committing that if it ceases to use the Slots in question for purposes described in Section 1.3.2, it will return those Slots to the slot coordinator.

1.3.4 During Utilization Period, the Prospective New Entrant shall not be entitled to transfer, assign, sell, swap or charge in breach of these Commitments any Slot transferred by the Parties in the Slot Transfer Procedure. During the Utilization Period, a situation of Misuse shall be deemed to arise where a Prospective New Entrant that has obtained slots released by the Parties decides: (i) not to commence services on a Identified City Pair(s); (ii) to operate fewer daily Frequencies on the Identified City Pair(s) or to cease operating on the Identified City Pair(s) during such period; (iii) to transfer, assign, swap or sell in breach of these Commitments any Slot transferred by the Parties in the Slot Transfer Procedure; (iv) not to use the slots for the Identified City Pair(s); and (v) not to use the slots properly. The Prospective New Entrant does not use the slots properly, if (a) it loses the slots as a consequence of the principle of “*use it or lose it*” in Article 10 of Regulation (EEC) No. 95/93 or (b) it misuses the slot as described and interpreted in Art. 14 (4) of the Slot Regulation 793/2004.

1.3.5 During the Utilization Period, the Prospective New Entrant who has obtained slots under the Slot Transfer Procedure and has been found to or is anticipated to be found in a situation of Misuse as defined in Section 1.3.4 shall immediately inform the Monitoring Trustee and Lufthansa and hand back the Slots. In cases (i) and (ii) identified in Section 1.3.4, the Parties shall then use their best efforts to redeploy the slots in order to safeguard the historic precedents. If despite their best efforts, the Parties are not able to retain the historic precedents for these slots, or in case of a Misuse as defined in (iii), (iv), and (v)(b) of Section 1.3.4, the Prospective New Entrant shall provide reasonable compensation to the Parties as provided for in the Slot Transfer Agreement.

1.3.6 If the Prospective New Entrant is a member of the Star Alliance at the time of the signature of the Slot Transfer Agreement, or becomes a member of the Star Alliance between the signature of the Slot Transfer Agreement and the end of the Utilization Period (Star Alliance New Entrant), the Prospective New Entrant will not acquire grandfathering rights of the slots released.

A Star Alliance New Entrant shall not be entitled to transfer, assign, swap or sell any slot transferred by the Parties. All provisions of Sections 1.3.4 and 1.3.5 foreseen for the Utilization Period apply to a Star Alliance New Entrant without any limitation in time.

Furthermore, the Star Alliance New Entrant shall not enter into a code share agreement with the parties or any other airline that is a member of the Star Alliance with respect to the Identified City Pairs on which it operates a Competitive Air Service, and more generally shall not operate a Competitive Air Service collectively with the Parties or any other airline that is a member of the Star Alliance.

2 DURATION OF THE SLOT TRANSFER

The Parties’ obligations to transfer slots are unlimited in duration and may be invoked at any time by a Prospective New Entrant, subject to the limitations set out in Sections 1 and 11.

3 SELECTION PROCEDURE, ROLE OF THE MONITORING TRUSTEE AND APPROVAL OF THE COMMISSION

- 3.1** Before the deadline for the submission of slot applications to slot coordinators (i.e. currently 35 days before the IATA Scheduling Conference)(the “*Final Slot Request Date*”), any airline wishing to obtain Slots from the Parties pursuant to the Transfer Procedure shall send a slot request to (i) the slot coordinator; and (ii) the Monitoring Trustee.
- 3.2** At latest three (3) weeks before the IATA Scheduling Conference of the relevant season, the Monitoring Trustee forwards the slot requests to Lufthansa and asks, if necessary, which slots the Parties would release within +/- twenty (20) minutes of the time a Prospective New Entrant requested. Lufthansa’s proposal shall refer to IATA’s Slot Preliminary Allocation List (SAL). Lufthansa will respond to the Monitoring Trustee within two (2) weeks upon the Monitoring Trustee’s request.
- 3.3** Between the Final Slot Request Date and the beginning of the IATA Scheduling Conference the Commission, advised by the Monitoring Trustee:
- (a) assesses whether each applicant would qualify as a Prospective New Entrant and whether the service to be provided by the Applicant qualifies as a Competitive Air Service;
 - (b) if there is more than one applicant, ranks the applicants by order of preference;
 - (c) if the Prospective New Entrant is a member of the Star Alliance, or is anticipated to become a Member of the Star Alliance, assesses whether specific conditions should be imposed on the Prospective New Entrant; and
- 3.4** In its assessment according to Section 3.3 (a), the Commission shall decide after considering the advice of the Monitoring Trustee whether it considers the applicant to be a Prospective New Entrant pursuant to the following criteria:
- the Prospective New Entrant is independent of and unconnected to the Parties;
 - the Prospective New Entrant is a viable existing or potential competitor, with the ability, resources and commitment to operate the Identified City Pair in the long term as a viable and active competitive force.
- 3.5** In its assessment according to Section 3.3. (b), the Commission shall decide, after considering the advice of the Monitoring Trustee, how to rank the applicants by order of preference using notably the following criteria:
- Preference shall be given to applicants that are not members of the Star Alliance or anticipated to become members of the Star Alliance (Non Star Alliance Applicants) over applicants that are members of the Star Alliance or anticipated to become members of the Star Alliance (Star Alliance Applicants), regardless of the

number of Identified City Pairs or Frequencies the Star Alliance Applicant(s) is/are proposing to operate.

- If there is more than one Non Star Alliance Applicant, preference shall be given to the Non Star Alliance Applicant that intends to operate the greatest numbers of Identified City Pairs.
 - If there is more than one Star Alliance applicant, preference shall be given to the Star Alliance Applicant that intends to operate the greatest number of Identified City Pairs.
- 3.6** In its assessment according to Section 3.3 (c), the Commission shall decide, after considering the advice of the Monitoring Trustee, whether specific conditions should be imposed on a Star Alliance Applicant in order to guarantee the independence of the Star Alliance Applicant from the Parties.
- 3.7** To assist the Monitoring Trustee in the preparation of his advice and/or the Commission in taking its decision, the Monitoring Trustee and/or the Commission shall request the Prospective New Entrant to provide to the Monitoring Trustee and/or the Commission with a detailed business plan. This plan shall contain a general presentation of the company including its history, its legal status, the list and a description of its shareholders and the two most recent yearly audited financial reports. The plan shall provide information on the plans that the company has in terms of development of its network, fleet etc, and detailed information on its plans for the Identified City Pairs on which it wants to operate. The company should specify in detail planned operations (size of aircraft, number of frequencies operated, planned time-schedule of the flights) and expected financial results (expected traffic, revenues, profits) on the Identified City Pairs on which it wants to operate during the Utilization Period for the respective Identified City Pair. The Monitoring Trustee and/or the Commission may also request a copy of all co-operation agreements the Prospective New Entrant may have with other airlines. Business secrets and confidential information will be kept confidential by the Commission and the Monitoring Trustee and will not become accessible to other undertakings or to the public.
- 3.8** Upon receiving the SAL messages from the slot coordinator, and in advance of the beginning of the IATA Scheduling Conference, the Monitoring Trustee informs each applicant not having received slots within the time-window of +/-twenty (20) minutes as indicated through the SAL and the slot coordinator:
- (i) whether it qualifies for the Slot Commitment;
 - (ii) whether it is:
 - a) The only applicant or the preferred applicant; or
 - b) Not the preferred applicant

(iii) whether specific conditions are imposed by the Commission under Section 3.3
(c)

(iv) the exact Slot(s) that the Parties would release through the Slot Transfer Procedure.

In any case, the applicant shall go to the IATA Scheduling Conference and try to improve its slots.

3.9 At the end of the IATA Scheduling Conference, it will be clear, also for the Monitoring Trustee, for instance through the *European Union Airport Coordinators Association* (EUACA) database, whether each Prospective New Entrant will have received slots within the window of +/- twenty (20) minutes through the Standard Slots Allocation Procedure.

3.10 Within two (2) weeks of the end of the IATA Scheduling Conference, the preferred applicant informs the Monitoring Trustee and Lufthansa whether it will commit to operate the slots offered eventually by the Parties, in case the Standard Slot Allocation Procedure does not provide for them. If not, the Monitoring Trustee offers the slots to the next applicant (if any) by order of preference.

3.11 Within one (1) week of the confirmation that the applicant will operate the slots, the Parties offer the dedicated slots for transfer to the preferred applicant. The Slot Transfer Agreement shall be signed and the slot transfer performed within three weeks after the Slot Handback Deadline, and the slot coordinator is informed of the transfer in order to get the required confirmation.

4 INTERLINING AGREEMENTS

4.1 At the request of a New Air Service Provider, the Parties shall enter into an interline agreement concerning any Identified City Pair operated by the New Air Service Provider.

4.2 Any such interline agreement shall be subject to the following restrictions:

- it shall apply to the business and economy class only;
- it shall provide for interlining on the basis of the Parties' published one-way fares when a one-way ticket is issued or half of the Parties' published round-trip fares when a round-trip ticket is issued;
- it shall be limited to true origin and destination traffic on the Identified City Pair operated by the New Air Service Provider;
- it shall be subject to the MITA rules and/or normal commercial conditions;

- it shall include the possibility for the New Air Service Provider, or travel agents, to offer a return trip comprising services provided one-way by the Parties and one-way by the New Air Service Provider.
- 4.3** Subject to seat availability in the relevant fare category, the Parties shall carry a passenger holding a coupon issued by a New Air Service Provider for travel on an Identified City Pair. However, to avoid abuse, the Parties may require that the New Air Service Provider or the passenger, where appropriate, pay the (positive) difference between the fare charged by the Parties and the fare charged by the New Air Service Provider. In cases where the New Air Service Provider's fare is lower than the value of the coupon issued by it, the Parties may endorse its coupon only up to the value of the fare charged by the New Air Service Provider. A New Air Service Provider shall enjoy the same protection in cases where the Parties' fare is lower than the value of the coupon issued by it.
- 4.4** All interline agreements entered into pursuant to this Section 4 for a particular Identified City Pair shall lapse automatically in the event that the New Air Service Provider ceases to operate that City Pair.

5 SPECIAL PRORATE AND CODE SHARE AGREEMENTS

- 5.1** At the request of a Prospective New Entrant, the Parties shall enter into a special prorate agreement with the Prospective New Entrant for traffic with a true origin and destination in either Austria and/or Germany or Austria and/or Belgium, provided part of the journey involves the Vienna-Frankfurt, Vienna-Munich, Vienna-Cologne, Vienna-Stuttgart, or Vienna-Brussels routes. The conditions for a special prorate agreement shall be on terms such that the New Air Service Provider shall have equal treatment with Lufthansa's Star Alliance partners on the same Identified City Pair. Financial conditions will be reasonable and in particular reflect the average conditions agreed upon with Lufthansa's alliance partners. The conclusion of the special prorate agreement is subject to the approval of the Commission, advised by the Monitoring Trustee. The Commission will in particular assess whether the financial conditions of the special prorate agreement are reasonable.

6 COMMITMENT TO FACILITATE INTERMODAL SERVICES

- 6.1** At the request of a railway or other surface transport company operating between Austria, Belgium, and/or Germany (an Intermodal Partner), the Parties shall enter into an intermodal agreement whereby they provide passenger air transport on their services on any of the Identified City Pairs as part of an itinerary that includes surface transportation by the Intermodal Partner.
- 6.2** Any intermodal agreement entered into pursuant to this Section 6 shall be based on the MITA principles (including the Intermodal Interline Traffic Agreement - Passenger and IATA Recommended Practice 1780e) and normal commercial conditions. The Parties shall accept full pro-rating according to the terms applied by MITA members, including on routes where only rail services are provided. No restrictions shall apply to fare

combinations between carriers that are IATA intermodal MITA members and the most restrictive conditions rule shall apply only for the applicable segment and its carrier. The Parties and the Intermodal Partner may waive minimum stay requirements on any fare and any City Pair they operate. Such decisions are respected and published reciprocally. Where the Intermodal Partner requires notification of a sector mileage, a location identifier or an add-on fare, the Parties shall make such a request to IATA under normal IATA procedures.

- 6.3** At the request of a potential Intermodal Partner, the Parties shall make efforts in good faith to reach an agreement on conditions comparable to those granted to other Intermodal Partners, provided that the necessary requirements are met especially with regard to safety, quality of service, insurance coverage and liability limits. The conditions of such an agreement shall override the general obligations arising pursuant to this Section 6.

7 FREQUENT FLYER PROGRAM

- 7.1** At the request of a New Air Service Provider that does not participate in Lufthansa's frequent flyer program ("Miles&More"), Lufthansa shall allow it to be hosted in Miles&More for the Identified City Pairs operated by the New Air Service Provider. The agreement with the New Air Service Provider shall be on terms such that the New Air Service Provider shall have equal treatment with Lufthansa's alliance partners. Financial conditions will reflect the average conditions agreed upon with Lufthansa's alliance partners.
- 7.2** Any agreement relating to a particular Identified City Pair and entered into pursuant to this Section 7 shall lapse automatically in the event that the New Air Service Provider ceases to operate that City Pair.

8 MONITORING TRUSTEE

8.1 APPOINTMENT OF MONITORING TRUSTEE

- 8.1.1** A Monitoring Trustee shall be appointed in accordance with the procedure described in Section 8.1.2. The Monitoring Trustee must be familiar with the airline industry and have the experience, competence and independence necessary for this appointment. The Monitoring Trustee will have had no direct or indirect employment, consultancy or other relationship with Lufthansa or Austrian Airlines during the past two years and will have no such relationship with Lufthansa for the three years following the completion of its mandate.
- 8.1.2** The Parties shall ensure that the Monitoring Trustee's remuneration shall be sufficient to guarantee the effective and independent compliance of its mandate.

Within one (1) week of the Effective Date, Lufthansa, in agreement with Austrian Airlines, shall submit a list of one or more persons whom Lufthansa proposes to appoint as the Monitoring Trustee to the Commission for approval.

The proposal shall contain sufficient information for the Commission to verify that the proposed Monitoring Trustee fulfils the requirements set out in Section 8.1.1 and shall include:

- (i) the full terms of the proposed mandate, which shall include all provisions necessary to enable the Monitoring Trustee to fulfil its duties under these Commitments;
- (ii) the outline of a work plan which describes how the Monitoring Trustee intends to carry out its assigned tasks.

The Commission shall have the discretion to approve or reject the proposed Monitoring Trustee and to approve the proposed mandate subject to any modifications it deems necessary for the Monitoring Trustee to fulfil its obligations. If only one name is approved, Lufthansa shall appoint or cause to be appointed the individual or institution concerned as Monitoring Trustee. If more than one name is approved, Lufthansa shall be free to choose the Trustee to be appointed from among the names approved. The Monitoring Trustee shall be appointed within one (1) week of the Commission's approval, in accordance with the mandate approved by the Commission. Lufthansa commits not to close the notified transaction before the appointment of the Monitoring Trustee.

If all the proposed Monitoring Trustees are rejected, Lufthansa shall submit the names of at least two more individuals or institutions within one (1) week of being informed of the rejection, in accordance with the requirements and the procedure set out in Section 8.1.1.

If all further proposed Monitoring Trustees are rejected by the Commission, the Commission shall nominate a Monitoring Trustee, whom Lufthansa shall appoint, or cause to be appointed, in accordance with a trustee mandate approved by the Commission.

8.2 MONITORING TRUSTEE'S MANDATE

8.2.1 The Monitoring Trustee's mandate shall include, in particular, the following responsibilities:

- (i) to monitor the satisfactory discharge by the Parties of the obligations entered into in these Commitments in so far as they fall within the scope of these Commitments;
- (ii) to propose to the Parties such measures as the monitoring Trustee considers necessary to ensure the Parties' compliance with the conditions and obligations attached to the Decision;

- (iii) to advise and make a written recommendation to the Commission as to the suitability of the Slot Transfer Agreement and any Prospective New Entrant submitted for approval to the Commission under Section 1 and 3;
- (iv) to provide written reports to the Commission on the progress of the discharge of its mandate, identifying any respects in which the Parties have failed to comply with these Commitments and in which the Monitoring Trustee has been unable to discharge its mandate;
- (v) to mediate any disagreements relating to these Commitments;; if mediation is agreed to by the other party or parties to the agreement in question, and submit a report upon the outcome of the mediation to the Commission; and
- (vi) at any time, to provide to the Commission, at its request, a written or oral report on matters falling within the scope of these Commitments;
- (vii) to review and report on the amendments to the agreements referred to in Section 1.1.3.
- (viii) to grant adequate publicity in trade journals and by any other appropriate means sufficiently in advance of the beginning of the slot allocation procedure for each IATA Season to those remedies under the present Commitments which have not yet been taken up by competitors or which may become available.

8.2.2 The Parties shall receive simultaneously a non-confidential version of any written recommendation made by the Monitoring Trustee to the Commission (as provided for in Section 8.2.1(iii)).

8.2.3 The reports provided for in Section 8.2.1(iii) to (vii) shall be prepared in English. The reports provided for in Section 8.2.1(iv) shall be sent by the Monitoring Trustee to the Commission within ten (10) working days from the end of every IATA season following the Monitoring Trustee's appointment or at such other time(s) as the Commission may specify, and shall cover developments in the immediately preceding IATA season. The Parties shall receive simultaneously a non-confidential copy of each Monitoring Trustee report.

8.2.4 The Parties shall provide the Monitoring Trustee with such assistance and information, including copies of all relevant documents, as the Monitoring Trustee may reasonably require in carrying out its mandate and shall pay reasonable remuneration for its services.

8.2.5 The Monitoring Trustee shall have full and complete access to any of the Parties' books, records, documents, management or other personnel facilities, sites, technical information necessary for fulfilling its duties.

8.2.6 The Parties shall indemnify the Monitoring Trustee (and, where appropriate, its employees and agents) (each an Indemnified Party) and hold each Indemnified Party

harmless, and hereby agrees that an Indemnified Party shall have no liability to the Parties for any liabilities arising out of the performance of the Monitoring Trustee's duties under the Commitments, except to the extent that such liabilities result from the wilful default, recklessness, gross negligence or bad faith of the Monitoring Trustee (or, where appropriate, its employees, advisors and agents).

8.2.7 At the expense of the Parties, the Monitoring Trustee may appoint advisors, subject to the Commission's prior approval, if the Monitoring Trustee considers the appointment of such advisors necessary for the performance of its duties under the mandate, provided that any fees incurred are reasonable and upon consultation of the Parties.

8.3 TERMINATION OF MANDATE

8.3.1 If the Monitoring Trustee ceases to perform its functions under the Commitments or for any other good cause, including the exposure of the Monitoring Trustee to a conflict of interest:

(i) the Commission may, after hearing the Monitoring Trustee, require the Parties, to replace the Monitoring Trustee; or

(ii) the Parties, with the prior approval of the Commission, may replace the Monitoring Trustee.

8.3.2 If the Monitoring Trustee is removed the Monitoring Trustee may be required to continue in its function until a new Monitoring Trustee is in place to whom the Monitoring Trustee has affected a full hand over of all relevant information. The new Monitoring Trustee shall be appointed in accordance with the procedure referred to Section 8.1.2.

8.3.3 Aside from being removed in accordance with Section 8.3.1, the Monitoring Trustee shall cease to act as Monitoring Trustee only after the Commission has discharged it from its duties. However, the Commission may at any time require the reappointment of the Monitoring Trustee if it subsequently appears that the Commitments might not have been fully and properly implemented.

9 FAST TRACK DISPUTE RESOLUTION

9.1 In the event that a Prospective New Entrant or a New Air Services Provider has reason to believe that the Parties are failing to comply with the requirements of the Commitments vis-à-vis that party, the fast track dispute resolution procedure described in this Section 9 will apply.

9.2 Any Prospective New Entrant or New Air Services Provider who wishes to avail itself of the fast track dispute resolution procedure ("Requesting Party") must notify the Parties in writing setting out in detail the reasons leading that party to believe that the Parties are failing to comply with the requirements of the Commitments ("Notice"). The Requesting Party and the Parties will use their best efforts to resolve all differences of opinion and to

settle all disputes that may arise through co-operation and consultation within a reasonable period of time not to exceed fifteen (15) business days after receipt of the Notice.

- 9.3 Should the Requesting Party and the Parties fail to resolve their differences of opinion through cooperation and consultation as provided for in Section 9.2, the Requesting Party shall nominate an arbitrator.
- 9.4 The Parties shall, within two (2) weeks of receiving notification in writing from a Requesting Party of the appointment of the Requesting Party's arbitrator, nominate its arbitrator and provide to the Requesting Party in writing detailed reasons for its challenged conduct.
- 9.5 The arbitrators nominated by the Parties and the Requesting Party shall, within one (1) week from the nomination of the former, agree to appoint a third arbitrator. If the arbitrators nominated by Lufthansa and the Requesting Party cannot agree on the nomination of a third arbitrator, they shall ask the President of the International Chamber of Commerce ("ICC") to appoint the third arbitrator.
- 9.6 The arbitrators shall be instructed to establish an arbitration tribunal and to make a preliminary ruling on the contested issues within one (1) month of the appointment of the third arbitrator, which may be extended, if necessary, by the unanimous agreement of all arbitrators. The preliminary ruling shall be applicable immediately and until the final decision is issued. The final decision shall be taken by the arbitrators within six (6) months of the appointment of the third arbitrator, which may be extended, if necessary, by the unanimous agreement of all arbitrators.
- 9.7 In their preliminary ruling and their final decision, the arbitrators shall also decide the action, if any, to be taken by the Parties in order to ensure compliance with the Commitments vis-à-vis the Requesting Party, including making a preliminary or final binding determination of the disputed contractual conditions.
- 9.8 Any of the arbitrators will be entitled to request any relevant information from the Parties or the Requesting Party in order to enable the arbitrators to reach a decision.
- 9.9 The burden of proof in any dispute under this fast track dispute resolution procedure shall be borne as follows: i) the Requesting Party must produce evidence of a *prima facie* case, and ii) if the Requesting Party produces evidence of a *prima facie* case, the arbitrator must find in favour of the Requesting Party unless the Parties can produce evidence to the contrary.
- 9.10 The arbitrators shall be instructed not to disclose confidential information and to apply the standards attributable to confidential information and business secrets by European Community competition law.

- 9.11** The arbitration shall be in English and conducted pursuant to the ICC rules. The arbitration award shall, in addition to dealing with the merits of the claim, impose the fees and costs of the prevailing party upon the party that is unsuccessful. The arbitration award shall be final and binding on the parties.
- 9.12** In the event of disagreement between the parties to the arbitration regarding the interpretation of the Commitments, the arbitrators shall inform the Commission and may seek the Commission's interpretation of the Commitments before finding in favour of any party to the arbitration. The Commission may, at any time, issue a submission during the arbitration procedure.
- 9.13** Nothing in the arbitration procedure shall affect the powers of the Commission to take decisions in relation to the Commitments in accordance with its powers under the Merger Regulation and the EC Treaty.

10 GENERAL PROVISIONS

- 10.1** If the Concentration is abandoned, abrogated, unwound, not approved or disapproved by a relevant Government Authority, or otherwise terminated, then these Commitments shall automatically cease to apply.
- 10.2** If the approval of the Concentration by another governmental authority is made subject to requirements that are potentially inconsistent with these Commitments, Lufthansa may request a review and adjustment of these Commitments in order to avoid such inconsistencies.

11 REVIEW SECTION

- 11.1** The Commission may, if appropriate, in response to a request from Lufthansa duly justified and provided together with the relevant report prepared by the Monitoring Trustee, in exceptional circumstances, waive, modify or substitute one or more of the obligations stated in these Commitments, in particular as regards the necessity of making available a fifth slot to a Non-Star Alliance Applicant to ensure effective competition on the Vienna-Frankfurt route.

11.2 The Commission may, if appropriate, in response to a request from Lufthansa duly justified and provided together with the relevant report prepared by the Monitoring Trustee, grant an extension of the terms foreseen in these Commitments. In case Lufthansa asks for any term extension, such a request shall be filed no later than one (1) month before the end of the period. Only in exceptional circumstances shall Lufthansa be entitled to request an extension within the last month of any period.

COMMISSION DECISION

of 16.5.2012

addressed to:

SÜDZUCKER AG MANNHEIM/OCHSENFURT

**declaring a concentration to be compatible with the internal market
and the functioning of the EEA Agreement
(Case M.6286-SÜDZUCKER/ ED&F MAN)**

(Only the English text is authentic)

THE EUROPEAN COMMISSION,

Having regard to the Treaty on the Functioning of the European Union,

Having regard to the Agreement on the European Economic Area, and in particular Article 57 thereof,

Having regard to Council Regulation (EC) No 139/2004 of 20 January 2004 on the control of concentrations between undertakings¹, and in particular Article 8(2) thereof,

Having regard to the Commission's decision of 9 November 2011 to initiate proceedings in this case,

Having given the undertakings concerned the opportunity to make known their views on the objections raised by the Commission on 14 February 2012,

Having regard to the opinion of the Advisory Committee on Concentrations,

Having regard to the final report of the Hearing Officer in this case,

WHEREAS:

1. INTRODUCTION

- (1) On 19 September 2011, the Commission received a notification of a proposed concentration pursuant to Article 4 of Regulation (EC) No 139/2004 (the "Merger Regulation")² by which the undertaking Südzucker Holding GmbH, controlled by Südzucker AG Mannheim/Ochsenfurt ("Südzucker", Germany), acquires within the

¹ OJ L 24, 29.1.2004, p.1.

² OJ L 24, 29.1.2004, p.1.

meaning of Article 3(1)(b) of the Merger Regulation control of ED&F Man Holding Limited ("EDFM", United Kingdom) by way of purchase of shares (the "proposed transaction"). Südzucker and EDFM are designated hereinafter as the "Parties" while Südzucker is the "notifying party".

2. THE PARTIES

- (2) Südzucker is a German food company active in the areas of sugar production and marketing, food additives, frozen food, portioned food articles, bioethanol production and fruit juices concentrates and preparations. The sugar segment covers white sugar production from beet as well as the refining of raw cane sugar and marketing of sugar and by-products. Südzucker produces sugar in 29 beet sugar factories and three refineries in Germany, Belgium, Bosnia-Herzegovina, France, Poland, Austria, Slovakia, the Czech Republic, Hungary, Moldova and Romania.
- (3) EDFM is primarily a commodity trading company. Its product portfolio comprises sugar, liquid by-products of sugar production such as molasses (liquid-products segment), coffee, tropical oils and biofuels (primarily biodiesel, ethanol is not supplied in the EEA). The company also provides logistic services (storage and transportation) and financial services.

3. THE OPERATION AND THE CONCENTRATION

- (4) Pursuant to a Subscription Agreement and the New Articles of Association of EDFM (as amended by a Deed of Variation signed on 24 August 2011), Südzucker will acquire 24.99% of EDFM's share capital. Pursuant to paragraphs 54 to 57 of the Commission Consolidated Jurisdictional Notice under Council Regulation (EC) No 139/2004 on the control of concentrations between undertakings (the "Jurisdictional Notice")³ sole control may be acquired *de jure* by a minority shareholder if it obtains the ability to exercise decisive influence over the other undertaking's strategic commercial behaviour⁴. The Subscription Agreement and the Articles of Association grant Südzucker strong veto rights in particular over the annual budget, business plan and appointment of directors^{5*}. No other shareholder will enjoy such veto rights⁶.

³ OJ C/95, 16.4.2008, p. 1.

⁴ See Jurisdictional Notice, paragraph 54: "*Sole control is acquired if one undertaking alone can exercise decisive influence on an undertaking. Two general situations in which an undertaking has sole control can be distinguished (...) Second, a situation also conferring sole control exists where only one shareholder is able to veto strategic decisions in an undertaking, but this shareholder does not have the power, on his own, to impose such decisions (the so-called negative sole control).*" And paragraph 57: "*Even in the case of a minority shareholding, sole control may occur on a legal basis in situations where specific rights are attached to this shareholding. These may be preferential shares to which special rights are attached enabling the minority shareholder to determine the strategic commercial behaviour of the target company, such as the power to appoint more than half of the members of the supervisory board or the administrative board. Sole control can also be exercised by a minority shareholder who has the right to manage the activities of the company and to determine its business policy on the basis of the organisational structure*".

⁵ For instance [...]*.

* Parts of this text have been edited to ensure that confidential information is not disclosed; those parts are enclosed in square brackets and marked with an asterisk.

⁶ The current major shareholders of EDFM are [...]* of EDFM's shares, [...]* of the shares and [...]*.

Therefore, the proposed transaction will lead to negative sole control within the meaning of paragraph 54 of the Jurisdictional Notice⁷.

- (5) The proposed transaction thus constitutes a concentration within the meaning of Article 3(1)(b) of the Merger Regulation.

4. UNION DIMENSION

- (6) The undertakings concerned have a combined aggregate world-wide turnover of more than EUR 5,000 million [...]*. Each of them has a Union-wide turnover in excess of EUR 250 million [...]*. Neither of the undertakings achieves more than two-thirds of its aggregate Union-wide turnover within one and the same Member State.
- (7) The proposed transaction therefore has a Union dimension within the meaning of Article 1(2) of the Merger Regulation.

5. THE PROCEDURE

- (8) Based on its first phase investigation, the Commission raised serious doubts as to the compatibility of the proposed transaction with the internal market and adopted a decision to initiate proceedings pursuant to Article 6(1)(c) of the Merger Regulation on 9 November 2011 (the "Article 6(1)(c) decision").
- (9) The notifying party submitted its written comments on the Article 6(1)(c) decision on 17 November 2011.
- (10) A non-confidential version of certain key statements of third parties collected during the first phase investigation was provided to the Parties on 24 November 2011.
- (11) On 14 February 2012, the Commission adopted a Statement of Objections (the "SO") pursuant to Article 18 of the Merger Regulation.
- (12) By submission of 28 February 2012 Südzucker responded to the Statement of Objections and asked for an Oral Hearing.
- (13) On 5 March 2012 an Oral Hearing took place. As a third party, Società Fondiaria Industriale Romagnola SpA ("SFIR") attended the Oral Hearing.
- (14) The meeting of the Advisory Committee took place on 25 April 2012.

⁷ See Jurisdictional Notice, paragraph 54: "*Sole control is acquired if one undertaking alone can exercise decisive influence on an undertaking. Two general situations in which an undertaking has sole control can be distinguished (...) Second, a situation also conferring sole control exists where only one shareholder is able to veto strategic decisions in an undertaking, but this shareholder does not have the power, on his own, to impose such decisions (the so-called negative sole control).*"

6. ASSESSMENT

- (15) The proposed transaction concerns the acquisition of sole control by Südzucker, the largest European sugar producer, of EDFM, the second largest sugar trader worldwide. EDFM is also active in the production of sugar in Europe via two refineries; the SFIR Raffineria di Brindisi ("SRB" or the "Brindisi refinery") in the South of Italy and the Sociedade de Desenvolvimento Agro-Industrial, S.A. (the "DAI refinery") in Coruche, Portugal.
- (16) The proposed transaction results in potentially affected markets for (i) the supply of white sugar in Italy and Greece, (ii) the supply of preferential raw cane sugar in the EEA, and (iii) the supply of molasses in several Member States, mainly in Central Europe. The competitive assessment will therefore focus on the markets for sugar and molasses, which are elaborated separately in the following sections of this Decision.

6.1. THE SUPPLY OF WHITE SUGAR TO ITALY AND GREECE

6.1.1. INTRODUCTION TO THE SUGAR INDUSTRY

6.1.1.1. The production of sugar

- (17) Sugar (the proper term is sucrose⁸) is the most common sweetener. It can be found in many natural foods (e.g. fruits and vegetables) but can only be extracted from sugar beet and sugar cane.
- (18) Sugar is a relatively homogeneous product. Although some variations of sugar exist on the market, such as liquid or specialty sugars, the vast majority of sugar sold is so-called "granulated white sugar".
- (19) Sugar has many different uses in industrial processing. It can be used as: a sweetener, a preservative, a flavour enhancer, a bulking agent in other foods, a food for yeast to aid fermentation in baking and brewing, a means to raise boiling or lower freezing points (e.g. in ice cream) and as an enhancer of the texture and shelf-life of certain foods (sugar absorbs moisture and provides a crunchy feel). Only around 30% of all sugar used in Europe is destined for direct consumption⁹.
- (20) Sugar is produced either from sugar beet, which is grown in Europe and elsewhere and processed into sugar locally, or from sugar cane, grown in more tropical climates.
- (21) Both sugar cane and sugar beet are increasingly used in the production of bio-fuels. Due to higher oil prices in recent years, Brazil is currently streaming more sugar cane yields into the ethanol industry in order to lower gasoline prices. In the Union, the use of bio-fuels in gasoline is also increasing, due to regulation at both Union and Member State levels calling for decreases in CO₂ emissions.

⁸ Sucrose may be hydrolisated into two molecules: glucose and fructose which are also sweeteners.

⁹ See CBI report on sugar, June 2009.

- (22) Currently, 80% of world sugar production is based on cane, while most of the sugar consumed in the Union is still beet sugar. However, since the reform of the sugar regime in the Union in 2006 a higher percentage of Union production is based on raw cane sugar.
- (23) Sugar production from beet involves extracting the beet sugar content with water into a raw juice solution which is then filtered, purified and evaporated to remove moisture and impurities and then concentrated until crystallisation occurs. This juice is in turn put through a centrifugal process to which small crystals are added in order to act as a nucleus for the crystallisation process. At the end of this process, crystallised sugar is dried, stored and packed according to end-use markets, i.e. generally in bulk, 1 tonne and 50 kg bags for industrial and merchant customers and in 1 kg or smaller packets for retail customers.
- (24) Sugar cane is a tropical grass which is harvested mechanically or by hand. Unprocessed cane sugar is not imported into the Union. Indeed, the sugar content per unit of weight is much lower for unprocessed sugar cane than for semi-processed raw cane sugar. Therefore, the import of unprocessed sugar cane would not be economical compared with the import of semi-processed raw cane sugar. Rather, the sugar cane is processed at a mill in the country of origin and the resulting raw cane sugar is then shipped to the Union as a product for further processing (refining). Alternatively, raw cane can be refined into the final product locally.
- (25) The first stage of processing cane sugar is carried out in factories close to or in the growing area. The cane is cleaned, crushed and shredded and sprayed with hot water in order to extract the juice. The juice is then further processed to create "raw cane" or raw cane sugar, which is an off-white sugar that is partly purified and is in a concentrated, crystallised, microbiologically stable form (so-called "semi-processed form") suitable for bulk handling, storage and transportation to refineries.
- (26) At the sugar refinery, the remaining impurities in the raw cane are removed through a second onward processing/refining stage which in itself is a complex process comprising various distinct stages (including affination and melting; carbonation and filtration; decolourisation; evaporation and crystallisation; and separation and drying).
- (27) White sugar production from raw cane sugar is mainly done in specialised refineries, i.e. refineries that are optimised for raw cane sugar and in which sugar cannot be produced from processing sugar beet. This is the case for EDFM's refinery in Brindisi as well as Südzucker's refinery in Marseille.
- (28) It is also possible to refine raw cane sugar in factories that are mainly dedicated to beet processing but this requires some significant modifications¹⁰. In the Union some beet sugar factories have been equipped in such way. This is the case for example in a factory of the Eridania group in Minerbio (Italy) and Südzucker group in Romania.

¹⁰ An ion exchanger for decolourization would have to be added. The crystallization process would have to be modified, but the same machinery (crystallizers, pumps, centrifuges, sugar drier etc.) can be used. Some equipment like flow transport devices or tubes, the automation systems and some other devices must be modified.

6.1.1.2. The Union regime prior to the sugar reform of 2006

- (29) The sugar common market organisation (CMO) was set up in 1967¹¹ to ensure a fair income to Community producers and to stabilise the market. Union producers could sell sugar at guaranteed prices, i.e. intervention prices which in the period 1996–2006 were significantly higher than the international market price.

Graph 1: Prices for white sugar from 1996 to 2006¹²

- (30) Production quotas distributed amongst the Member States kept the overall production within certain limits. Levies were applied on imports and sugar surpluses were exported. Sugar which had been produced within the quotas but in excess of internal market requirements was exported with export refunds (or stored). No export refunds were granted for the export of sugar which had been produced in excess of the quotas.
- (31) Prior to the 2006 sugar reform, the Union was the third largest sugar producer in the world with annual production in excess of 20 million tonnes and was the second largest consumer¹³ [...] ¹⁴.

¹¹ CMO was set up by Regulation No 1009/67/EEC of the Council of 18 December 1967 on the common organisation of the market in sugar (OJ 308, 18.12.1967, p. 1). Currently CMO is governed by Council Regulation (EC) No 1234/2007 of 22 October 2007 establishing a common organisation of agricultural markets and on specific provisions for certain agricultural products (Single CMO Regulation) (OJ L 299, 16.11.2007, p. 1).

¹² Special report n°6 from the European Court of Auditors – "Has the reform of the sugar market achieved its main objectives?" - 2010.

¹³ In 2005 the Union produced 20.3 million tonnes of sugar and consumed 15.6 million tonnes. The Union imported 2.3 million tonnes of raw sugar while exports of white sugar amounted to 7.5 million tonnes, of which 2.5 million tonnes were subsidized by the EU through export refunds.

¹⁴ The Union also had a limited production of isoglucose which is derived from processing starch usually extracted from maize or from wheat or potatoes. Isoglucose is largely used in the food industry and in many cases, for instance in soft drinks, is a potential substitute for sugar. Union production of isoglucose has been limited by the establishment of a quota of marginal magnitude. Quotas of limited importance also exist for the production of inulin syrup, a sweetener obtained from a fibre extracted from the chicory root.

(32) In the years preceding the 2006 sugar reform, the Union came under increasing pressure to avoid exporting surplus quantities of sugar at subsidised rates on the world market. This pressure finally resulted in a World Trade Organisation ruling in 2005 which obliged the Union to include out-of-quota sugar exports and re-exports of ACP imports in its sugar export limit. Thus, since 2006 the Union cannot export more than 1.37 million tonnes of subsidised white sugar, instead of the previous annual average exports of 6.5 million tonnes¹⁵.

6.1.1.3. The regime put in place by the sugar reform of 2006

(33) Following the negative WTO ruling condemning in particular the export subsidies, the Union sugar regime was reformed in 2006 in order to increase the competitiveness in the sugar sector, stabilise the markets, guarantee the availability of sugar supplies and improve the market orientation of the sector by reducing some of the regulatory barriers.

(34) Therefore the Union sugar regime was reformed in 2006 and final changes took place in October 2009.

(35) Some of the main regulatory instruments remained unchanged, such as the allocation of beet sugar production quota to Member States, which in turn allocate the quotas to sugar beet processors as a precondition for the obligation to pay the minimum beet price (reference price). Whereas the 2006 sugar reform abolished intervention prices, it still maintained a system of minimum, albeit reduced, prices to be paid to beet growers. The sugar reform also suspended export refunds for sugar as of September 2008 onwards.

(36) The main features of the sugar reform were as follows¹⁶:

- (a) Significant reduction of the overall European sugar beet production through massive quota renunciation. In the first two years of the sugar reform, the expected level of voluntary quota renunciations was not achieved, as only 2.2 million tonnes instead of the targeted 6 million tonnes were renounced, indicating that the incentives offered were not deemed to be sufficiently attractive. Therefore, in 2007 several modifications were made to the reform process creating a stronger incentive for all producers to renounce at least a certain percentage of their quota. These amendments aimed at achieving the desired Union sugar market balance through a 6 million tonnes reduction of the production of sugar, isoglucose and inulin syrup. As a direct consequence of these changes, in 2008 and 2009 producers renounced around 3.6 million tonnes quotas. By 2009, total renunciations reached 5.77 million tonnes, of which 5.23 million tonnes relates to the sugar quota.
- (b) Abolition of intervention prices: reference prices, which replaced intervention prices, have been reduced by 36% over four years starting from 2006/07. The

¹⁵ Special report n°6 from the European Court of Auditors – "Has the reform of the sugar market achieved its main objectives?" - 2010 p. 9.

¹⁶ Special report n°6 from the European Court of Auditors – "Has the reform of the sugar market achieved its main objectives?" - 2010 p. 13 et seq.

2006/07 white sugar support price of EUR 631.9 per tonne was therefore reduced to EUR 404.4 per tonne by the end of the transition period in 2009/10.

- (c) Suspension of export refunds for sugar as from September 2008 on, and only limited out-of-quota exports permitted. Following to WTO sugar panel, exports of out-of-quota sugar are limited to 1.37 million tonnes.
- (d) Establishment of a temporary restructuring fund to finance compensatory payments for voluntary production quota renunciations. A restructuring fund paid a basic EUR 730 per tonne in the first two years for producers, renouncing their quotas and quitting the industry, with at least EUR 73 per tonne going to ex-growers (the fund would be paid for by a levy on continuing processors).
- (e) Tariff-free market access for sugar from the Least Developed Countries ("LDC") and from the African, Caribbean, Pacific ("ACP") countries sugar as from 1 October 2009 on (see section 5.1.1.5).

6.1.1.4. Consequence of the reform on the sugar production in the Union (internal dimension of the new regime)

- (37) From being a net leading exporter the Union has become the 2nd largest importer in the world. Quota renouncements have changed the Union market supply from a level of sugar production significantly above the internal consumption to a level of production (beet quota sugar production is currently of 13.3 million tonnes) markedly below consumption (Union domestic demand is approximately 16.7-17.1 million tonnes per year), the EU thus becoming a net importer, with Union production covering 85% of its consumption.
- (38) Those quota renouncements led to (i) a significant reduction of the Member States producing sugar, (ii) a limited number of large Union sugar producers (iii) which grew and are still growing by the way of horizontal and vertical integrations.
- (39) The Union accounts for around 9% of global sugar production¹⁷. Within the Union, France was, in 2009, the largest refined white sugar producer, accounting for almost 25% of the Union sugar production. The second largest sugar producer is Germany, accounting for approximately 22% of the Union sugar production.
- (40) The quota renouncements led to a significant reduction of the number of Member States producing sugar. While before the sugar reform 23 out of 27 Member States produced sugar from beets, after the reform five Member States stopped sugar production entirely (namely Ireland, Portugal, Slovenia, Bulgaria, Latvia), while six further Member States renounced 50% or more of their respective quota (namely Italy, Hungary, Slovakia, Greece, Finland and Spain).
- (41) Since 2000/2001, 149 sugar factories (more than 60%) have been closed, of which alone 81 sugar factories were closed between 2005/06 and 2007/08. Sugar production is now concentrated in six Member States (France, Germany, Poland,

¹⁷ Global sugar consumption reached over 162 million tonnes for the year 2007/2008 and grew to 166 million tonnes in 2008/2009, indicating a growth of 2.2% (International Sugar Organisation, 2009).

United Kingdom, Netherlands and Belgium) to which approximately 75% of the quota is allocated¹⁸.

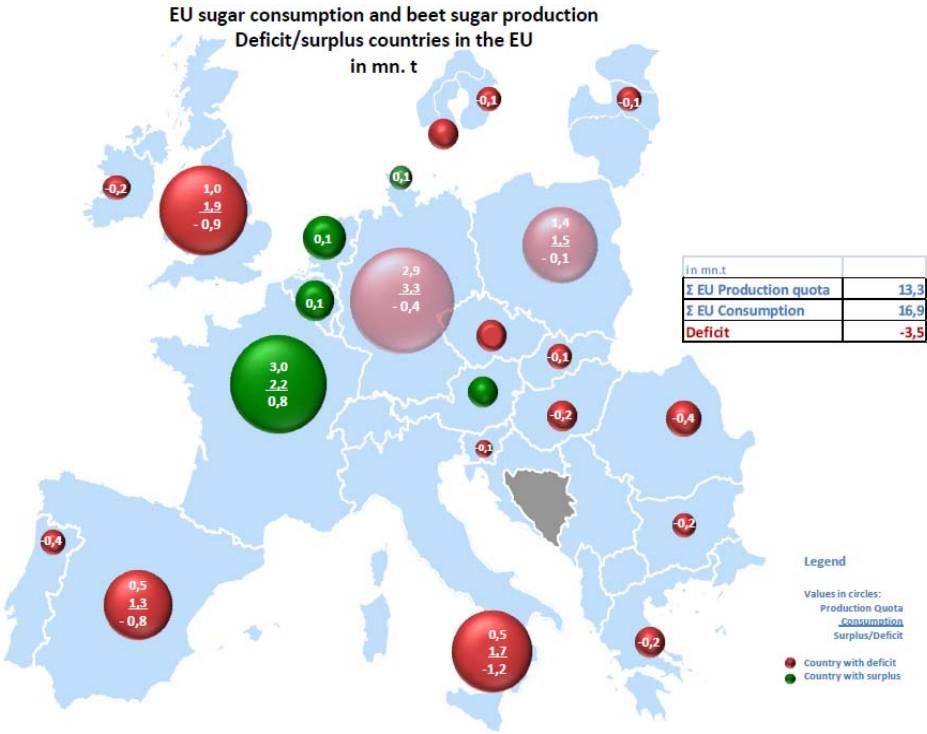

Sugar Factory closure 2001-2010

- (42) Furthermore, a large number of Member States have become sugar deficit countries in the Union with consumption exceeding domestic beet sugar production. These deficit regions are in particular southern Europe and the United Kingdom. Italy is the biggest deficit Member State followed by the United Kingdom and Spain.

¹⁸ See for instance Special Court of Auditors Report Nr 6/2010, Annex II.

Union Sugar consumption and beet sugar production

(43) As shown by the table below¹⁹, amongst the Member States which were still important sugar producers before the sugar reform, the impact has been greatest on Italy, which lost 67% of its sugar production quota between 2006 and 2009 (which represents more than 1 million tonnes).

¹⁹ Court of Auditors Report, page 49, Annex II.

Evolution of the Union sugar quotas from 2006 to 2010

Member State	Initial quotas ¹	Quota renounced for given marketing year				Quotas available from marketing year 2009/10	Percentage of total quotas renounced

(i) Union sugar production is concentrated in a few large companies

(44) The 2006 sugar reform has led to a reduction of the number of players, thus reinforcing the concentrating pre-existing trend in the Union sugar sector. Today, five corporate alliances, namely Südzucker, Nordzucker, British Sugar, Tereos and Pfeifer & Langen account for over 80% of Union sugar beet processing capacity and 72% of the Union sugar market²⁰.

²⁰ Cf Special Agritrade report, May 2010 - <http://agritrade.cta.int/Resources/Agritrade-documents/Special-reports/Corporate-restructuring-in-the-EU-sugar-sector-Implications-for-the-ACP>

The 10 main Union sugar producers – 95% of the EU quota²¹

- (45) **Südzucker AG** is the largest sugar producer in Europe with a Union sugar quota of around 25% and a yearly sugar production of 4.2 million tonnes. Südzucker produces sugar in 29 sugar factories and three refineries in Germany, Belgium, Bosnia-Herzegovina, France, Poland, Austria, Slovakia, the Czech Republic, Hungary, Moldova and Romania.
- (46) **Nordzucker** is the second largest sugar manufacturer in Europe with an estimated Union-wide quota of 16%. The company runs five sugar beet processing factories in Germany. These are located in Sachsen-Anhalt and Niedersachsen. Additionally, there are sugar factories in Denmark, Finland, Lithuania, Poland, Slovakia and Sweden, and raw cane sugar refineries in Sweden and Finland.
- (47) **British Sugar plc** is a subsidiary of Associated British Foods and the sole British producer of sugar from sugar beet. British Sugar processes all sugar beet grown in the United Kingdom and produces about half of the United Kingdom's quota of sugar, with the remainder covered by Tate & Lyle and imports. They hold around 11% of the Union quota with four beet processing plants in the United Kingdom, three beet processing plants in northern Spain and cane sugar refinery in the South of Spain.
- (48) **Tereos** has an estimated sugar production quota of 11% in the Union and is the largest sugar manufacturer in France. The company operates nine sugar factories in France, two in the Czech Republic, and one raw cane sugar refinery in Spain. Outside the Union Tereos operates two sugar factories in La Reunion, one in Mozambique and seven in Brazil. Refineries are located in Mozambique and Brazil.
- (49) **Pfeifer & Langen** has an estimated sugar production quota of 8% in the Union and produces around 100,000 tonnes of beet molasses p.a. in Germany. It has sugar-related operations in Germany, Czech Republic, Poland, Italy, Slovenia, Croatia, Ukraine, Romania, Hungary and Greece. The company runs six sugar factories in Germany, four of which are located in the very western part of Germany close to the

²¹ Graph available on the "Rapport d'activité 2011 from Confédération Générale des planteurs de betteraves" <http://www.cgb-france.fr/IMG/pdf/RapportDactivite-2011-Web.pdf> p.6.

Dutch and Belgian border. P&L is also the third largest sugar manufacturer in Poland with four beet sugar factories. It also operates a sugar factory in Romania.

(50) In its decision on the merger *Nordzucker/Danisco* (B2-46/08), the Bundeskartellamt considered that the German sugar market was dominated by an oligopoly of Nordzucker and Südzucker and that those companies created "sealed off" regional distribution areas, which they mutually respected. Sugar companies agreed on avoiding price competition within Germany by increasing activities in deficit countries regardless of high transport costs. The Bundeskartellamt has finally cleared the acquisition of Danisco by Nordzucker under the condition that Danisco's production plant in northern Germany (Anklam/Mecklenburg-Western Pomerania) is sold to a suitable purchaser before the acquisition is realized. The purchaser proposed by the parties, the Dutch sugar producer Royal Cosun ("Cosun"), has been accepted by the Bundeskartellamt.

(ii) The increasing trend towards horizontal and vertical integrations

(51) Due to the impact of the 2006 Union sugar reform, many Member States have become sugar deficit countries in the Union. In these countries where the demand is much higher than local production, the leading sugar producers in the Union have used different ways in order to be present. For instance, Nordzucker acquired the Scandinavian producer Danisco while ABF acquired the Spanish refiner Azucarera. In Italy, the traditional Italian sugar manufacturers, such as Eridania-Sadam, Italia Zuccheri S.p.A. ("Italia Zuccheri") and SFIR, have been trying to keep their "pre-reform" market share. In that context, they have established joint ventures mainly with manufacturers from surplus Member States, in order to satisfy the demand of their customers.

(52) Thus, the German sugar manufacturer Pfeiffer & Langen acquired 49.9% of Italia Zuccheri, while Tate & Lyle (recently replaced by Cristal Union) established a joint venture with Eridania for the marketing and sales of all sugar products. SFIR has taken a different approach by building a new refinery in a joint venture with EDFM in the South of Italy. SFIR also bought white sugar from other players, such as Eurosugar (Nordzucker, Sucre Union, and EDFM) in order to satisfy the demand of its customers. Other sugar manufacturers, such as Tereos, entered the market by establishing local distribution companies. Finally Südzucker, the leading supplier in Italy, markets and sells refined sugar through the joint venture Maxi Srl – a well-known Italian wholesaler, which Südzucker jointly controls together with Podini Holding S.p.A ("MAXI").

(53) To balance the lower sugar production, a few European beet sugar producers have tried to secure their own raw cane sugar supplies from ACP and LDC countries either by creating powerful integrated players – (e.g. ABF through Illovo which controls a significant amount of raw cane in Malawi, Zambia, Swaziland, Mozambique and Tanzania) – or through strong partnerships with players in those

countries (e.g. Südzucker in Mauritius, Tereos in Mozambique, Tate & Lyle in Barbados, Belize, Cambodia, Fiji, Guyana and Laos)²².

6.1.1.5. Consequence of the reform on the trade between the Union and third countries (external dimension)

- (54) Since the reform of the Union sugar industry was initiated in 2006/07, it was expected that the Union domestic demand of approximately 16.7-17.1 million tonnes per annum would be covered by Member State beet quota sugar production of 13.3 million tonnes, with the remainder covered by imported sugar from traditional preferential trade partners²³. However, between then and now this has not been the case notably because expected imports from LDC/ACP-countries have been below the Commission's expectations, with the result that quota stock levels have progressively fallen.
- (55) At the moment, raw cane sugar for refining may be imported into the Union from third countries under the following customs schemes:
- (i) Sugar imports from ACP/LCP countries - Everything But Arms initiative and Economic Partnership Agreements
- (56) On 26 February 2001, the "Everything But Arms" (EBA) amendment to the EU's Generalised Scheme of Preferences (GSP) was adopted. EBA extended duty and quota free access to all products originating in Least Developed Countries (LDCs), except arms and ammunition. However, three sensitive products, namely sugar, bananas and rice were not liberalised until 1st October 2009.
- (57) On 23 June 2000, a new Partnership Agreement between the 77 ACP countries and the then 15 Member States was signed in Cotonou. The ACP-EU Sugar Protocol was annexed to Annex V of the Cotonou Partnership Agreement. Compared with the Lomé Conventions, the Cotonou trade regime paved the way for a profound transformation, preserving non-reciprocal tariff preferences until 31st December 2007, but replacing them as from 2008 with trade arrangements agreed in reciprocal Economic Partnership Agreements (EPAs) compatible with the rules of the World Trade Organisation (WTO).
- (58) From 2001 until 2009, imports of sugar from LDCs were restricted by an annual first-come-first-served quota. In the 2001/02 marketing year, the quota was fixed at

²² See answer of Südzucker to the third request of information. See also <http://agritrade.cta.int/en/Welcome-to-Agritrade> (Agritrade is the website for ACP-EU agriculture and fisheries trade issues).

²³ Even though the Commission decided to suspend export refunds for sugar from September 2008, the Union still exports between 500,000 tonnes and 1 million tonne of sugar/year, see Commission Regulations (EC) No 900/2007 of July 2007 on a standing invitation to tender to determine refunds on exports of white sugar until the end of the 2007/2008 marketing year (OJ L 196, 28.7.2007, p. 26), Commission Regulation (EC) No 947/2008 of 25 September 2008 suspending the export refunds on white and raw sugar exported without further processing (OJ L 258, 26.9.2008, p. 60), Commission Regulation (EC) No 948/2008 of 25 September 2008 suspending the export refunds on syrups and certain other sugar products exported without further processing (OJ L 258, 26.9.2008, p. 61) and Commission Regulation (EC) No 951/2008 of 25 September 2008 fixing the rates of refunds applicable to certain products from the sugar sector exported in the form of goods not covered by Annex I to the Treaty (OJ L 258, 26.9.2008, p. 66).

74,185 tonnes w.s.e., and was increased by 15% (compound) per annum until 2008/09. The EBA quota did not increase the raw sugar access or availability to the Union market because that quantity reduced tonne-for-tonne the amount of SPS/CQ required from the ACP suppliers.

- (59) With the tacit approval of the Commission, the LDC Ambassadors based in Brussels agreed a “EBA Sugar Framework Agreement” which allocated the overall annual EBA quantity on the basis of a formula (based one third on GDP per capita, one third sugar production and one third in equal shares) which ensured that every LDC sugar supplier which wanted to ship to the Union in any year could register and would be allocated a meaningful share by the Ambassadors in accordance with the agreed formula.
- (60) As from 1 October 2009, in accordance with the provisions of the EPAs, the ACP and the Union agreed to duty-free-quota-free (“DFQF”) access for ACP sugar to the Union markets, subject to a the transitional safeguard mechanism for sugar of 3.5 million tonnes per annum fixed in Article 9 (1)(b) of Council Regulation (EC) No 1528/2007 of 20 December 2007 applying the arrangements for products originating in certain States which are part of the African, Caribbean and Pacific (ACP) Group of States provided for in agreements establishing, or leading to the establishment of, Economic Partnership Agreements²⁴. At the same time, the DFQF for sugar was also extended to the LDCs under the EBA initiative with a non-automatic safeguard clause. Taking into account the number of ACP countries involved, the EPA regime applies to almost half the ACP countries (36 countries), and the EBA regime applies to 31 countries. All 19 ACP beneficiaries of the Sugar Protocol will come either under the EPA (17 countries) or the EBA regime (2 countries). The only ACP countries excluded from the preferential regime are the 10 non-LDCs that have neither signed nor initialed an EPA with the Union.

(ii) CXL quotas

- (61) In the wake of the accession of Austria, Finland and Sweden, and in the context of the conclusion of the negotiations under Article XXIV of the General Agreement on Tariffs and Trade (GATT), the Union undertook to import from third countries, from 1st January 1996, a quantity of raw cane sugar for refining, known as the CXL sugar quota, at a rate of duty of EUR 98 per tonne. The quota was originally set at 85,463 tonnes (of which 58,969 tonnes was assigned to Cuba and 23,930 tonnes to Brazil).
- (62) The quota was further expanded to its current level in 2007 following the accession of Bulgaria and Romania to the Union and negotiations under Article XXIV:6 of the GATT. The current CXL quotas are presented in the table below.

²⁴ OJ L 348, 31.12.2007, p. 1.

Country	Access
Australia	9,925
Brazil	334,054
Cuba	68,969
Erga Omnes (3rd Countries)	253,977
India	10,000
TOTAL	676,925

(iii) Exceptional tariff rate quotas

- (63) Special rules have been agreed for exceptional tariff rate quotas (TRQs) for sugar, these exceptional quotas being deemed necessary from time to time by the Commission in case of exceptional market conditions (Article 186 and/or 187 of Council Regulation (EC) No 1234/2007 of 22 October 2007 establishing a common organisation of agricultural markets and on specific provisions for certain agricultural products²⁵ (the "Single CMO Regulation")).

(iv) Other sugar import custom schemes

- (64) Sugar can also be imported from the world market under most favoured nation (MFN) conditions on payment of the appropriate import duties, notably EUR 419 per tonne for white and direct consumption sugars and EUR 339 per tonne for raw sugar for refining, plus additional special safeguard (SSG) duties.

- (65) The system of import licenses is regulated by framework rules set by the Commission²⁶.

(v) However the volumes available of raw cane sugar are insufficient for the Union refineries

- (66) The access to raw sugar from ACP/LDC countries or under CXL quotas is crucial and strategic for Union sugar producers since it is the only raw cane sugar that can be imported without prohibitive duties and quantities into the Union.

- (67) In the sugar marketing year 2010/11 the expected use of sugar in the Union was around 17.2 million tonnes. Thereof 13.8 million tonnes were supplied by beet quota sugar production of the marketing year and 1.1 million tonnes by CXL and Balkan import quotas. The 700,000 tonnes under CXL quotas consisted almost exclusively of raw cane sugar for refining while the 400,000 tonnes imported from the Balkans was white sugar for direct consumption.

²⁵ OJ L 299, 16.11.2007, p. 1.

²⁶ Commission Regulation (EC) No 376/2008 of 23 April 2008 laying down common detailed rules for the application of the system of import and export licenses and advance fixing certificates for agricultural products. In addition, for ACP/LDC and CXL sugar from a named origin, an export licence is required in order to apply for an EU import licence. These export licences must be certified and authenticated by the competent authorities of the originating country, thereby giving the exporting country the wherewithal and moreover the obligation (under customs cooperation agreements) to control the export marketing of the sugar originating in its territory.

- (68) The remaining 2.3 million tonnes were partially covered by [...] * tonnes of imports from ACP/LDC producers, [90-100] *% of which being raw cane sugar for refining and [10-20] *% white sugar for direct consumption²⁷.
- (69) Therefore, for the marketing year 2010/2011, about 2.5 million tonnes of preferential raw cane sugar for refining (including raw sugar from ACP/LDC countries and raw sugar under CXL quotas) were imported into the EEA. This is less than what was necessary to close the gap with European demand. One reason for that gap was that international market prices²⁸ increased significantly relative to Union prices. Another reason was that the ACP and LDC countries were not able to expand their sugar production as fast as initially expected.
- (70) Due to unavailability of raw cane sugar, cane sugar refineries are currently operating well below capacity in the EEA as shows the figure below.

Estimated supply and demand for raw cane sugar for refining in the Union²⁹

[...] *

6.1.1.6. Significant price increase in the Union

- (71) European prices for sugar, at least initially, fell drastically. At the beginning of the 2010/11 marketing year (starting from 1 October 2010) the international market price for sugar were even at a higher level than the Union sugar price as a consequence of shortfalls in important sugar producing countries, such as Mauritius, Fiji, Guyana, Swaziland and Brazil. Whereas one of the recommendations of the special report of the European Court of Auditors was that "[t]he Commission and the Member States must ensure that competition law is correctly enforced in the sector thus ensuring the Treaty objective that supplies reach consumers at reasonable prices"³⁰, the press in several Member States has recently reported however significant price rises in particular of retail sugar. In some Member States such price rises seem to reach 30 to 40 %. [...] *.

²⁷ See 3rd request for information to EDFM. 10/12/2011.

²⁸ The spot prices determined for raw sugar on the two main futures markets, London (LDP) and New York (NY spot price), are considered to be indicators of the world price. The International Sugar Organisation spot price is calculated daily from these two prices. The key indicator price for refined white sugar is the London LIFFE Contract Number 5.

²⁹ Estimates from EDFM in the submission entitled "The European Union market for raw cane sugar for refining and the place of ED&F Man in that market".

³⁰ Court of Auditors Report, paragraph 102, Recommendation IV.

Union and international market white sugar prices³¹

- (72) Article 187 of Council Regulation (EC) No 1234/2007 states that, in the event of sugar prices reaching a level that disrupts or threatens to disrupt the availability of supply on the Union market and where that situation is likely to continue or to deteriorate, the Commission may, in particular, suspend the usual MFN import duties in whole or in part for certain quantities.
- (73) In the Union sugar sector, such an event was recorded during the 2010/11 season, when it became clear that high international market prices were leading to a very low level of Union sugar stocks. Given the situation in March 2011, the Commission opened an 'exceptional' import quota for 300,000 tonnes at zero duty for raw and white sugar. When it became clear that this quantity would not be enough to cover a projected shortfall in the Union market, a second 'exceptional' import quota for 200,000 tonnes was opened at the end of May 2011.
- (74) The rule for allocating licences was the "simultaneous examination method"³², and given the high margins that were available at the time, each quota was heavily oversubscribed (for example, for the first quota a final allocation coefficient of 1.8053% was fixed, implying that import licences for applications for 16.6 million tonnes were received). According to the Parties, a consequence of this was that the final awarded tonnages were small (for example, if an operator had applied for the full first 300,000 tonne quota, they ended up receiving just 5.400 tonnes).

³¹ Annex 7.8 e) Form CO.

³² In the case of tariff quotas, e.g. for CXL sugar, applications are administered according to the "simultaneous examination method". In accordance with the rules of this method, applicants may not lodge more than one import licence application for the same quota order number each week; where an applicant lodges more than one application per order number per week, none of his applications will be admissible. An application may not relate to a quantity exceeding the total quantity of the quota. If the Commission receives more applications than total quota available in any week, it will fix an allocation coefficient to apply to each licence application. The allocation coefficient will be calculated as follows: [(available quantity/requested quantity) × 100] %.

- (75) Against this backdrop, and with Union supply shortages still not alleviated, the Commission opened a third ‘exceptional’ import quota on 29th June 2011. However, the mechanism for allocating import licences to Union operators was not the same; instead the Commission decided on a tendering procedure for raw and white sugar imports. Under this scheme, five tenders were opened between July and September, during each of which tenderers could apply for between 20 - 45,000 tonnes and the proposed amount of customs duty they were willing to pay. It was then at the Union's discretion as to the quantities and duties that were awarded after each tender. The table below shows the quantities of sugar that was awarded at each of the tenders:

EU - Results of the Tendering Scheme, 2010/11

Tender	Date	Raw Sugar for Refining		Direct Consumption Raws		White Sugar		TOTAL	
		Total Bids	Awarded	Total Bids	Awarded	Total Bids	Awarded	Total Bids	Awarded
1	14/07/2011	260,800	55,000	1,644	1,644	127,976	7,720	390,420	64,364
2	28/07/2011	n.a.	141,960	n.a.	200	n.a.	10,048	n.a.	152,208
3	24/08/2011	n.a.	83,535	n.a.	775	n.a.	27,440	n.a.	111,750
4	15/09/2011	n.a.	0	n.a.	1,160	n.a.	7,509	n.a.	8,669
5	29/09/2011	176,040	14,500	2,721	827	106,407	4,266	285,168	19,593
Total			294,995		4,606		56,983		356,584

Note: n.a. = not announced

- (76) Under those five tenders in 2010/11, a total of 356,584 tonnes was awarded, 85% of which was for raw sugar for refining.

- (77) As the situation of high and volatile international market prices has continued, in November 2011 the Commission once again agreed to open an exceptional import quota to be allocated under a tendering scheme for the 2011/12 marketing year. The Commission announced that it aims to allow about 300,000 tonnes to enter into the Union through the import tenders in order to cover an estimated shortfall of 700,000 tonnes (the rest being covered by the release of out-of quota sugar into the Union domestic market).

6.1.1.7. A new sugar reform is currently discussed

- (78) On 12 October 2011 the Commission published its legislative proposal for the Common Agricultural Policy (CAP) after 2013. The Commission's stated intention is to finalise the legislation and implementing rules so that the revised CAP can enter into force on 1 January 2014.

- (79) The potential expiry of quotas should not take place before September 2015 as evidenced by the document "Prospects for agricultural markets and income 2011-2020" published in December 2011 by DG AGRI³³.

- (80) At the moment, the outcome of this reform is uncertain and the end of sugar quotas faces considerable opposition as is illustrated by the press releases of the last European Council for Agriculture stating that "[t]he Council took note of the request from the Hungarian delegation on the extension of the sugar quota regime to 2020. This received varied support from the Belgian, Czech, German, Spanish, French, Lithuanian, Austrian, Portuguese, Slovak, Finnish and Romanian delegations"

³³

http://ec.europa.eu/agriculture/publi/caprep/prospects2011/fullrep_en.pdf

(14/11/2011)³⁴ and "many delegations mentioned that the end of sugar quotas scheduled for 2015 should be postponed" (28/01/2012)³⁵.

- (81) Furthermore, in his report, the MEP Albert Dess "advocates that the 2006 sugar market regime be extended at least to 2020 in its existing form and calls for suitable measures to safeguard sugar production in Europe and to allow the EU sugar sector to improve its competitiveness within a stable framework; to allow the sector to better adapt"³⁶.
- (82) Given the number of uncertainties, the reform of the CAP cannot be considered as a relevant counterfactual in the assessment of the competitive effect deriving from the proposed transaction.

6.1.1.8. Background of the Italian sugar industry

- (83) Italy is the second largest sugar consumer in the Union after Germany. In Italy, the annual demand amounts to 1.73 million tonnes of sugar³⁷. Italy is also the market with the largest sugar deficit in the Union.
- (84) In Italy the sugar is mainly sold to two types of customers: industrial processors and retailers. The following [...] ³⁸ presents the most important Italian sugar consumers:

Sugar consumers type in Italy

[...]*

- (85) Around 60% of all sugar is consumed in the North of Italy, to where sugar from closely located regions can be economically transported. Central Italy and southern Italy are in a more disadvantageous situation. According to internal documents of EDFM based on an internal logistics model, the average transportation costs in Italy amount to EUR [...] * per tonne, while the transportation costs to Central Italy and southern Italy amount to EUR [...] * per tonne.
- (86) The local production after the 2006 quota reform and prior to the launch of the Brindisi refinery covered less than 50% of the Italian demand. In Italy 15 out of 19 sugar beet factories closed after the reform and the limited domestic beet sugar production was carried out by three companies until the jointly controlled Brindisi refinery became operational in January 2011. Those three Italian producers are Eridania Sadam [description of Eridania' production]*, CO.PRO.B. s.c.a. ("COPROB")/Italian Zuccheri [description of COPROB's production]* and Zuccherificio del Molise ["ZDM"]. The rest of the Italian sugar demand is satisfied *via* imports mainly from the closely located surplus countries, in particular from

³⁷ Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 12, sent by e-mail of 1 December 2011 (19:33).

³⁸ Answer to the 6th request for information to EDFM of 11 October 2011, internal document on "Italian Market" (undated).

South-East France and especially the French producer Tereos and from southern Germany from the Südzucker.

- (87) Major European sugar producers have considered the deficit in the Italian market as a real opportunity to enter a key market. However, except Tereos which entered at a very early stage by establishing a sales office in Italy, they all teamed up with an existing Italian player in order to sell their sugar in Italy: Südzucker with MAXI, Pfeifer & Langen with Italia Zuccheri, Cristal Union with Eridania³⁹.
- (88) Other characteristics and aspects of the Italian sugar market will be analysed in more detail in the market definition and in the competitive assessment parts.

6.1.1.9. Background of the Greek sugar industry

- (89) The Greek sugar market is characterized by the presence and strength of the incumbent sugar producer, Hellenic Sugar. It is the only sugar supplier in Greece having sugar production facility in Greece⁴⁰. [description of Hellenic Sugar's production plants]*. The Hellenic Sugar's production quota amounts to [...] tonnes per year⁴¹. That quota does not cover domestic demand; therefore Greece is a sugar deficit Member State like Italy.
- (90) Other market players are, nevertheless, present in Greece via sugar imports, namely Südzucker, Tereos, Nordzucker and Pfeifer & Langen (Sugartia).

6.1.2. RELEVANT PRODUCT MARKET

6.1.2.1. Description of white sugar

- (91) The supply of sugar in the Union is regulated by the Common Market Organization (CMO), the principles of which are set out in Regulation (EC) No 1234/2007.
- (92) Depending on the sucrose content, Regulation No 1234/2007 distinguishes between "white sugar" and "raw sugar": while both refer to "*not flavoured or coloured or containing any other added substances*" sugar, "white sugar" must contain, in the dry state, 99.5 % or more by weight of sucrose. Sugar with less than 99.5 % of sucrose is considered as "raw sugar".

6.1.2.2. White sugar as compared to industrial sugar

- (93) Under the Union sugar regime, the white sugar market is divided into two segments; for quota sugar and out-of-quota sugar utilization. Different regulations apply to each segment. There are approximately 16 to 17 million tonnes of quota sugar available to the Union consisting of white sugar produced within the Union as well as white sugar imported under various quota arrangements into the Union, including quota allocated to Brazil, the Balkan countries, LDC and ACP countries (accounting for approximately 2.5 to 3 million tonnes). Quota sugar is primarily used for food

³⁹ Tate & Lyle had until last year a partnership with Eridania.

⁴⁰ Reply by Hellenic Sugar to question 65 of the Questionnaire to Sugar Suppliers/Producers in Greece – Phase II.

⁴¹ Reply by Hellenic Sugar to question 46 of the Questionnaire to Sugar Suppliers/Producers in Greece – Phase II.

applications. In contrast, out-of-quota sugar (also referred to as "industrial sugar") cannot be sold on the market for food applications but only for certain defined purposes such as alcohol, yeast production or in the chemical and pharmaceutical industry⁴². Therefore, there are significant differences between the commercialisation of quota sugar and the out-of quota sugar. The quota sugar market is regulated to a certain extent, including some elements of price regulation, whereas the out-of-quota market is less regulated and adheres more to international developments and conditions⁴³.

- (94) As the proposed transaction does not lead to any overlap or any other reason for competition concerns with respect to the supply of out-of-quota sugar in Italy or in Greece⁴⁴, this Decision will only assess the Parties' activities in the supply of quota sugar for food applications (hereinafter white sugar).
- (95) The notifying party considers that it is not necessary to further segment the white sugar market according to the origin (beet or cane), the type (such as granulated, liquid, industry specialities, etc.), or the distribution channel (food industry or retail) of sugar. According to the notifying party, the market should include all types of sugar intended for food consumption⁴⁵.

6.1.2.3. Different origins of sugar

- (96) On the basis of the market investigation, the Commission considers that, with regard to both Italy and Greece, no distinction is necessary as regards the origin of white sugar. Although, according to respondents, for very limited applications refined beet and cane sugar are not interchangeable, their vast majority considers the two types of sugar to be interchangeable. Therefore, for the purpose of this Decision, the Commission concludes that it is not appropriate to distinguish between beet sugar and cane sugar.

6.1.2.4. Different forms of white sugar

- (97) White sugar is available on the market under various forms: granulated sugar, liquid sugar, industry specialities etc.
- (98) Granulated sugar is the most common type of sugar sold in the Union, the basic product used in all industries. Liquid sugar is obtained by mixing granulated sugar with a liquid. Liquid sugar is used mainly in the beverage/soft drink industry in technically highly developed Member States, where smaller beverage producers dominate the market structure⁴⁶. The category of industry specialities refers to sugar processed for special clients' use. For example, one type of industry specialities sugar, fondant, is based on granulated sugar with the addition of glucose and various other elements.

⁴² Article 62(2) of the Regulation (EC) No1234/2007.

⁴³ Form CO, p.48.

⁴⁴ Südzucker reply to the 7th Request for Information ("RFI") in Phase II.

⁴⁵ Form CO p. 48.

⁴⁶ Form CO p.49.

- (99) The Commission and national competition authorities ("NCAs") have considered the sugar market in several cases⁴⁷. In its most recent decision⁴⁸ the Commission left open whether different types of sugar belong to the same market indicating that "*for different types of sugar there is limited substitutability from the customer's point of view since each type of sugar tends to fulfil a certain requirement and each type differs as to the texture, colour and flavour. However, from a supply-side perspective, in the market investigation most sugar producers indicated that they can easily switch production between different types of sugar without significant cost as well as within a short period of time (i.e. significantly less than one year) in order to meet the demands of customers*".
- (100) The notifying party submitted in the present case that the appropriate product market to assess the proposed transaction in this case encompasses all types of sugar (granulated, liquid etc). It refers to the Commission previous findings, as well as to the United Kingdom Competition Commission's findings in the case *James Budgett Sugars Ltd and Napier Brown Foods PLC*⁴⁹, according to which, although different sugar products may not be close substitutes for each other in certain industrial processes, there is, on the supply side, a high degree of substitutability between different types of sugar.
- (i) *Italy*
- (101) In Italy, Südzucker sells a variety of sugar products derived from further processing of white sugar. [...] ⁵⁰. Therefore, a distinction between granulated, liquid and other types of sugar is immaterial for the assessment of the proposed transaction. The Commission will therefore not consider a further segmentation according to the different types of sugar, as also put forward by the notifying party.
- (ii) *Greece*
- (102) EDFM has no overall sales of sugar in Greece, and thus also no sales of liquid sugar or industry specialities sugar to end-customers⁵¹. Therefore, a distinction between granulated, liquid and other types of sugar is immaterial for the assessment of the proposed transaction in Greece. The Commission will thus not consider a further segmentation according to the different types of sugar, as also put forward by the notifying party.

⁵⁰ [...]*.

⁵¹ Südzucker's reply to the 3rd RFI in Phase II, Annex 35-1 Form CO Greece, page 15.

6.1.2.5. Distinction according to customer types

Commission previous findings

- (103) In its previous decisions, the Commission considered a potential segmentation of the sugar supply market by distribution channel. The Commission has consistently confirmed a distinction between industrial and retail sugar in its decisions⁵²: industrial sugar is sold in large quantities to industrial customers mainly in the food and beverage industry ("white sugar sold to industrial processors"), while retail sugar is sold in small packages to end-customers primarily via retail chains ("white sugar sold to retailers").
- (104) In the case *Südzucker/Saint Louis Sucre*⁵³, the Commission concluded that in Germany a third additional market for the sugar supply can be distinguished according to the distribution channel, namely sugar for distributors' private labels. The Commission acknowledged, however, that this category is less familiar among businesses in other Member States such as France, where on the downstream retail market very little sugar is sold under distributors' private labels. Such a third distinction (i.e. to consider private label sugar as a distinct product market) was not considered by the Commission to be necessary in the case *ABF/AZUCARERA*⁵⁴.

View of the notifying party

- (105) With regard to the proposed transaction, the notifying party considers that white sugar sold to industrial processors and white sugar sold to retailers may constitute separate market segments, although they also point out the "*great degree*" of supply-side substitutability between these two categories. Indeed, the notifying party explained⁵⁵ that sugar production is a two steps process. In a first step bulk sugar is produced which is stored in most cases in sugar silos. In a second step this bulk sugar is directly sold or can be further processed and/or packed depending on the customers' demands. The ability of a producer to switch between white sugar sold to industrial processors and white sugar sold to retailers depends on the availability of free capacities for the - compared to the standard product bulk sugar - additional steps.

Commission findings in the case at hand

(i) Italy

- (106) In the Commission's view, the replies to its requests for information show that switching production from white sugar sold to industrial processors to white sugar sold to retailers may not be as easy as described by the notifying party. Although some competitors of the Parties answered positively, when asked whether, in case of a permanent price increase of 10% in Italy for white sugar sold to retailers they could

⁵² See Commission Decision 97/624/EC of 14 May 1997 in Case IV/F 3/M.34.621 Irish Sugar, OJ L 258, 22.09.1997, p. 1, recital 90, and Commission Decision 1999/210/EC of 14 October 1998 in Case IV/F 3/33.708 British Sugar, OJ L 76, 22.3.1999, p. 1, recital 59.

⁵³ Commission Decision 2003/259/EC in Case No COMP/M.2530 – Südzucker / Saint Louis Sucre.

⁵⁵ Answers to 3rd Request for Information to Südzucker, Form CO – Italy, pages 6 and 7, sent by e-mail of 1 December 2011 (19:33).

switch their production, the largest player in the retail market replied that it would not switch.⁵⁶ Furthermore, when asked to elaborate on their position, those competitors explained that, when switching production from white sugar to be sold to industrial processors to white sugar to be sold to retailers, several elements have to be considered.⁵⁷ In addition to the technical investments in order to install a packaging line, the supplier must consider the costs involved in designing the packaging, the listing fees in each Italian store and the promotion in stores which is necessary in order to become established as a retail sugar supplier. This could require significant investments (up to several millions of euros)⁵⁸.

- (107) From a demand side perspective there is also limited substitutability between products sold to retail and industrial customers. The great majority of customers responding to the market investigation consider the Commission's previous market segmentations⁵⁹ in which sugar for industrial processors and for retailers constitute separate markets to be appropriate⁶⁰. The main reason the majority of respondents consider such product market segmentation as the appropriate way to assess the competition in the sugar industry is because distribution through industrial and retail channels follows different market logics (for example in terms of marketing and packaging).
- (108) Concerning the packaging, industrial processors require their sugar delivered in bulk or large bags, whereas retail customers tend to prefer smaller packets of 1 kilogram or less.
- (109) Different competitors adopt different market positioning and, as a result, the market shares in the two markets differ significantly (see in particular recitals (336) and (337) of this Decision which discusses market shares). In particular, Eridania, which is seen as one of the most recognised brands of white sugar sold in the retail channel in Italy, has market shares several times higher in the market for white sugar sold to retailers compared to the market for white sugar sold to industrial processors. In contrast, the notifying party has significantly higher market shares for white sugar sold to industrial processors than for white sugar sold to retailers.
- (110) Some respondents to the market investigation also explained that colour or quality differences may exist between industrial and retail users⁶¹.
- (111) Overall, these differences in the packaging, distribution and customer profiles for industrial and retail sugar are also manifested by different pricing structures, with white sugar sold to retailers persistently being more expensive than white sugar sold

to industrial processors⁶². Moreover, the review of Südzucker's internal documents shows that the price difference between the white sugar sold to industrial processors and the white sugar sold to retailers is not stable [...] ⁶³.

[...]*

- (112) The Commission also notes that the distinction between white sugar for industrial processors and for retailers is also a standard industry practice. [...] ⁶⁴. [...] ⁶⁵. Moreover, the investigation shows that the split between industrial and retail customers is in line with the market segmentation used in the sector, such as the Parties' competitors, the economics studies or the business intelligence services (notably the F.O.Licht's reports⁶⁶).
- (113) For these reasons, the Commission takes the view that, for the assessment of the proposed transaction, the supply of white sugar to industrial processors and the supply of white sugar to retailers constitute separate relevant product markets.
- (114) Concerning a possible further distinction within white sugar sold to retailers, and in particular whether sugar for distributors' private labels constitutes a separate market, the market investigation has not brought to light any substantial elements supporting such a conclusion. On the contrary, it rather supports the notifying party's submission that, in Italy, the retail market is driven by price and availability rather than brand⁶⁷. If end-users may be "brand sensitive" for some other products sold in the retail chains, this seems not to be the case for sugar.
- (115) In addition, the review of Südzucker's internal documents shows that, when assessing the market dynamics in Italy, [...] ⁶⁸.
- (116) Therefore, for the purpose of this Decision, no distinction is made between private and brand label products.

(ii) *Greece*

- (117) EDFM has no sales of sugar in Greece, and thus no sales of white sugar to either industrial processors or to retailers⁶⁹. Therefore, a distinction between white sugar

⁶⁹ Südzucker's reply to the 3rd RFI in Phase II, Annex 35-1 Form CO Greece, page 15.

sold to industrial processors or to retailers is immaterial for the assessment of the proposed transaction in Greece. The Commission will thus not consider, in respect of Greece, a further segmentation according to the different types of sugar, or according to customer types.

6.1.2.6. Conclusion

- (118) For the reasons elaborated above, the Commission takes the view that, for the purpose of this Decision, the relevant product markets are the market for the supply of white sugar to industrial processors and the market for the supply of white sugar to retailers with regard to Italy, while with regard to Greece such distinction is immaterial.

6.1.3. RELEVANT GEOGRAPHIC MARKET

(i) Italy

- (119) The relevant geographic market for the assessment of the effects of the proposed transaction on competition in Italy is national.

6.1.3.1. General framework on the definition of the relevant geographic market

- (120) The general framework for the definition of the relevant geographic market is provided for in the Merger Regulation and the Commission notice on the definition of the relevant market for the purposes of Community competition law⁷⁰ (the "Notice on the definition of the relevant market").
- (121) Article 9(7) of the Merger Regulation states that "*[t]he geographical reference market shall consist of the area in which the undertakings concerned are involved in the supply and demand of products or services, in which the conditions of competition are sufficiently homogeneous and which can be distinguished from neighbouring areas because, in particular, conditions of competition are appreciably different in those areas. This assessment should take account in particular of the nature and characteristics of the products or services concerned, of the existence of entry barriers or of consumer preferences, of appreciable differences of the undertakings' market shares between the area concerned and neighbouring areas or of substantial price differences*".
- (122) As regards the supply side, paragraph 13 of the Notice on the definition of the relevant market states that "*from an economic point of view, for the definition of the relevant market, demand substitution constitutes the most immediate and effective disciplinary force on the suppliers of a given product, in particular in relation to their pricing decisions*".
- (123) As regards the demand side, paragraph 17 of the Notice on the definition of the relevant market states that "*[t]he question to be answered is whether the parties' customers would switch to [...] suppliers located elsewhere in response to a hypothetical small (in the range 5 % to 10 %) but permanent relative price increase in the [...] areas being considered. If substitution were enough to make the price*

⁷⁰ OJ C 372 of 9.12.1997, p. 5.

increase unprofitable because of the resulting loss of sales, additional [...] areas are included in the relevant market. This would be done until the set of [...] geographical areas is such that small, permanent increases in relative prices would be profitable".

- (124) Also, in accordance with paragraph 8 of the Notice on the definition of the relevant market, the relevant geographic market comprises *"the area in which the undertakings concerned are involved in the supply and demand of products or services, in which the conditions of competition are sufficiently homogeneous and which can be distinguished from neighbouring areas because the conditions of competition are appreciably different in those areas"*.
- (125) In order to gain evidence for the purposes of market definition, the Commission takes *"a preliminary view of the scope of the geographic market on the basis of broad indications as to the distribution of market shares between the Parties and their competitors, as well as a preliminary analysis of pricing and price differences at national and EEA level. [...] The initial working hypothesis will [...] be checked against an analysis of demand characteristics (importance of national or local preferences, current patterns of purchases of customers, product differentiation/brands, other) in order to establish whether companies in different areas do indeed constitute a real alternative source of supply for consumers. [...] The Commission will identify possible obstacles and barriers isolating companies located in a given area from the competitive pressure of companies located outside that area, so as to determine the precise degree of market interpenetration at national, European or global level"*.⁷¹
- (126) The Notice on the definition of the relevant market states also that, after the demand side has been analysed, *"If necessary a further check on supply factors will be carried out to ensure that those companies located in differing areas do not face impediments in developing their sales on competitive terms throughout the whole geographic market. This analysis will include an examination of requirements for a local presence in order to sell in that area the conditions of access to distribution channels, costs associated with setting up a distribution network [...]"*⁷².
- (127) Concerning basic demand characteristics, paragraph 46 of the Notice on the definition of the relevant market states that *"[t]he nature of demand for the relevant product may in itself determine the scope of the geographical market. Factors such as national preferences or preferences for national brands, language, culture and life style, and the need for a local presence have a strong potential to limit the geographic scope of competition"*, while paragraph 48 states that *"an examination of the customers' current geographic pattern of purchases provides useful evidence as to the possible scope of the geographic market"*.
- (128) In addition, *"[t]rade flows, and above all, the rationale behind trade flows provide useful insights and information for the purpose of establishing the scope of the geographic market but are not in themselves conclusive"*⁷³.

⁷¹ Notice on the definition of the relevant market, paragraphs 28, 29 and 30.

⁷² Notice on the definition of the relevant market, paragraph 30.

⁷³ Notice on the definition of the relevant market, paragraph 49.

- (129) Moreover, according to paragraph 50 of the Notice on the definition of the relevant market, *"The absence of trans-border purchases or trade flows, for instance, does not necessarily mean that the market is at most national in scope. Still, barriers isolating the national market have to be identified before it is concluded that the relevant geographic market in such a case is national. Perhaps the clearest obstacle for a customer to divert its orders to other areas is the impact of transport costs and transport restrictions arising from legislation or from the nature of the relevant products"*. The same paragraph also states that: *"access to distribution in a given area, regulatory barriers still existing in certain sectors, quotas and custom tariffs might also constitute barriers isolating a geographic area from the competitive pressure of companies located outside that area"*.
- (130) Paragraph 52 clarifies and concludes that *"[t]he paragraphs above describe the different factors which might be relevant to define markets. This does not imply that in each individual case it will be necessary to obtain evidence and assess each of these factors. Often in practice the evidence provided by a subset of these factors will be sufficient to reach a conclusion, as shown in the past decisional practice of the Commission"*.

6.1.3.2. Geographic definition of the market for the supply of white sugar in previous cases

- (131) In a number of previous decisions⁷⁴, the Commission considered that the relevant geographic market for the supply of sugar was national in scope or even sub-national, at least for Germany.
- (132) In *Südzucker / Saint Louis Sucre*⁷⁵ the Parties claimed that the market for sugar in general should be Union-wide. However, the Commission concluded in line with previous decisions⁷⁶ on a market that is even smaller than national in Germany. The main reason for this was the location of the production sites in Germany. Whereas, for example, in France the production sites were located in the northern and north-eastern parts of the country, the production sites of the different competitors in Germany were located in different parts of Germany. Due to transport costs, longer distances between customers and suppliers played an important role for the final price of the sugar. This resulted in Südzucker having large market shares (over 80 %) in the campaign year 1999/2000, as in the previous years, in Bavaria, Baden-Württemberg, Saarland, Hessen and Rheinland-Pfalz, whereas Nordzucker had comparable market shares in Schleswig-Holstein, Hamburg, Bremen and Niedersachsen and Pfeifer & Langen had comparable market shares in Nordrhein-Westfalen. The market shares were comparable only in Eastern Germany. The Commission also found that this effect was strengthened on the German market due to different market acting strategies of the producers. Most of the customers had confirmed during the market investigation that proximity to the customer is a major factor affecting customer choice. Sugar is only supplied for "free-house-prices" in a certain radius around the production site. Longer distances are not be supplied at all or only for much higher costs.

⁷⁴ Commission Decision 2003/259/EC in Case No COMP/M.2530 - Südzucker / Saint Louis Sucre and Commission Decision of 30 July 1991 in Case No IV.M.062 - Eridania / ISI 30 July 1991.

⁷⁵ Commission Decision 2003/259/EC in Case No COMP/M.2530 - Südzucker / Saint Louis Sucre.

⁷⁶ Commission Decision 1999/210/EC in Case No IV/F-3/33.708 British Sugar plc, paragraph 65; Commission Decision 97/624/EC in Case IV/F-3/M. 34.621 Irish Sugar, paragraph 98.

- (133) In the most recent decision after the 2006 sugar reform, *ABF/Azucarera*⁷⁷, the Parties argued that the relevant geographic market was, at the very least, wider than national, and is increasingly becoming EEA-wide in scope, because the dynamics of competition in the supply of sugar in the EEA have changed following reforms to the Sugar Regime and the anticipated removal of quotas and tariffs on imports from ACP countries and LDCs, together with the elimination of restitution payments for exports to third countries. They submitted that the reforms to the sugar regime have led and will continue to lead, to an intensification of intra-EEA trade with sugar producers increasingly selling across national borders and a significant increase in imports from third countries.
- (134) The Commission reported that on the basis of the market investigation most customers were still sourcing their supply from sugar producers located close-by and only within deficit areas⁷⁸, cross-border sales could be observed. While the Commission ultimately left the market definition open, it also stated expressly that *the results of the market investigation have generally not confirmed this view*⁷⁹, i.e. that the reforms of the sugar regime had led to wider than national markets.
- (135) Some NCAs, including Bundeskartellamt⁸⁰ and the Autorità Garante della Concorrenza e del Mercato⁸¹, have come to the conclusion that the geographic market is national, whilst other NCAs have left the final definition open without an own assessment⁸². The Dirección General de Defensa de la Competencia, although ultimately leaving open the definition of the relevant geographic market, conducted its assessment under different alternative geographic delineations which included national markets as well as the (larger than national) regional market, consisting of Iberia together with France⁸³.
- (136) In Case C5151 – SECI – CO.PRO.B. – Finbieticola / Eridania, the Italian Competition Authority (ICA) considered the geographic market for the production and supply of sugar to be national in scope with respect to Italy, regardless of imports as high as 26% in 2001. The decision was however partially annulled by the Italian High Administrative Court ("Consiglio di Stato") insofar as the commitments attached to the approval decision were concerned.
- (137) In 2005, the ICA readopted the decision in Case C5151. The 2005 decision does not include a separate relevant market definition. However, the ICA concluded that the competitive conditions in the market had not changed since 2001. In particular, the reasons for a very significant increase in the imports between 2001 and 2005 (up to

⁷⁷ Commission Decision of 30 March 2009 in Case No COMP/M.5449 - ABF/Azucarera. This case mainly dealt with the sugar supply in Spain.

⁷⁸ Paragraph 43 of the ABF/Azucarera decision refers to Spain and Italy as "deficit areas", although Italy was not specifically considered in that case.

⁷⁹ Commission Decision of 30 March 2009 in Case No COMP/M.5449 - ABF/Azucarera, paragraph 43.

⁸⁰ Bundeskartellamt, Beschluss *Nordzucker/Danisco* of 17 February 2009.

⁸² The United Kingdom Office of Fair Trading has stated that the regulatory changes affecting the EU sugar market may cause imports to be a stronger competitive constraint in the future (Acquisition of Illovo Sugar Limited by ABF Overseas Limited, OFT decision of 31 July 2006).

⁸³ Case N 07012 Azucarera Ebro/Negocio de azucar de DAI of 22 March 2007.

50%) were not structural in nature and appeared to depend mainly on isolated events such as a crop failure in Italy.

- (138) Further to a request by the parties to review the commitments because of the new competitive conditions in the market, a new decision in the same case was adopted in 2006. In that decision, the ICA did not explicitly depart from its relevant geographic market definition of the sugar market as national. The ICA considered, however, that the change in the European regulation would have been likely to make structural the increase of imports in Italy already noted in the 2005 decision. As a result, the constraints on the merger entity had been modified and the commitments were no longer necessary. The ICA therefore decided to revoke the remedies attached to its conditional decisions of 2002 and 2005.
- (139) Concerning the case *Nordzucker/Danisco*,⁸⁴ which was decided almost four years after the sugar reform, the German Bundeskartellamt concluded that markets were national pointing to continued price differences between Member States. The Bundeskartellamt regarded the German market as national, because (i) there were only small chances of accessing the market, (ii) transport costs were relatively high, (iii) imports were small, (iv) in order to compete in Germany a strong local presence was necessary due to the fact that customers did not have their own storage capacities but were dependent on just-in-time deliveries, (v) there were different national market conditions regarding prices and the market structure on the supply-side in different Member States.
- (140) The Bundeskartellamt stressed that potential importers need to have a strong national presence, including in particular important storage facilities, since industrial food processors require security of supply and flexible adaptation of sugar supplies according to their factories' needs.

6.1.3.3. View of the notifying party

- (141) The notifying party puts forward that the relevant geographic market for the supply of white sugar is at least larger than national if not EEA-wide, since the Commission's decisional practice indicating national geographic markets should be re-assessed, in the light of the intensified intra-Union trade post-2006. In particular, the notifying party points to the quota renuncements that transformed the Union into a net importer of sugar and the abolishment of quantitative restrictions on LDC imports as of 1 October 2009.
- (142) More specifically, the notifying party argues that (i) already today, 50% of the Italian demand is satisfied through imports, and (ii) the fact that customers mention a practice of nationwide contracting and do generally not source directly from abroad does not say anything with respect to the trade flows in the sugar industry.
- (143) Therefore, the notifying party is of the opinion that the relevant geographic market should be EEA-wide. In this regard, the notifying party has submitted that the European sugar market experiences an intensification of the sugar trade flows as (i) regional consumer preferences disappear more and more, (ii) contracts are increasingly based on international tenders for key accounts, since retailers and other

⁸⁴ Bundeskartellamt, Beschluss *Nordzucker/Danisco* of 17 February 2009.

sugar customers increasingly change to European sourcing strategies, and (iii) the new sugar market regime reduced the entry barriers. Concerning in particular the supply of white sugar in Italy, the notifying party points to the fact that the white sugar sold in Italy originates from Austria, Germany, France, but also from the United Kingdom, Spain, the Netherlands, Poland, Serbia, Croatia, ACP/LDC-countries and other third countries.

- (144) Therefore, the notifying party considers that for the assessment of the proposed transaction with respect to the supply of white sugar in Italy the relevant geographic market should include at least southern Europe, including southern Germany and southern France⁸⁵.

6.1.3.4. Assessment

- (145) Despite the sugar reform of 2006 and subsequent market developments in Italy and the EEA, the relevant geographic market for the supply of white sugar to industrial processors in Italy remains national essentially for the following reasons analysed in detail below:

- (1) On the demand side, (i) industrial customers in the vast majority of cases buy from suppliers based in Italy, have national contracts and do not source directly from abroad; (ii) the few large players which do buy transnationally from transeuropean players have to pay "Italian" prices for their purchases; (iii) the vast majority of industrial customers buy nationally, because security and regularity of supply and thus closeness to storage facilities are crucial factors for industrial processors and retailers; and (iv) while customers multisource they rarely switch their main supplier. These demand-side characteristics mean that suppliers who want to compete successfully in the overall market for industrial customers in Italy need to have access to an established customer base, possess a developed distribution and logistics network and have a good knowledge of local and national market conditions, as analysed below under point (2).
- (2) On the supply-side, (i) producers of beet sugar in Italy are constrained by non-tradable fixed production quotas which are set on a national basis; (ii) the large quantity of imports in Italy is the direct consequence of the quota system which limits beet sugar production in Italy and does not as such indicate competitive pressure exercised upon Italian producers by foreign players; (iii) foreign producers operate in Italy mainly through joint ventures with well-established Italian players; this tends to show that the Italian market has characteristics distinct from other markets in Europe, otherwise the big European producers would simply sell directly into Italy and not engage in joint venture agreements which force them to share profits; (iv) in recent years Südzucker's strategy in Italy has been to compete with low prices and thus is markedly different from its strategy in Germany or France where it maintained high prices; in a market wider than national transnational arbitrage would have defeated such separate strategies; (v) internal documents of the Parties indicate national marketing strategies per Member State; (vi) internal documents of the Parties indicate

⁸⁵ Annex 16-1 of Südzucker's reply to the 3rd RFI in Phase II (Form CO Italy, page 10).

sales programs and price-setting at a national level; (vii) market boundaries along national borders are both reflected and reinforced by non-compete clauses based on Italy as reference territory in joint-venture agreements; and (viii) a submission by the Bundeskartellamt also points towards national market definition for Germany, with arguments which are by analogy relevant for the Italian market and coherent with a national definition of the market.

- (3) Price data collected by the Directorate General for Agriculture of the Commission ('DG AGRI') show that (i) during the last years significant price differences between Italy and Germany/France have not been arbitrated away as would be expected to happen in the same geographic market, (ii) Italian market price changes co-move less strongly with its neighbouring and exporting Member States than these neighbouring Member States' price changes co-move amongst each other and (iii) in recent years where Europe experienced scarcity of sugar supply the price differences between Member States actually increased which is incompatible with the claim that the market is increasingly EEA-wide.
- (4) Persistent significant divergences in market shares from one Member State to another, even when those Member States are neighbouring, point towards the continued existence of national markets, since market share differences are not competed away.

(1) DEMAND SIDE CHARACTERISTICS

- (146) According to paragraph 13 of the Notice on the definition of the relevant market, *"from an economic point of view, for the definition of the relevant market, demand substitution constitutes the most immediate and effective disciplinary force on the suppliers of a given product, in particular in relation to their pricing decision"*. More specifically, the Commission will conduct an analysis of the demand characteristics, such as the importance of national or local preferences, current pattern of purchase of customers (paragraph 29 of the Notice).
 - (i) Industrial and retail customers in the vast majority of cases buy from suppliers based in Italy, have national contracts and do not source directly from abroad
- (147) According to paragraph 48 of the Notice on the definition of the relevant market, *"an examination of the customers' current geographic pattern of purchases provides useful evidence as to the possible scope of the geographic market"*.
- (148) In the case at hand, the main part of commercial relationships between customers and suppliers is national. The market investigation revealed that most of the customers purchase on a national level and do not import into Italy (only 4 out of 35 customers buy from abroad). Even some large customers [...] have only national wide contracts. [A large customer]* argued that, because of national contracts, an Italian producer delivers only to Italy⁸⁶ indicating that Italian customers cannot source

⁸⁶ Reply by [...] (replied to question 28) (Confidential and Non-Confidential Versions - Questionnaire to sugar customers in Italy – Phase II).

directly from producers active outside that Member State. Also, [a large customer]*⁸⁷ explains that their contracts are exclusively national.

(ii) The few big players which do buy transnationally have to pay "Italian" prices for their purchases

(149) Only a few very large customers [...] indicate that they have both EEA and national wide contracts while another important customer, [a large customer]* underlines that negotiations take place regionally (cross-border) and the contracts are signed locally⁸⁸. However, even in the few cases where the overall negotiations take place on a wider than national level (regional or EEA), the majority of customers replied that prices are set for each Member State separately, according to the market situation in the Member State of supply. With respect to Italy, the market participants explained that the scarcity of sugar is the most important factor determining the Italian prices they have to pay⁸⁹.

(150) On the basis of the above, it is considered that the market investigation has shown that even in the few cases where contracts were negotiated centrally for several countries, the prices and market characteristics differed between Italy and other countries. Transnational purchases are therefore not able to exercise a meaningful constraint on pricing in Italy.

(151) The existence of national prices in Italy different from prices in other Member States is evidenced in more detail by the analysis in recitals (215) to (250) of this Decision.

(iii) Industrial and retail customers buy nationally because security and regularity of supply and thus closeness to storage facilities are crucial factors for industrial processors and retailers

(152) In the customers' view⁹⁰, the availability of sugar is fundamental for their business. All customers questioned during the second phase market investigation considered that security of supply is a determining factor for their activities with regard to their purchases of sugar in Italy, both in terms of quantity and quality. Apart from other disadvantages of sourcing abroad - such as high transport costs, longer delivery period resulting from long-distance transportation - the need to maximise security of supply and minimise the risk of disruption are essential for their choices regarding the sourcing of sugar. Sugar is an essential product for the food and beverage industries (e.g. producers of biscuits, ice-cream, sweets, soft drinks) as well as for the retailers which cannot be substituted by other products.

(153) This is not contested by the notifying party which agrees that security of supply is one of the main characteristics that industrial customers (in the food and beverage industry) and retailers are seeking from their suppliers. The notifying party has further explained that its own strategy for ensuring security of supply for its customers in sugar deficit countries is based on two pillars: (i) sufficient storage

⁸⁷ Reply by [...] (replied to question 28) (Confidential and Non-Confidential Versions - Questionnaire to sugar customers in Italy – Phase II).

⁸⁸ Questionnaire to sugar customers in Italy – Phase II, question 28.

⁸⁹ See replies to the Follow-up questions to Sugar Customers sent on 17 January 2012.

⁹⁰ Questionnaire to sugar customers in Italy – Phase II.

facilities close to the customers and (ii) sound management decisions about allocation of sales to a specific destination (including stock levels required)⁹¹.

- (154) In order to ensure security of their sugar supplies, customers generally conclude long-term (annual and/or 3-8 months) contracts with suppliers⁹². Furthermore, the vast majority of those contracts are concluded under "Italian" prices and conditions.
- (155) The contractual and established commercial relationships in the different markets also do not allow producers in other Member States to effectively constrain sugar prices in Italy. For example, even the notifying party suggests that there is "*no incentive and/or possibility for Südzucker to redirect sugar supply that is originally destined for other markets to deficit countries such as Italy unless prices in Italy would exceed considerably the price levels in other markets thereby covering the extra logistics costs [...]**⁹³. [...]*⁹⁴.
- (156) Customers also acknowledge the importance of regular deliveries, which may even have to take place on a daily basis. This is even more true for small customers who - in contrast to the notifying party - lack their own storage facilities and are therefore dependent on in time supply of relatively small quantities. Therefore, customers seek suppliers which control storage and distribution sites geographically close to their own facilities in order to minimize the risk of supply disruptions and delays.
- (iv) Low price elasticity of demand confirms dependence of customers on suppliers
- (157) The importance of regular and uninterrupted sugar supplies for industrial processors is further confirmed by the low price elasticity of demand of industrial customers. In an internal document EDFM describes the sugar consumption within the Union as relatively static and thus independent of price fluctuations. In the same document it also states that both the industrial and retail demand is income and price inelastic. "*The total EU-27 sugar consumption is relatively static at around 16.5 million tonnes, and moreover, sugar demand, both industrial demand and retail demand, in the EU is markedly income and price inelastic*"⁹⁵.
- (158) The statement suggests that customers will buy similar quantities of sugar independently of price levels and thus also when prices are very high. It also suggests that customers have limited leverage to negotiate prices below market price levels and that they cannot choose to switch to alternative suppliers.
- (159) In view of the above elements, combined with the customers' need for security of supply, customers have no leverage to deviate from Italian contracts. This element also suggests that there is a national market for Italy.

⁹¹ Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 58, sent by e-mail of 1 December 2011 (19:33).

⁹² Questionnaire to sugar customers in Italy – Phase II.

⁹³ Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 15, sent by e-mail of 1 December 2011 (19:33).

⁹⁴ EDFM's reply to the 6th request for information of 11 October 2011, internal document on "Italian Market" (undated), slide 12.

⁹⁵ European Sugar Logistics Study prepared for the Ethiopian Sugar Development Agency from 16 February 2010, provided by ED&F Man, p.17.

- (v) Many customers who view the market as wider than national base their opinion on the fact that Italy imports sugar.
- (160) In its response to the Statement of Objections the notifying party stated that "*[a]ll competitors and 27 out of 47 customers stated in response to the market testing that they view the relevant geographic market is wider than Italy*".
- (161) A more careful reading of the replies to the market investigation shows however a different and much more nuanced picture.
- (162) With regard to competitors, only 5 out of 10 considered that the market was not confined to Italy but was wider. By contrast 4 out of 10 competitors considered that the relevant geographic market for the supply of sugar was still national while one of the competitors did not answer this question.
- (163) Concerning the customers, out of a total of 50 customers who replied, 25 consider that the market is wider than national, while 25 customers do not consider the market to be wider than national.
- (164) In addition, out of 25 customers considering the market wider than national, 18 justified their answer by pointing towards the large import quantities entering into Italy due to the deficit nature of the Italian sugar market.
- (165) The Notice on the definition of relevant market (paragraph 49) emphasizes in this respect that "*trade flows, and above all, the rationale behind trade flows provide useful insights and information for the purpose of establishing the scope of the geographic market but are not in themselves conclusive*".
- (166) In the case at hand, these large quantities of sugar imports are the direct result of market regulation, that is to say the radical reduction of Italian production quotas after the sugar reform of 2006, which limits Italian internal production and thus has created an important but artificial gap between Italian supply and consumption. Therefore, large quantities of imports of sugar into Italy do not as such illustrate competitive pressure exercised upon Italian producers by foreign players and do not evidence a market wider than the Italian market. The fact that imports result from regulation means that they do not come into the market as a response to relatively higher prices but to an artificially created gap.
- (167) Thus, the 18 customers, concluding that the market was wider than national on the basis of significant imports, did not take into account that the rationale for the imports was not well-functioning cross-border competition, but an output restriction in Italy imposed by regulation.
- (168) Of the remaining 7 customers who stated that the market is wider than national, 6 stated that they purchase sugar exclusively on a national basis and do not purchase sugar directly from abroad.
- (169) Accordingly, (i) around half of the competitors and customers consider that the market is national and (ii) a significant proportion of the other half's replies have to be read bearing in mind that they did not take into account the regulatory rationale of the large amounts of imports and/or did not themselves engage in any cross border sales.

- (vi) Customers have not switched to non-Italian suppliers in the recent past despite significant price increases
- (170) Even if a majority of contacted customers stated that in the case of a price increase of 5% to 10%, they would consider buying sugar directly from abroad, such replies need to be read in the light of the replies which the same customers gave to other questions and in particular those concerning their actual market behaviour.
- (171) Only about 4 of 35 end customers which replied to the questionnaire seem to buy directly from abroad⁹⁶. Therefore, the prevailing pattern for end-customers is to purchase through national (Italian) sales offices, thus under Italian prices and conditions.
- (172) Those 4 exceptional customers are particularly large and sophisticated multinationals [...] and cannot serve as a proxy for the average industrial sugar customer in Italy.
- (173) In addition, even within that group of 4 customers, at least 2 of them stated that for such purchases prices were different between Member States and that such price differences apply in particular for Italy. Therefore, even the sugar supply contracts of those 2 customers reflect the different pricing patterns in the Member States, which points towards national markets.
- (174) In addition, as stated in paragraph 47 of the Notice on the definition of the relevant market, where appropriate the views of customers on the boundaries of the geographic market, as well as most of the factual information it requires to reach a conclusion on the scope of the market, have to be sufficiently backed by factual evidence. Furthermore, as evidenced by paragraph 38 of the Notice on the definition of the relevant market "*in certain cases, it is possible to analyse evidence relating to recent past events or shocks in the market that offer actual examples of substitution between two products (...) if there have been changes in relative prices in the past (all else being equal), the reactions in terms of quantities demanded will be determinant in establishing substitutability*".
- (175) Therefore, taking this into account, the actual behaviour of the customers in the past under comparable market conditions as outlined in the questionnaire⁹⁷ becomes as important as their opinion as to how they would react under the outlined conditions. The conditions outlined in the questionnaire were a significant price increase in Italy. While this very same situation actually took place in the last years in Italy, a vast majority of the customers, as indicated above, did not actually start sourcing sugar from abroad.
- (176) Furthermore, according to all customers, responding to the questionnaire⁹⁸, in the last five years and despite recent significant price increases in Italy which were much

⁹⁶ Questionnaire to sugar customers in Italy – Phase II, question 22. Three end-customers were not included for calculating the previous percentage of 15% referred to in the Statement of Objections. The total responding customers are in fact 35, the 3 additional ones not sourcing from abroad.

⁹⁷ Questionnaire to sugar customers in Italy – Phase II.

⁹⁸ Questionnaire to sugar customers in Italy – Phase II.

higher than 5% to 10 %, no customer responded by purchasing sugar directly from abroad in the last 5 years⁹⁹.

- (177) The above considerations support the conclusion that (i) the prices are set at the Member State level for the Italian market, and (ii) customers cannot/do not source directly from abroad even when they are faced with significant price rises.

(2) SUPPLY SIDE PERSPECTIVE

(i) Production quotas are still national and non-tradable

- (178) In its reply to the Statement of Objections, the notifying party has argued that the Commission should not rely on its previous decision-practice due to the fact that all previous decisions deal with the situation prior to the sugar reform or still influenced by the previous regime¹⁰⁰. In support of its argument, Südzucker points to paragraph 32 of the Notice on the definition of the relevant market, which states that "*the Commission also takes into account the continuing process of market integration*" when defining geographic markets.
- (179) The continuing process of market integration has been taken into account in this Decision. Nevertheless, paragraph 32 of the Notice on the definition of the relevant market does not necessarily mean that the Commission will define markets as Union-wide or EEA-wide for each product which is covered by internal market legislation. The Commission analyses, on the basis of the facts in every individual case, to what extent the process of market integration has actually led to Union-wide or larger than national markets.
- (180) As regards the sugar regime following the 2006 reform, the Court of Auditors in its 2010 report¹⁰¹ found that the currently applicable sugar regime had similar consequences as the regime in force before 2006, namely limited possibilities of transferability of quotas and rigidity of production capacity. The Court of Auditors stressed that: "*The Court's previous special report on the sugar CMO) drew attention to the rigidities linked to the quotas system and concluded that 'national quotas have prevented production moving to the most efficient areas', 'normal competitive forces do not operate and in several cases sugar companies have been fined for abuses of competition' and stated that the existence of barriers to entry for new sugar beet growers warranted consideration by the Commission. In this regard a 2004 Commission Communication initially proposed a sugar sector reform based on a uniform cut in quotas and intended to foster quotas transferability between producers in the EU. However, this proposal was not adopted because a majority of Member States opposed the idea of intra-Community quota transfers. In terms of sugar industry processing efficiency, the maintenance of rigidities and constraints incorporated into the current quota system, i.e. such as the establishment of quantitative quotas per individual grower in certain Member States, the absence of tradability of quotas and the limited possibilities for their transferability, results in undue rigidity of production capacity and reduces scope for both growers and*

⁹⁹ Questionnaire to sugar customers in Italy – Phase II, question 38(e).

¹⁰⁰ Südzucker's reply to the Statement of Objections, para. 32.

¹⁰¹ Special report n°6 from the European Court of Auditors – "Has the reform of the sugar market achieved its main objectives?" – 2010.

producers to increase efficiency. The audit confirmed that in some of the audited Member States, quota restrictions hamper the entry of possible new growers and delivery rights of existing growers may not be changed without their consent. This entails significant constraints in the sugar production market."

(181) In this context, the 2001 Commission reasoning in *Südzucker/Saint Louis Sucre*¹⁰² stating that *"the existence of an EU-wide regulation for a certain economic branch would not necessarily lead to an EU-wide market but rather, on the contrary, prevent an EU-wide market due to national quota"* is still valid under the current regime.

(182) Therefore, the reform of 2006 did not change one of the main rigidifying factors why sugar markets are still national, namely the attribution of quotas on a national basis to established national players without possibility to trade quotas.

(ii) Imports do not imply a wider than national market

(183) According to paragraph 49 of the Notice on the definition of the relevant market *"trade flows, and above all, the rationale behind trade flows provide useful insights and information for the purpose of establishing the scope of the geographic market but are not in themselves conclusive"*.

(184) In addition, paragraph 50 of the Notice on the definition of the relevant market states: *"The absence of trans-border purchases or trade flows, for instance, does not necessarily mean that the market is at most national in scope. Still, barriers isolating the national market have to [be] identified before it is concluded that the relevant geographic market in such a case is national [...]** access to distribution in a given area, regulatory barriers still existing in certain sectors, quotas and custom tariffs might also constitute barriers isolating a geographic area from the competitive pressure of companies located outside that area".

(185) It follows that although trade flows often provide useful insights and information for the purpose of establishing the scope of the geographic market, under paragraph 49 of the Notice on the definition of the relevant market, they are not in themselves conclusive and it is necessary to look carefully at their *rationale*, as well as at other elements.

(186) As discussed above, in the present case the existence of large imports as such does not indicate a larger than national market, because the need for such a large amount of imports is a direct consequence of the significant reduction of Italian production quotas after the sugar reform of 2006, which limits beet sugar output in Italy and thus has created an important gap between supply and demand in Italy which can only be filled by imports.

(187) Moreover, the nature of the imports in question needs to be taken into account¹⁰³. The market investigation has shown that the vast majority of these imports are intra company supplies by the big northern European players [...]*

to their Italian sales joint ventures or organisation¹⁰⁴. By contrast there seems to be hardly any direct

¹⁰² Case COMP/M. 2530 – *Südzucker / Saint Louis Sucre* of 20 December 2001, para. 34.

¹⁰³ See paragraph 49 of the Notice on the Definition of the Relevant Market.

¹⁰⁴ Questionnaire to sugar competitors – Phase I & Phase II.

imports from players active outside Italy directly to customers in Italy. Such intra company imports do not exercise any direct competitive pressure on the big suppliers active in Italy.

- (188) Thirdly, it is important to bear in mind that the prevailing pattern for large scale sugar operations of northern European sugar producers in Italy remains that of a joint venture between an Italian and a foreign player (e.g. Südzucker with MAXI, Pfeiffer & Langen with COPROB, Cristal Union with Eridania and in a certain way EDFM with SFIR). This shows first of all that Italian producers limited in their output by the quota system need to co-operate with foreign producers in order be able to supply the necessary quantities in the Italian market. Furthermore and more importantly, it also shows the lack of direct competitive pressure exercised by sugar producers with no established presence in Italy on prices in Italy. If it were easy to react to high prices in Italy with direct imports, then foreign producers would have no reason to engage into joint ventures with Italian players and share profits with the Italian joint venture partner. In fact, the profit-sharing of the joint venture structures is the "price" that foreign players have to pay because it is not easy for them to establish themselves during a short period of time as independent competitors in Italy on their own.
- (189) Fourthly, while Tereos is [Description of Tereos' market strategy]*, its case also shows that there is no direct pressure from imports leading to price arbitrage between the rest of Europe and Italy. Tereos entered the Italian market in 2005/2006, at a moment when the sugar reform led to a particularly large sugar deficit in Italy and other foreign players were only starting to enter the market through joint ventures with Italian players. [...]*. Moreover, Tereos [Description of Tereos' market strategy]*.
- (190) In line with the above [a large Italian sugar producer]* describes Tereos as a player on the Italian white sugar market with very good access to input, no infrastructure in Italy, very light national sales office, non-existent regional sales office, no partnership on the Italian white sugar market¹⁰⁵, poor customer relationship¹⁰⁶ and in addition without ability to expand its sugar output¹⁰⁷.
- (191) In view of the above, the quantities of the imports of white sugar to Italy by other Member States do not point towards a wider than national geographic market. Rather, the nature of those imports actually militates in favour of a national definition of the market.
- (iii) Foreign producers operate in Italy through joint ventures with Italian players
- (192) The Notice on the definition of the relevant market states that the Commission analysis on supply factors will include "*an examination of requirements for a local*

¹⁰⁵ Reply by [...]* ([...]* (reply to question 58) (Non-Confidential Version – Questionnaire to sugar suppliers / producers Italy – Phase II).

¹⁰⁶ Reply by [...]* ([...]* (reply to question 69) (Non-Confidential Version – Questionnaire to sugar suppliers / producers Italy – Phase II).

¹⁰⁷ Reply by [...]* ([...]* (reply to question 59) (Non-Confidential Version – Questionnaire to sugar suppliers / producers Italy – Phase II).

*presence in order to sell in that area the conditions of access to distribution channels, costs associated with setting up a distribution network [...]**¹⁰⁸.

- (193) The need for security of supply pushes Italian customers towards a strong preference for local suppliers. For example, internal documents of Südzucker show that "*Italian customers appreciate national partners more than customers of other countries*"¹⁰⁹. This leads to the necessity for foreign suppliers to establish partnerships with local players in Italy.
- (194) The notifying party itself argued that prior to its acquisition of MAXI, [...]*. Those statements stress the necessity for a foreign producer to establish a partnership with a player already active in Italy in order to be an effective competitor.
- (195) The other non-Italian players also had to team up with well-known Italian players in order to enter the Italian market in a large-scale:
- (a) the German sugar manufacturer Pfeifer & Langen has acquired 49.9% of the sales subsidiary of COPROB/Italia Zuccheri;
 - (b) the British sugar manufacturer Tate & Lyle had established a joint-venture with Eridania for the marketing and sales of all their sugar products. In the course of 2011, Tate & Lyle left the Italian market, [...]*
 - (c) subsequently the French sugar manufacturer Cristal Union via CristalCo had to step in and replaced Tate & Lyle in the joint-venture with Eridania; and
 - (d) EDFM has built a new refinery through a joint-venture with SFIR in the South of Italy (Brindisi - SRB).
- (196) Although the French sugar manufacturer Tereos is [Description of Tereos' market strategy]*, this does not break the pattern of joint-venture entry, because: (i) Tereos' entry took place in 2006, thus very early in the reform at a period when producers still disposed significant volumes of sugar; and (ii) Tereos' market share in Italy [...]* over the past years and is [...]* that of other foreign players, such as Südzucker who teamed up with MAXI the same year and increased significantly its presence over the last 5 years.
- (197) Therefore the prevailing pattern for foreign producers' operations in Italy is through joint ventures with Italian players or at the very least through a national sales organisation.
- (iv) Südzucker's pricing strategy [...]*
- (198) [...]*
- (199) During the oral hearing the Parties submitted a graph¹¹⁰, which was meant to show a convergence of prices between Germany, France and Italy. However, first of all, the prices shown are Südzucker prices only and it is not clear whether they correspond to

¹⁰⁸ Commission Notice on the definition of the relevant market, paragraph 30.

¹⁰⁹ Annex 23 of Südzucker's answer to the 2nd RFI in Phase I, at page 13.

¹¹⁰ Slide 13 of Südzucker's presentation in the hearing of 5 March 2012.

market prices. Secondly, the alleged convergence in 2011/2012 appears to be mainly driven by the forecasted data inserted for 2011/2012 on the basis of 'contracted prices' instead of 'invoiced prices'¹¹¹. The Commission is of the view that the data from DG AGRI used in the Commission's analysis below offers a more reliable view on price differences between Member States.

- (200) However, even assuming that some conclusion can be drawn from the price figures given for the years 2006 to 2011¹¹², those price figures would actually confirm significant price differences between Member States which cannot be explained by transport costs. According to the graph in question from campaign year 2006/2007 to 2008/2009, price differences between [...] are in the range of EUR [...] and between [...] in the range of EUR [...]. In campaign year 2009/2010, price differences between [...] are in the range of EUR [...] and between [...] in the range of EUR [...]. Even in campaign year 2010/2011, price differences between [...] are in the range of EUR [...].
- (201) These price differences are higher than the transport costs between those Member States. If those Member States belonged to the same geographic market, these price differences would not exist since arbitrage would equalise prices through sales of low-priced Italian white sugar to high-priced Germany and France.
- (202) Furthermore, statements by competitors indicate that the conditions of competition are substantially different in the (more competitive) Italian market than in Germany or France. For example, [a large sugar producer]* stated that *"MAXI, Südzucker's distributor in Italy, may have managed to deter potential entrants by significantly reducing its prices during the last 3 to 4 years in Italy. It appears that Südzucker via MAXI were selling at lower prices in Italy than in surplus markets in the last few years. Normally, the market price in Italy should reflect the high transport costs involved when sugar is imported into the Italian market from France, Germany and the United Kingdom. However, MAXI's prices in Italy during the last couple of years were lower than the ones in the abovementioned countries."*¹¹³. In addition, [a large Italian sugar producer]* stated: *"Tate & Lyle had not enough raw sugar to supply their refineries. Nordzucker concentrated its commercial action in North of Europe, given the fixed quantity at their disposal and the low level of pricing in Italy not sufficient to cover logistic costs to arrive in Italy. However, we can assume that the dumping were made in that period by Südzucker was aimed to discourage the competitors to play in Italy"*¹¹⁴.

(v) Internal documents of the Parties indicate national strategies

- (203) Internal documents of the Parties show that they develop their strategies on [...].
- (204) Südzucker's internal documents show that it monitors the production and prices for sugar [...]. For example, Südzucker's presentation for the acquisition of MAXI

¹¹¹ See recitals (246) to (249) of this Decision which explain in more detail why the data are not reliable.

- (214) The Bundeskartellamt's letter is, inter alia, based on a [...] ¹²⁶. This shows that Südzucker is likely to be capable of segmenting the market in Italy and Germany along national lines.

(3) WHITE SUGAR PRICE DIVERGENCES BETWEEN THE DIFFERENT MEMBER STATES

DG AGRI data points towards the existence of national markets

(i) DG AGRI data description

- (215) In order to verify the boundaries of the geographic market the Commission has also analysed a database collected by DG AGRI on monthly Member State price data for the period April 2008 to November 2011, as well as aggregate price data at Union level for the period June 2006 to October 2011.
- (216) Union beet producers submit their ex-works prices and quantities sold every month and DG AGRI computes (i) the weighted Union and national average price levels for sugar and (ii) the standard deviations, a measure of price dispersion, thereof (i.e. in the database DG AGRI computes the standard deviation both within a given Member State and also across the Union). Data on average price levels and standard deviation at the Union level, but not at Member State level, are publicly available.
- (217) There are some general clarifications on what is included in the data collected by DG AGRI. First, the pricing data are collected from beet producers while pricing information from raw cane refiners are not included in the database. This issue however should not be material to the analysis as prices of white sugar produced either from beet or from raw cane sugar should be very similar within the same geographic market ¹²⁷. Second, the pricing data provided by beet producers refer to homogeneous granulated crystal, standard quality, in bulk or big bags and in particular exclude bag for retailers ¹²⁸. Therefore, as the data collected specify the quality of sugar they are comparable across Member States.

¹²⁵ Letter from the BKA dated 07.10.2011 addressed to [Commission official].

¹²⁶ "[...] * Danach respektieren Nordzucker und Südzucker ihre jeweiligen Vertriebsgebiete in Deutschland. Dies hat schon in der Vergangenheit zu Preissteigerungen und zur Zurückhaltung von Zuckermengen geführt. Wesentliche Abnehmer von Industriezucker haben vorgetragen, trotz wiederholter Nachfrage kein Angebot von anderen Zuckerproduzenten als dem Stammlieferanten zu erhalten. Quotenzucker [...] * wird offenbar unter Inkaufnahme hoher Transportkosten in Defizitgebiete, insbesondere Italien, exportiert. Dadurch konnte ein vergleichsweise hohes Preisniveau für Verarbeitungszucker in Deutschland etabliert und aufrecht erhalten werden. Diese Probleme haben sich im Jahr 2011 nach den Marktrecherchen des "Infozentrum Zuckerverwender" als einer Interessenvertretung der Industriekunden, weiter verschärft." [Letter from the BKA from 07.10.2011 p. 2-3]

¹²⁷ White sugar produced either from beet or from raw cane is entirely substitutable as shown by the replies in Questionnaires to Competitors in Phase I.

¹²⁸ See price reporting system regulation (EC) No 1234/2007, Article 9, update: March 2011.

(ii) Price evolution

Figure 1: Union average price

- (218) DG AGRI computes the Union average prices based on those Member State data. As shown in Figure 1, the Union average price has decreased until 2010 but since then the average Union price for white sugar has increased substantially, despite the decrease in the reference price introduced by the 2009 reform. DG AGRI also computes the evolution of the weighted standard deviations across the Union¹²⁹. Those data show that while price dispersion has remained relatively stable up to the end of 2010, it has increased significantly during 2011. This finding is likely to illustrate that the variation of sugar prices in the Union has increased during 2011, instead of converging.

¹²⁹ Computing the weighted average standard deviation across Member States yields a very similar pattern.

Figure 2: Union standard deviation weighted by quantities

- (219) These aggregate level trends are also evident at the Member State level. In particular, while prices in different Member States follow similar overall patterns, the differences across Member States in levels have been increasing, especially during 2011, as shown in the following graphs of Member States prices and within Member State standard deviation¹³⁰.

¹³⁰ Due to the confidentiality of the Member State data collected by DG AGRI there are no labels provided for the different Member States prices and standard deviations. The countries shown in the graphs are Austria, Belgium, Bulgaria, Czech Republic, Denmark, Germany, Spain, Finland, France, United Kingdom, Greece, Hungary, Italy, Lithuania, Netherlands, Poland, Portugal, Romania, Sweden and Slovakia.

Figure 3: Member States prices

Figure 4: Member States prices - Standard Deviations

- (220) Focusing on the Italian market, two patterns at the end of the period under consideration appear. First, the prices in Italy have risen relatively more than in other main Union markets, such as Germany and France (see Figure 5 on relative prices of Germany and France compared to Italy). The prices in Italy have risen from levels that were below German and French prices, by around 8%, in the second quarter of 2011 to more than 15% higher in the third quarter of 2011. Secondly, during 2011

the variability observed within Italy is much greater than the variability in the two large surplus Member States, Germany and France (the standard deviation in the Italian market even reached above EUR 100 in 2011). This finding implies that price differences well in excess of 15% (but also well below 15%) were observed between Italy and France and Italy and Germany¹³¹.

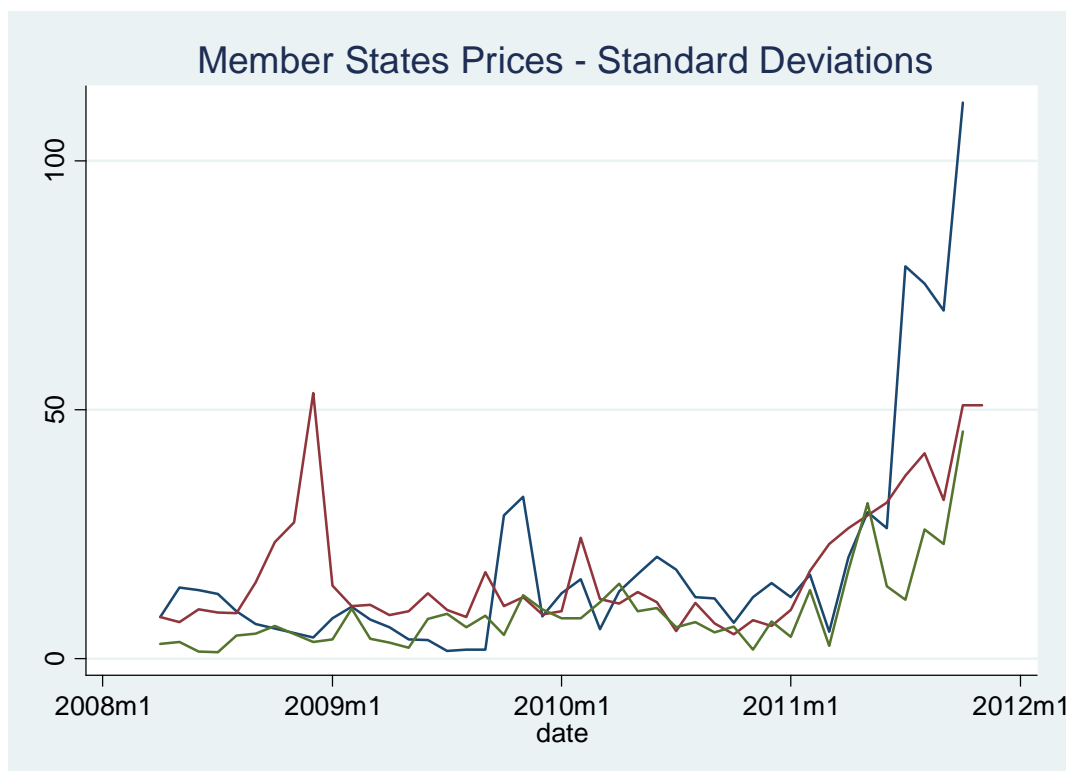

- (221) In the presence of one geographic market, however, one would expect that prices for a homogeneous product do not diverge significantly from each other as arbitrage opportunities will "correct" any pricing difference (and any divergence would only reflect differences in transportation costs). The two figures however suggest that the German and French markets are not likely to be in a position to constrain, at least to a significant level, the increase in the variability observed in the Italian market, in a period where Italian prices have increased significantly compared to the German and French levels.
- (222) In summary, the price dispersion across Member States goes up as the Union price level goes up (during 2011 when sugar becomes scarce overall). As regards Italy, the price level as well as the price dispersion within Italy goes up by relatively more than in its neighbouring Member States. This suggests that price differences are not arbitrated away as should be expected to happen in the same geographic market.

Figure 5: Member States relative prices – Italy

¹³¹ The swings in the relative prices of Italy vs Germany and Italy vs France, as depicted in Figure 5, shows that prices in Italy can diverge from German and French prices.

Figure 6: Member States prices Standard Deviations - Italy

(223) Overall, as far as Italy is concerned, the above Figures of the pricing data collected by DG AGRI are consistent with the qualitative evidence that does not support the definition of a supra-national geographic market.

(iii) Correlation analysis

(224) A correlation analysis on the Member States price series has also been performed in order to explore the pricing patterns across Member States further. Price correlation analysis is based on the idea that in the absence of common (demand or supply side) shocks the extent of co-movement in the prices of different Member States will provide information about the substitutability amongst them. This is because price competition results in an alignment of prices in the two Member States if they belong to the same relevant market¹³². Hence, if two Member States are considered to be part

¹³² For example for two Member States that were to belong to the same market, if a *country specific* cost shock (such as labour costs) were to lead to a price rise in Member State *i*, then consumers would substitute their purchases away from this Member State and purchase instead from Member State *j*. As a result of the increase of the demand in Member State *j* the price in this Member State should increase and so a co-movement (measured by a positive correlation) between the changes in the prices in the two Member States is expected. The Commission acknowledges that price correlation analysis is not a perfect measure for the purposes of market definition and the results of this analysis should be interpreted with caution and in parallel with the pricing evolution and the qualitative evidence collected during the market investigation. A main caveat of correlation analysis is that common shocks (such as fuel costs) can induce spurious correlation and therefore high correlations could be driven by factors which can cause a co-movement but are still unrelated to consumer/producer substitution. Similarly, two price series may be found to be correlated only because each of them has a trend (again, leading to spurious correlation). To address these concerns, correlation analysis is performed on stationary series, i.e. series with constant mean and variance. A series is non stationary if it fails to satisfy any part of this

of the same geographic market then the price movements should be correlated. If the prices of the two geographic areas move perfectly in line with each other, the correlation coefficient is equal to one and if there is no relationship the correlation is equal to zero.

- (225) To assess whether the prices are sufficiently correlated, as one of the elements to consider the two geographic areas to belong to the same market, it is typical to use as a benchmark some other correlations (for which one has strong indications on whether they belong to the same market or not). Therefore, the most useful source of information from this correlation analysis comes from a comparison of correlations among different pairs. For the purpose of this Decision, correlation analysis has been carried out on price changes amongst Member States.
- (226) The results of the correlation analysis are provided in Annex I. The results show that price correlations between Italy and its "neighbouring" and main exporting Member States (notably France and Germany)¹³³ are significantly lower than amongst these Member States, suggesting that the Italian market is more isolated. Therefore, the significant imports from Germany and France to Italy have not led to higher correlation between the price changes in Italy and each of those Member States than between the changes in prices amongst Germany and France¹³⁴.
- (227) Price correlation analysis measures the contemporaneous adjustments in the price changes¹³⁵. The comparative results mentioned above are relatively robust when we consider a (moving average correlation) specification of the tests that captures adjustments in the price changes over a three month period¹³⁶.

definition. In the current case it is found that the Member State price series in levels are non stationary and therefore correlation analysis on the levels is not meaningful. Taking the first difference of the price series though yields stationary series and therefore correlation analysis was conducted on first differences. The economic interpretation when calculating correlations in differences measures whether the price changes rather than price levels would be potentially correlated or not (and therefore the interpretation would be of relative convergence). A high correlation indicates that price changes co-vary.

¹³³ The correlation coefficient between Italy and Austria is higher than Italy and Italy's other "neighbouring countries" but still lower than other pairs of "neighbouring countries", in particular of the main exporting Member States (i.e. Germany and France).

¹³⁴ The Commission has also tested whether the differences in the correlation coefficients are statistically significant following the *cortesti* command in Stata. These tests show that the correlation coefficients between Italy-Germany and Italy-France are significantly smaller (even at the 1 percent significance level) than the correlation coefficient between Germany-France.

¹³⁵ Annex I of this Decision provides the correlation results for a quarterly moving average. Even though the correlations between Italy and its neighbouring/exporting Member States are in most instances higher than the simultaneous correlation they are still relatively lower than the correlations amongst these neighbouring Member States (notably France and Germany). Furthermore, the correlation coefficients between Italy-Germany and Italy-France are found to be statistically significantly smaller (the former at the 5 percent and the latter at the 1 percent) than the correlation coefficient between Germany-France.

¹³⁶ Furthermore, the Commission notes that much larger movements in prices were recorded during the 2010/2011 campaign compared to previous campaigns, largely due to the regime change and the general shortage of white sugar in the market (as evidenced by the market investigation). These larger shifts in prices would be an interesting source of variation for the purposes of price correlation analysis. However, even if the correlations for this subsample for Italy and its "neighbouring countries" are relatively lower than correlations between other "neighbouring countries", the time period is particularly short to draw any meaningful estimates on correlations for this specific subsample.

- (228) Overall, it is concluded that the correlation analysis is consistent with the qualitative evidence collected during the market investigation showing that the Italian market price changes co-move less strongly with its neighbouring and exporting Member States than those neighbouring Member States' price changes co-move amongst each other.

White sugar price divergences between Italian and world price

- (229) The notifying party also claims that the Italian market adheres to world price market conditions. It claims that any increase in market prices in Italy is simply the consequence of increasing world market prices and not capable of being influenced materially by Südzucker. However, the notifying party has not provided evidence to this effect. On the contrary, the evolution of future contracts for white sugar and raw cane sugar (measured by the London #5 and New York #11 futures respectively) and the Italian price do not follow each other closely, as shown in Figure 7.

Figure 7: Italian sugar prices and futures prices

The concerns raised by the notifying party on the comparability of the DG AGRI data are either incorrect or do not affect the main conclusions of the analysis

- (230) The notifying party has raised several arguments on the comparability of the DG AGRI data (see paragraphs 76 to 90 of the reply to the Statement of Objections). The arguments can be grouped into three groups.
- (231) First, the notifying party raises concerns on the usefulness of the analysis and the data due to the differing product mix and the differing contract duration across

Member States. It suggests that "any nationwide analysis of prices also had to include the mix between bulk and retail sugar in that country"¹³⁷. However, as explained above and as acknowledged by the Parties during the Oral Hearing, the DG AGRI data exclude retail sugar and therefore that argument is not relevant for those data. The notifying party also alleges the differing contract duration across Member States to bias the comparability of the data. However, it argues that its contracts are usually shorter in Italy for the retail segment and in Eastern European countries¹³⁸. As retail prices are not included in the data, the price evolution and price correlation analysis is at least valid for all non-Eastern European countries and thus the main findings that compare Italy with France and Germany remain unaffected¹³⁹. Besides, and for sake of completeness, Figures 8 and 9 representing Member States prices and standard deviations excluding Eastern European countries show that the main findings based on Figures 3 and 4 that include all Member States still apply. The Parties contest the similarity of the graphs and claim that "it is unclear for the Parties how these deviations can be explained"¹⁴⁰. The Commission notes that the only difference between the two sets of graphs is the exclusion of the Eastern European Member States. Also the graphs show an increase in the price level differences across Member States and an increase in the Member State standard deviations.

Figure 8 : Member States prices excluding Eastern Europe

¹³⁷ See reply to the SO, paragraph 87.

¹³⁸ See reply to the SO, paragraph 79.

¹³⁹ The possibility of different contract durations in different Member States is also addressed by the robustness check of moving average correlation analysis. A moving average analysis relaxes the assumption of contemporaneous price correlation but captures also price adjustments with a lag.

¹⁴⁰ Reply to the Letter of Facts, paragraph 31.

Figure 9: Member States standard deviation excluding Eastern Europe

- (232) Second, the notifying party claims that "reported prices relate to ex-factory prices causes any price analysis to be strongly biased in the sense that large exports from e.g. France and Germany to Italy will not be reflected adequately in the reported prices. i.e. amounts and prices of sugar exported to Italy are included in the German average price and the Italian average price is calculated only on the basis of local Italian production which represents much less than 50% of the market"¹⁴¹. The Commission understands this argument to acknowledge that different ex works prices (i.e. prices that exclude any transport cost) are set for different Member States for a given factory. This would imply that the "law of one price"¹⁴² would not hold and a country specific "margin" (unrelated to transport costs) would be set.
- (233) Otherwise, namely if ex works prices are the same irrespective of the destination country then this bias cannot be present in the dataset and therefore the analysis above is not affected in any way. Under the assumption that ex works prices depend on the destination country, the Commission notes the following:
- (1) Given that the notifying party does not put forward that the geographic market for Italy is narrower than national, nor does it result from the market investigation, it is not obvious why the price of factories located in Italy would not be representative of the average Italian prices. Imports into Italy would need to compete with Italian producers (therefore no bias would be present in the data for importing countries, such as Italy).

¹⁴¹ Reply to the SO, paragraph 78.

¹⁴² The Law of one price suggests that all identical products should have only one price.

- (2) The Commission is aware of the German data in the DG AGRI data also comprises ex works prices of German exports to Italy. Indeed, the ex works average prices for exporting Member States are calculated on the basis of data that also include the price of exports from that Member State in other Member States. The exporting structure (as well as the share of exports compared to production sold domestically) is important to understand the impact that the method used to calculate prices may have on exporting countries' prices, as computed in the DG AGRI dataset and on the resulting correlation analysis. For this purpose, the Commission has consulted the Comext database collected by Eurostat on intra-Union white sugar flows¹⁴³. During the period of correlation analysis, from April 2008 to November 2011, the sugar exports from Germany to Italy have been consistently between 43-51% of the German exports and therefore represent the vast majority thereof. As these German exports to Italy are part of the German ex works price, the estimated correlation coefficient for Italy-Germany would be higher than the correlation coefficient of Italy-Germany that would result if the prices of these German exports were instead allocated to Italy. Conversely, if German data did not contain the prices of these exports, the correlation between Italy-Germany would be lower than the estimated correlation¹⁴⁴. Hence, the impact of the effect that the notifying party alleges leads to lower correlation between Germany and Italy which therefore suggests that Italian prices are likely to be even more isolated compared to Germany and, similarly, to other exporting Member States. This would therefore be an element militating not against but, to the contrary, in favour of the national dimension of the market for the supply of white sugar to industrial processors in Italy.
- (234) The third argument raised by the notifying party suggests that "*the price correlation between Italy and Germany resp. France has been significantly affected by the explained special events*"¹⁴⁵ such as the unlimited access of sugar from LDC/ACP countries in October 2009 and the temporary low price level in Italy immediately after the reform in 2006. The Commission, however, notes that the correlation analysis performed was based on the first difference of the series. As a result the effect of common shocks, such as EEA wide regulation, would be accounted for in the Commission's correlation analysis.
- (235) The notifying party provided supplementary comments following the Oral Hearing. In this submission the notifying party claims that the price variation analysis is flawed for three reasons which are discussed and dismissed in turn¹⁴⁶.
- (236) First, the notifying party considers that the time intervals chosen for correlation/price evolution/dispersion analyses yields irrelevant results. The Commission does not accept that the extraordinary economic situations, as described by the notifying party,

¹⁴³ The data refer to codes 1701 99 10 and 90.

¹⁴⁴ As to the question whether the relative high correlation between France and Germany is driven by a similar exporting structure, the Commission notes that this is not the case. Indeed, the trade flows suggest a markedly different exporting structure between the two Member States as shown in Appendix 3.

¹⁴⁵ Reply to the SO, paragraph 90.

¹⁴⁶ Südzucker Supplement Comments following Oral Hearing, 12 March 2012. The Parties have repeated the same concerns in their Reply to the Letter of Facts, paras 24 to 30 without providing any further explanations.

imply that prices in this time interval cannot provide useful insights. The explanation provided by the notifying party for persistent differences in prices across Member States may provide the reasons for such movements, however, to the Commission's view they confirm that prices in different Member States do not move closely together.

- (237) The notifying party admits that due to higher stock levels at the beginning of the transition significant quantities had to be redirected and made "*the sugar producers compete aggressively for customers in Italy. Strong price competition resulted temporarily in attractive offers for Italian customers compared to existing customers in neighbouring countries*"¹⁴⁷. The Commission considers that this explanation cannot be reconciled with one EEA-wide geographic market, especially in the light of the fact that those price differences lasted for several years. On the contrary, the fact that the German and French prices were shielded from the alleged very low prices in Italy is an indication that there is no arbitrage between Italy and these Member States. This is also confirmed by the results of the price correlation analysis which shows that the arbitrage between Italy and its neighbouring/exporting Member States is lower than amongst these Member States. The presence of asymmetric shocks (such as the reduction in Italian domestic quota) does not render price correlation analysis irrelevant but on the contrary such shocks provide useful source of information for detecting whether two Member States belong to the same market (i.e whether prices adjust through arbitrage). The Commission also notes that the starting period of the analysis is April 2008 well after the start of the post 2006 regime¹⁴⁸.
- (238) Second, the notifying party claims that the inclusion of ex-works prices for exports from Germany/France into Italy in Italian ex-works prices would lead to lower price differences and higher price correlation. The Commission accepts the notifying party's point that the ex-work prices in Italy would normally be lower than what is reported in the DG AGRI data as it is likely that the ex-works prices of the exports from Germany/France into Italy have to incur higher transport costs than Italian domestic production (and since the final price of sales in Italy should be similar to the ex-works prices of the exports from Germany/France into Italy would be lower)¹⁴⁹. However, this argument does not affect the results of the analysis. Even if the level of Italian ex-works prices would be somewhat lower than indicated in the DG AGRI data, the evolution of the adjusted ex works prices would be identical to the one observed in the dataset (in particular as in the period under consideration the distribution of imports per Member State into Italy are rather stable). The only effect would be a horizontal shift of the Italian prices series downwards to reflect the lower ex work prices for the quantities sold from Germany to Italy. The relative prices (Figure 5) would also fall by the same amount, however the relative swings in the prices would remain and the Italian prices would have increased the most during the last period compared to French and German prices (and as a result there would not be lower price differences as the notifying party suggests).

¹⁴⁷ Supplementary Comments following Oral Hearing, p2.

¹⁴⁸ The Commission also notes the fact that intervention stocks were sold in Italy is not relevant. Besides, the sale of this intervention stocks was sold through EEA tenders.

¹⁴⁹ The Commission notes that exporters from Germany and France may often have to incur transport costs of EUR 30-40 to sell in northern Italy.

- (239) The correlation analysis would also largely remain unaffected. As the correlation analysis focuses on the price changes, it is irrelevant whether the German exports to Italy are included in the Italian dataset. The price changes of the Italian producers and German exports to Italy are expected to be basically the same. Also, the Commission notes that the results of the correlation analysis contradict the conditional statement of the Parties that "*ex-works prices for sugar exports from Germany are comparable to ex-works prices for sugar sales within Germany when the market is balanced. Otherwise, it would be more profitable to sell sugar to other destinations*"¹⁵⁰. This is precisely the price arbitrage (price alignment) hypothesis tested by the correlation analysis. If the tested hypothesis of a common geographic market is true the correlation between the two countries' prices should be very strong. If, on the other hand, the estimated correlation is weak (and especially in comparison with the correlations of other country pairs, such as Germany-France) the hypothesis is rejected, and this is interpreted (in this Decision) as evidence consistent with the national market hypothesis. If Germany and Italy were to belong to the same geographic market, the ex-works price of a German factory would be identical irrespective of the destination of the quantities. An increase in the ex-works price for domestic German sales would also be followed by an increase in the ex-works price for exports to Italy which in turn would also be followed by an equivalent increase in the ex-works price of Italian domestic producers. Therefore, the correlation between German and Italian ex work prices as captured by DG AGRI data would be very high, which is however not supported by the data. On the other hand, if one assumes that the two Member States belong to separate geographic markets then the estimated correlation would be an upper bound of the correlation between the two Member States, given the high share of German exports directed into Italy.
- (240) Besides, as Mr Wolfgang Heer claimed in the Oral Hearing "*We have defined the volume of quota sugar which we have to sell in Europe countries and we decide where to sell this sugar. And the price, that is done by the market. [...]*"¹⁵¹.
- (241) This statement shows that ex work prices are not necessarily the same for a given factory. [...]*¹⁵².
- (242) Third, the notifying party suggests that a comparison of biased ex-works prices is unfit to determine whether the competitive situation differs across Member States. However, this view is not explained and is in stark contrast with the reasoning of the Commission as set out above.
- (243) Therefore, the Commission concludes for the reasons described above that overall, the findings of the analysis based on DG AGRI data, which support the qualitative evidence in favour of a separate national market for Italy, remain largely unaffected by the arguments raised by the notifying party.

¹⁵⁰ Supplementary Comments following Oral Hearing received on 12 March 2012, p3.

¹⁵¹ Statement by Wolfgang Heer, Speaker of the Board ('Vorstandssprecher'), during the Oral Hearing of 5 March 2012, minute 43:55 to 44:36 of recording C-15.50-16.42.

¹⁵² [...]*.

Exchange of arguments on Südzucker's own pricing data

- (244) With respect to prices that Südzucker sets in different Member States, the Commission argued in the SO, on the basis of Südzucker's internal documents, that its average sugar prices differ between the different Member States it supplies¹⁵³.
- (245) In its reply to the SO, the notifying party has provided a table with its invoiced prices with inclusion of data from Agrana and Südzucker Polska¹⁵⁴. The resulting differences in levels are lower, notably in Member States where Agrana is active such as [...]*. However, even the revised tables show significant differences in average prices between e.g. Italy and [...]*.
- (246) The notifying party also acknowledges other deficiencies of the data, namely the inclusion of transportation costs and different mixes of products in different Member States to cast doubts on the comparability of the data across Member States. The Commission has concerns that those deficiencies are such that those data are not suitable for an analysis for the purposes of geographic market definition. In particular the Commission considers that the possibly different mix of industrial vs retail sugar sales of Südzucker in different Member States may have an impact on the comparability of the data across Member States. As a result, the Commission considers that those aggregate data are not sufficiently reliable for the purposes of the definition of the geographic market for sugar sold to industrial processors. On the contrary, DG AGRI data, which only consider prices of sugar sold to industrial processors, are much more reliable for the purposes of the geographic market definition.
- (247) The notifying party, while strongly criticising the reliability of Südzucker's pricing data for the purposes of geographic market definition, also provides a graph based on these data on the prices between France, Italy and Germany. On the basis of that graph, the notifying party argues that there is national average price convergence amongst those three Member States. According to the notifying party *"the price increases in Italy in 2010/2011 and 2011/2012 are not the result of limited competitive pressure but of convergence process following years of relatively low prices in Italy not even covering transport costs"*¹⁵⁵. Furthermore, these graphs only include five annual prices and one estimate of prices based on contracted prices for 2011/2012. In this respect, the Commission notes that the *"greater convergence"* of prices takes place in 2011/2012 when contracted and not invoiced prices are graphed, which creates an inherent incomparability¹⁵⁶.

¹⁵³ Annex Q10 Südzucker's reply to the 4th RFI, Phase II. The Commission notes that this data do not include volumes sold by Agrana (Austria and Slovenia) and SZ Polska (Poland, Baltics and partly Scandinavia). At the Commission's request, Südzucker also provided data including all consolidated Südzucker's group companies sales, although stressing that the data is available only on high cumulated levels. In any event, this does not change the fact that the prices differ between the different Member States supplied.

¹⁵⁴ Table 2 of reply to the SO, p. 43.

¹⁵⁵ Figure 2, reply to the SO, p. 47.

¹⁵⁶ The Parties in para 12 their Reply to the Letter of Facts claim that the Commission had in its possession the data underlying the graph. The Parties only hide in their last sentence that the Commission's point in the Letter of Facts (para 20) only relate to the use of contracted data for 2011/2012 as opposed to invoiced data for previous years. The Parties only further submit that contracted prices are extracted

- (248) Even if the data provided by the notifying party in this context were reliable, they would still not support the geographic market definition as being national. Even if the graph was based on comparable data it would merely show a starkly different evolution of prices in different Member States.
- (249) First, the notifying party acknowledges that prices in Italy were for several years lower than in Germany and in particular in France. For several years there has been a difference of prices of around EUR [...] between the sales of the notifying party notably in [...] and Italy. This is even more striking as the transport costs for the notifying party are higher for Italy than in [...] (as in Italy, in contrast to [...]). Assuming comparable sales in different Member States, the graph would show that the arbitrage opportunities between Member States are not exploited which can lead to persistent price differences well above transport costs (this arbitrage argument would need to hold also in cases of asymmetric shocks across Member States, as described by the notifying party¹⁵⁷). Second, even the evolution of prices as shown by the notifying party's graph shows a greater co-movement between Germany and France than between these two Member States and Italy, which is also consistent with the result of the correlation analysis described before.
- (250) Therefore, while acknowledging that the data have several limitations, it has to be noted that if the data were considered at face value they show that the notifying party's prices may well differ across Member States for a persistent period. Contrary to the Parties' claim in the Letter of Facts that these differences were due to the transitory period post 2006 reform, such sustained differences show a clear lack of arbitrage amongst Member States.
- (251) In view of the above, the Commission considers, on the basis of DG AGRI data, that the price differences between Italy and its neighbouring Member States are not arbitrated away. In addition, the price changes in the Italian market co-move less strongly with its neighbouring (exporting) Member States than these neighbouring Member States' price changes co-move amongst each other. This finding suggests that the Italian market is relatively more isolated than its neighbouring countries. The arguments raised by the notifying party on the comparability of DG AGRI data do not affect the above conclusions of the analysis. Finally, the Südzucker aggregate pricing data is not sufficiently reliable for the purpose of the geographic market definition of sugar sold to industrial processors in Italy.

(4) MARKET POSITIONING OF COMPETITORS DIFFERS SIGNIFICANTLY ACROSS MEMBER STATES

- (252) The presence of the same major suppliers or producers in a number of countries or regions provides initial evidence suggestive of a market comprising those countries or areas. However, the Commission will also seek to determine whether there are material deviations in those countries or regions¹⁵⁸.

form ordinary course of business data and invoiced prices at the end of the year "do not usually significantly differ" without providing any further evidence.

¹⁵⁷ In their Reply to the Letter of Facts, the Parties also provide a list of reasons pointing to asymmetric (i.e. only relevant for Italy) and symmetric shocks (EEA wide shocks) during the transitory period.

¹⁵⁸ See Commission Decision of 27 July 2001 in Case No IV/M.2337 - Nestlé/Plaston Purina, OJ C 239, 25.8.2001, p. 8; Commission Decision of 8 January 2002 in Case No COMP/M.2621 - Seb/Moulinex,

- (253) Generally, the Commission views significant national market share differences as evidence that the conditions of competition are not sufficiently homogeneous to support a wider geographic market definition¹⁵⁹.
- (254) In the case at hand, even more than 6 years after the latest reform, the market shares of all European players are very different depending on the Member States in which they sell sugar. This is illustrated by the presence of Südzucker, the main European sugar producers, in the various Member States.
- (255) Indeed, Südzucker held the following market shares (for the sales of white sugar to industrial processors) for the marketing year 2010/2011 of: [70-80]*% in Austria, [30-40]*% in Germany, [20-30]*% in France, [60-70]*% in Belgium, [0-5]*% in the Netherlands, [40-50]*% in Hungary, [5-10]*% in Denmark and [5-10]*% in the United Kingdom.
- (256) Similarly, Nordzucker, the second main sugar producer in Europe, held on the same product market and the same year market shares of [30-40]*% in Germany, [60-70]*% in Finland (through Nordic Sugar AB), [40-50]*% in Latvia and [5-10]*% in Poland and has almost no presence in France, Italy and Spain.
- (257) Such significant divergences in market shares from one Member State to another, in particular where those Member States are neighbouring, point towards the existence of national markets in this case.

(i) *Greece*

- (258) The market investigation conducted in this case has demonstrated that Greece is a deficit country like Italy. Therefore, the existence of imports itself does not suggest that those imports pose competitive constraints on competitors in Greece because such imports simply derive from the regulatory environment. The demand and supply patterns are similar to those in Italy; similar price and market share differences are also observed in Greece like in Italy. Therefore, although Greece is a deficit Member State and imports are important in order to fulfil the domestic sugar needs, from a customer and organisation of supplies perspective the market is likely to be national. However, as the likelihood of entry of EDFM in Greece is low and as the proposed transaction would not lead to any significant impediment of effective competition under the narrowest possible market definition, there is no need to conclude on the precise scope of the geographic market as regards Greece.

¹⁵⁹ OJ C 49, 22.2.2002, p. 18; *Summary of Commission Decision in Case No COMP/M.4513 - Arjowiggins/M-real Zanders Reflex*, OJ C 96, 25.4.2009, p. 10. In Commission Decision 2003/777/EC in Case No COMP/M.2861 - Siemens/Drägerwerk/JV, OJ L 291, 8.11.2003, p. 1, the Commission identified national markets for therapy equipment, inter alia because of wide variations of market shares (ranging from 65-75% in some countries to 5-15% in others). In Commission Decision of 29/06/2007 in Case No COMP/M.4540 - Nestlé/Novartis, OJ C 229, 29.9.2007, p. 1, the Commission identified national markets for nutrition products inter alia, because of "significant unexplained price differences among Member States" and "considerable" differences of the parties and their competitors.

6.1.3.5. Conclusion

- (259) For the reasons illustrated above, the Commission takes the view that with regard to Italy and for the purposes of the assessment of the proposed transaction the geographic market for the supply of white sugar to industrial processors and the market for the supply of white sugar to retailers is national in scope.

6.1.4. *EFFECTS ON COMPETITION / COMPATIBILITY WITH THE INTERNAL MARKET*

(i) Supply of white sugar to industrial processors in Italy

- (260) The following competitive assessment presents a number of factors on the basis of which the Commission concludes that the proposed transaction results in non-coordinated effects in the market for the supply of white sugar to industrial processors in Italy. The Parties' combined market shares are significant in this relevant market for the supply of white sugar to industrial processors in Italy. As a first illustration for the markets for the supply of white sugar to industrial processors and to retailers in Italy, a table below presents the market shares for these two relevant markets as defined by this Decision. It also shows the market shares of the main competitors. The presentation then examines, first, the elements pointing towards price rises before discussing possible expansion of output by competitors, potential buyer power of industrial processors and likely, timely and sufficient entry of new competitors into the relevant market post-merger, in line with the framework for analysing non-coordinated effects in the Guidelines on the Assessment of horizontal mergers under the Council Regulation on the control of concentrations between undertakings¹⁶⁰ (the "Horizontal Merger Guidelines")¹⁶¹.
- (261) The proposed transaction has the following characteristics and consequences: (i) Südzucker is the most important player on the Italian market for the supply of white sugar to industrial processors, (ii) EDFM is an important player on the same market, (iii) the increment added by the proposed transaction is significant (conservatively estimated at [10-20]*%), (iv) the post-merger market shares are very high (superior to [50-60]*%), (v) Südzucker and EDFM are close competitors and are the two competitors that can most easily adapt their quantities/sales in the Italian market, (vi) post-merger the merged entity would have the incentive and ability to withdraw quantities from Italy, thereby raising prices, (vii) the competitors of the merged entity, established in Italy or outside Italy, face capacity constraints and therefore are unlikely to increase supply if prices increase, and therefore to counteract such market behaviour, (viii) countervailing buyer power appears unlikely to constrain the ability of the merged entity to increase prices post transaction, especially in periods of overall shortage of sugar supply, and (ix) entry post-merger in the relevant market is not likely, sufficient and timely. As a result of all the elements enumerated above, it is concluded that the proposed transaction would significantly impede effective competition, in particular as a result of the creation of a dominant position.

¹⁶⁰ OJ C 31, 5.2.2004, p. 5.

¹⁶¹ Pages 5 – 18 of the Horizontal Merger Guidelines.

6.1.4.1. Introduction

- (262) Italy is the second largest sugar consumer after Germany. In Italy, the annual demand amounts to approximately 1.73 million tonnes of sugar¹⁶², with sugar sold to industrial processors accounting for around 70% of that demand. Italy is one of the largest deficit sugar markets in the Union.
- (263) Prior to the 2006 sugar reform, Italy was mainly supplied with sugar by local producers; COPROB/Italia Zuccheri had a market share of 30%, Eridania Sadam 30%, SFIR 18% and Zuccherificio del Molise 4%. Approximately 18% of Italy was supplied by sugar imports¹⁶³.
- (264) However, as already mentioned, in Italy 15 out of 19 sugar beet factories closed following the 2006 sugar reform. Therefore, prior to the launch of the Brindisi refinery in December 2010, less than half of Italian demand was covered by domestic (beet sugar) production. Apart from the Brindisi refinery, Italian sugar production in 2011 consisted of beet sugar production carried out by three companies:
- (a) Eridania: one beet factory in San Quirico (Parma) with a capacity of [...] tonnes per year¹⁶⁴.
 - (b) COPROB/Italia Zuccheri: one beet factory in Minerbio with a capacity of [...] tonnes per year and one beet factory in Pontelongo with a capacity of [...] tonnes per year¹⁶⁵.
 - (c) Zuccherificio del Molise: one beet factory in Termoli with a capacity of [...] tonnes per year¹⁶⁶.
- (265) If the [...] tonnes per year¹⁶⁷ of cane sugar production capacity of the Brindisi refinery are also taken into account, it follows that at least 875,000 tonnes of the 1.73 million tonnes per year of Italian sugar demand have to be satisfied via imports mainly from the closely located surplus Member States, such as France and Germany.
- (266) Around 60% of all sugar is consumed in the North of Italy. The Centre and South of Italy are in a more disadvantageous situation, as they are located further away from production facilities, with the exception of Brindisi and Termoli, and from the exporting countries. According to internal documents of EDFM, based on an internal logistics model¹⁶⁸, the average transportation costs for imports (mainly from Germany, Austria and France) in the whole of Italy amount to EUR [...] per tonne, while the transportation costs to the Centre and South of Italy amount to EUR [...] per tonne.

¹⁶² See below the reconstructed table of market shares in recitals (336) and (337) of this Decision.

¹⁶⁸ Annex 5b of Südzucker's answer to the 2nd RFI in Phase I.

6.1.4.2. The Italian sugar market structure prior to the proposed transaction

Role of Südzucker

- (267) Südzucker, the leading supplier in Italy, markets and sells refined sugar through the joint venture Maxi Srl (an Italian sugar trader), which Südzucker jointly controls together with Podini Holding S.p.A.
- (268) Even at the beginning of its commercial activity in Italy, direct sales from Südzucker to industrial processors or to retailers had always been very rare¹⁶⁹. Until the end of the 1990s, Südzucker used to sell sugar to various traders in Italy. However, in 2000 Südzucker entered into a cooperation agreement with MAXI, and thus Südzucker's sales in Italy became more and more channelled through MAXI. At the end of 2006, the cooperation agreement between Südzucker and MAXI was substituted by a joint-venture through the acquisition of a 50% stake by Südzucker in MAXI¹⁷⁰.
- (269) [Description of MAXI]*¹⁷¹. [Description of MAXI]*
- (270) As a result, MAXI has been integrated into the overall Union sugar marketing of Südzucker [...]*¹⁷² [Description of MAXI]*¹⁷³.
- (271) Since Italy is the second largest consumer of white sugar in the Union and has a substantial deficit, over the past five years Südzucker has had a clear commercial strategy [Description of Südzucker's strategy]*.
- (272) Südzucker has admitted that the main reason for its focus on the Italian market has been the expectation that Italy would become a large deficit market after the closure of large parts of its domestic beet production¹⁷⁴. Furthermore, Südzucker submitted that it had envisaged supplying to Italy up to [...]* tonnes of sugar per year to Italy¹⁷⁵. Indeed, a presentation from 2006 shows that Südzucker was aiming at supplying approximately [...]* tonnes/year to the Italian market¹⁷⁶.
- (273) In fact, Südzucker has increased its sales volume drastically from approximately [...]* tonnes in 2008¹⁷⁷ to approximately [...]* tonnes in 2010¹⁷⁸ following a very conscious expansion strategy.
- (274) Therefore, today Südzucker is the largest and fastest growing player in Italy.

¹⁷⁷ Annex Q16-1 (chart at p. 16) of Südzucker's answer to the 3rd RFI in Phase II.

¹⁷⁸ Annex Q16-7.3.a of Südzucker's answer to the 3rd RFI in Phase II.

Role of EDFM

- (275) In 2008, EDFM engaged in a [...] joint-venture with SFIR. The joint-venture was the Brindisi refinery and its purpose was to build and operate a new raw cane refinery in Brindisi, in the south of Italy.
- (276) Both EDFM and SFIR made considerable investments in SRB. The whole project was originally budgeted at EUR [...] million¹⁷⁹, but an additional contribution of EUR [...] million¹⁸⁰ was made in September 2010.
- (277) Both EDFM and SFIR exercise control over SRB. The voting shares in SRB are held [...] between the two partners. [Description of SRB]¹⁸¹. [Description of SRB]¹⁸².
- (i) EDFM jointly controls with SFIR the sales of white sugar from the Brindisi refinery to industrial processors in Italy
- (278) According to the Parties, ESI, a 100% subsidiary of SFIR in charge of [...], buys in principle [...] white sugar produced by SBR. From December 2010 to October 2011, SRB sold [...] tonnes to ESI, while exporting [...] tonnes to [...] and [...] tonnes to [...]¹⁸³.
- (279) The Parties claim that EDFM [...] the sugar produced in the Brindisi refinery¹⁸⁴ and thus SRB is in their view [...] of the sugar produced. They argue that sugar originating in the refinery is sold [...] to ESI, who then relying on its historical customer relationships and storage facilities [Description of SRB and ESI].
- (280) However, the investigation with regard to the role of EDFM in the sales and marketing of the white sugar produced by SRB does not confirm the Parties' claim. In fact, internal documents show that [Description of SRB].
- (281) The SRB joint-venture agreement between EDFM and SFIR states that the purpose of the joint-venture is to *refine, sell and distribute* sugar¹⁸⁶. Indeed, the partners even agreed [Description of SRB]¹⁸⁷. [Description of SRB].
- (282) Furthermore, in the markets for the supply of white sugar it is the supplied quantity that directly determines the price. This has been illustrated by Südzucker in the Oral Hearing of 5 March 2012: [...] ¹⁸⁸. Given that it is the Brindisi refinery that

¹⁸⁶ Article 3 of the Brindisi Joint Venture Agreement (Annex 1.a of EDFM's reply to the 2nd RFI in Phase I), which states that the business of SRB is [...].

¹⁸⁷ Article 14 of the Brindisi Joint Venture Agreement submitted as Annex 1.a of EDFM's reply to the 2nd RFI in Phase I.

¹⁸⁸ Statement by Wolfgang Heer, Südzucker, during the Oral Hearing of 5 March 2012 (minute 43:55 to 44:36 of recording C-15.50-16.42).

determines the quantities that ESI can sell in Italy, necessarily it is also the Brindisi refinery that determines the price at which those quantities will be sold.

- (283) In the Brindisi refinery, the production output and sales of the refined sugar are discussed [Description of SRB]*¹⁸⁹, where there is [Description of SRB]*¹⁹⁰. [Description of SRB]*. In this respect, the argument of the Parties that [Description of SRB]* is immaterial. The fact that [Description of SRB]* indicates its influence on marketing.
- (284) The internal documents submitted by EDFM also demonstrate that [Description of SRB]*¹⁹¹. In particular, the internal document entitled as [...] *¹⁹² indicates that [Description of SRB]*.
- (285) Moreover, the [...] * minutes of [...] * state that [Description of SRB]*¹⁹³. According to the minutes of [...] *,¹⁹⁴. During that meeting, the participants also agreed [Description of SRB]*¹⁹⁵.
- (286) The minutes of meetings of [...] * further demonstrate that, [Description of SRB]*¹⁹⁶. [Description of SRB]*¹⁹⁷, [Description of SRB]*. This is also demonstrated by the sale of [...] * tonnes to [...] * and [...] * tonnes to [...] * by SRB¹⁹⁸.
- (287) The minutes of the meeting of [...] * of [...] * indicate that [Description of SRB]* and further support that ESI acts [Description of SRB and ESI]* as [Description of SRB and ESI]* for the joint venture rather than [Description of SRB and ESI]*¹⁹⁹.
- (288) The reason for EDFM's active participation in the value created through refining and production of white sugar can be found in the business case study for Brindisi, which EDFM conducted prior to the creation of SRB. This study did not solely concern the supply of raw cane sugar, but also covered extensively the economics of the Italian white sugar market²⁰⁰.
- (289) Indeed, EDFM has a strong financial interest to control the selling activity of SRB. The total capital expenditure for the Brindisi refinery project is quite substantial, amounting to approximately EUR [...] * million. The raw cane supplies to the Union are currently particularly tight and the [...] *. As the initial business case study

²⁰⁰ See, for example, the "Information Memorandum", the "Project Overview" and the "Competitive Analysis of supplying Sugar to the Italian Market", submitted respectively as Annexes 4, 5.a and 5.b of EDFM's answer to the 2nd RFI in Phase I.

indicates [Description of SRB]*²⁰¹. [Description of SRB]*²⁰². [Description of SRB]*²⁰³ [Description of SRB]*.

- (290) In its reply to the Statement of Objections²⁰⁴, Südzucker claimed that the sales of white sugar produced by SRB should not be attributed to EDFM.
- (291) First, according to Südzucker, SRB is in charge of "wholesale" sales to ESI, whereas ESI is in charge of the "retail" sales to the industrial processors and retailers. [Description of SRB]* Südzucker believes that the mention in the [...] minutes of [...] is a normal mechanism when a production company sells to a marketing and sales company. In this context, ESI's sales of white sugar (quality, quantity and prices) were discussed on [...] and a discussion on the creation of [...] took place. [Description of SRB]*.
- (292) Second, the plan that ESI would [Description of SRB and ESI]* was a proposal that was never implemented²⁰⁵.
- (293) Third, Südzucker submitted that the purpose of the [...] clause in the Brindisi Joint-Venture Agreement (the "JV Agreement")²⁰⁶ was only to [Description of SRB]*.
- (294) Fourth, the documents in preparation of the SRB project²⁰⁷, where EDFM and SFIR discuss extensively the economics of white sugar sales in Italy and average prices that could be achieved, are not evidence that SRB would market white sugar in Italy.
- (295) The above arguments put forward by the notifying party cannot be accepted. The sales of white sugar produced by SRB should be attributed to EDFM, [Description of SRB and ESI]*.
- (296) First, ESI's sales to industrial customers and to retailers cannot constitute "retail" sales, since these customers are still supplied at the wholesale level. It is retailers that then sell at the retail level to the end-customers. [Description of SRB and ESI]* this argument does not alter the conclusion that it is SRB [Description of SRB and ESI]* for the white sugar produced in Brindisi. In that regard, SRB does not need to know individual clients and prices of ESI.
- (297) For SRB to make [Description of SRB and ESI]*²⁰⁸ [Description of SRB and ESI]* is sufficient. On the basis of [Description of SRB and ESI]*, SRB can set the price at which it sells white sugar to ESI [Description of SRB and ESI]*.
- (298) [Description of SRB and ESI]*.

²⁰¹ See the "Information Memorandum" submitted as Annex 4 of EDFM's answer to the 2nd RFI in Phase I.
²⁰² "Operational Progress Report" submitted as Annex 5.c of EDFM's answer to the 2nd RFI.
²⁰³ EDFM's answer to the 3rd RFI in Phase I.
²⁰⁴ Paragraphs 108 *et seq.*
²⁰⁵ Annex 5.b in EDFM's answer to the 5th RFI of 7 October 2011 in Phase I.
²⁰⁶ Article 3 of the Brindisi Joint Venture Agreement, which states that the business of SRB is [...]*.
²⁰⁷ See, for example, the "Information Memorandum", the "Project Overview" and the "Competitive Analysis of supplying Sugar to the Italian Market", submitted respectively as Annexes 4, 5.a and 5.b of EDFM's answer to the 2nd RFI in Phase I.
²⁰⁸ As demonstrated *inter alia* in the document "ESI transfer price analysis" submitted as Annex 17 of EDFM's answer to the 6th RFI in Phase I.

- (299) Second, even if the plan that ESI [Description of SRB and ESI]* was an unimplemented proposal²⁰⁹, the fact that this proposal was discussed and almost implemented in the SRB [...] shows that SRB [Description of SRB]* and that EDFM [Description of SRB]*.
- (300) Third, if SRB were [Description of SRB]* and each party to the joint venture wanted to ensure that [Description of SRB]*, a [...] clause would be unnecessary and irrelevant, since [Description of SRB]*. In fact, if SRB were [Description of SRB]* it would not be conceivable that [...]. Nevertheless, the [...] clause of the Joint Venture Agreement states that [Description of SRB]*²¹⁰.
- (301) Fourth, if SRB were a [Description of SRB]*, EDFM and SFIR would have only analysed the ways to efficiently produce white sugar from raw cane. Nevertheless, the fact that [Description of SRB]*²¹¹ also points towards the conclusion that [Description of SRB]*.
- (302) In the light of the above and, in particular, EDFM's active participation in [Description of SRB]* and the [Description of SRB]*, the refined sugar sales of the refinery should be attributed to EDFM. Therefore, EDFM controls SRB, which markets the white sugar it produces, and thus the sales of white sugar produced by SRB should be attributed to EDFM.
- (ii) EDFM has secured the supply of raw cane sugar input to the Brindisi refinery
- (303) SRB benefits from three [...] contracts [...]²¹²: [contracts with Supplier A, Supplier B and Supplier C]*
- (304) Therefore, in times of scarcity of raw cane sugar for refineries in the Union, the Brindisi refinery has secured the input of at least [...] tonnes [...].
- (305) Moreover, EDFM has also concluded two other [...] contracts: (i) the contract with [...] in [...], which gives [...], and (ii) the contract with [...] in [...]²¹³.
- (iii) EDFM's participation in the DAI refinery
- (306) SFIR does not only depend on EDFM with respect to the [...] supply contracts secured for the Brindisi refinery, but also with respect to the operation of the DAI refinery, which is situated in Coruche (Portugal) located approximately 65km from the Port of Setubal. The current shareholders of the DAI refinery are EDFM with [...]*%, SFIR with [...]*%, "Sociedade Industrial de Açúcar" with [...]*% and "Caixa de Crédito Agrícola Mútuo de Coruche" with [...]*%. Originally a sugar beet factory, since 2007 the DAI refinery has re-focused its operations on refining due to the sugar reform. Over the first three years of the sugar reform, DAI has renounced its entire

²¹³ EDFM's answer to the 3rd RFI in Phase I.

beet quota to the Union restructuring fund and is concentrating on achieving maximum refinery output and sales, in line with the refinery's designed capacity of [...] tonnes/year²¹⁴.

Role of other sugar suppliers

- (307) Due to the negative impact of the 2006 sugar reform in Italy in terms of sugar production, the traditional Italian sugar manufacturers, such as Eridania, COPROB/Italia Zuccheri and SFIR, have been trying to maintain their "pre-reform" market share. In that context, they have established joint-ventures mainly with manufacturers from surplus Member States, and/or are building raw cane refining facilities, in order to satisfy the demand of their customers.
- (308) In that context, the following developments have taken place:
- (a) the German sugar manufacturer Pfeifer & Langen has acquired 49.9% of the sales subsidiary of COPROB/Italia Zuccheri ;
 - (b) the British sugar manufacturer Tate & Lyle had established a joint-venture with Eridania for the marketing and sales of all their sugar products. In the course of 2011, Tate & Lyle left the Italian market (because it did not have sufficient raw sugar input) and subsequently the French sugar manufacturer Cristal Union via CristalCo stepped in and replaced it in the joint-venture with Eridania;
 - (c) SFIR has gone into a different direction by building a new refinery in a joint-venture with EDFM in the South of Italy (SRB). Meanwhile, SFIR also bought white sugar from other players, such as EuroSugar (Nordzucker, Sucre Union, EDFM) in order to satisfy the demand of its customers;
 - (d) the French sugar manufacturer Tereos has entered the market by establishing its own national sales office for Italy. However, this does not break the pattern of joint-venture entry in Italy for the following reasons: (i) Tereos' entry took place in 2006, thus very early in the reform at a period when producers still disposed significant volumes of sugar; and (ii) Tereos' market share in Italy has remained stable over the past years and is way below that of other foreign players, such as Südzucker who teamed up with MAXI the same year and has increased its presence significantly over the last 5 years.

Wholesalers

- (309) In the Form CO and in the first two Requests for Information, the Parties did not mention wholesalers as a competitive force in the Italian market. In the market shares submitted in the 2nd Request for Information²¹⁵, the Parties only identified Eridania/Tate & Lyle, Pfeifer & Langen/COPROB/Italia Zuccheri, SFIR and Tereos as competitors in the markets for sales of white sugar to industrial processors and to retailers in Italy.

²¹⁴ EDFM's answer to Question 4 of the 3rd RFI in Phase I.

²¹⁵ Annex 19 of Südzucker's answer to the 2nd RFI in Phase I.

- (310) However, when the issue of EDFM's control over the Brindisi refinery was raised, and thus that its sales should be attributed to EDFM, the Parties submitted new market share estimations²¹⁶. These new estimations included a new category of suppliers, the "wholesalers", to whom the Parties attributed 20% of the market for sales to industrial processors and 18% of the market for sales to retailers in Italy.
- (311) According to Südzucker, wholesalers constitute a significant competitive factor in the Italian sugar market. Wholesalers have a multitude of sources which they can easily change and the volume that they trade amounts to approximately 20% of total consumption. It is also put forward by the notifying party in this context that wholesalers fulfil transparency and arbitrage functions in a perfectly competitive Italian market. Finally, according to Südzucker, wholesalers have very good relationships with the customers, and the supplier's brand is irrelevant in the Italian sugar market.
- (312) However, Südzucker acknowledged that wholesalers obtain a large proportion of their sales volumes from the same producers and/or importers who are selling also directly to industrial processors and retailers in Italy²¹⁷. SFIR has also stated that wholesalers are mostly active in servicing customers (industrial processors and retailers) who need special service requirements or who require only small volumes, in particular hotels, restaurants, catering, bars, bakeries, patisseries²¹⁸.
- (313) According to the second phase market investigation²¹⁹, only 6 out of 33 customers consider wholesalers as a significant competitive constraint on white sugar producers/suppliers in Italy, whereas more than half of the customers do not have any business relationship with wholesalers. Furthermore, only 5 out of 12 wholesalers consider themselves to constitute competitive constraints on existing producers/suppliers in Italy. Moreover, with one exception, none of the producers/suppliers who are active in Italy considers wholesalers as a competitive constraint on them.
- (314) During the second phase market investigation²²⁰, approximately 1/3 of customers were of the view that wholesalers import part of their sugar supplies from sources different from the existing producers/suppliers in Italy. On their part, all wholesalers replied that they purchase from 2/3 to 100% of their supplies from existing producers/suppliers in Italy, with the exception of one wholesaler who purchases approximately 1/3 of its supplies from existing producers/suppliers in Italy. In any event, even under the broadest interpretation of the data from the market investigation, the wholesalers' total sugar supplies from sources different than the existing producers/suppliers in Italy would not exceed 50,000-70,000 tonnes per year.

²¹⁶ Annex 4 of Südzucker's answer to the 3rd RFI in Phase I.

²¹⁷ Südzucker's answer to Question 25 of the 3rd RFI in Phase II.

²¹⁸ SFIR's answer to Question 58 of the 2nd RFI in Phase II.

²¹⁹ Questionnaire to sugar customers – Phase II.

²²⁰ Questionnaire to sugar customers – Phase II.

- (315) Moreover, internal documents of the Parties only distinguish between sales to [...] while not even mentioning sales to wholesalers as a distinct category of sales²²¹. Therefore, the Parties themselves regard the wholesalers as pure intermediaries that cannot exercise arbitrage.
- (316) When the Parties were requested to present internal documents supporting that wholesalers are perceived as competitors for the sale of white sugar in Italy, the Parties admitted that they were unable to provide such documents²²². The only such document that the Parties could provide at a much later stage²²³ was the presentation held by Mr [...] on the acquisition of a 50% stake in MAXI, where wholesalers MAXI, Inagra and Csapo were allegedly presented on equal footing with the sugar producers Italia Zuccheri/COPROB, Eridania/Saddam and SFIR.
- (317) However, that presentation was dated on 17 July 2006. Such a document of more than five years ago cannot reflect the (drastically altered) situation in the Italian white sugar markets post-reform. Indeed, prior to the 2006 sugar reform, wholesalers might have had a different role because of the different market structure in the Italian sugar market. Until 2006, sugar wholesalers might have been able to have an impact on the Italian white sugar markets, since Italian and Union production were higher and wholesalers could buy from different sources. Thus, it cannot be excluded that until 2006 wholesalers might have played an arbitrage role and thus possibly contributed to a price decrease. Today, however, the lack of available sugar supply as well as the sales agencies put in place by the large sugar market producers/suppliers, such as MAXI, certainly leave very little room for manoeuvre for wholesalers in the Italian deficit markets²²⁵.
- (318) Furthermore, Südzucker does not systematically monitor wholesalers (if it does so at all), since the abovementioned presentation was the one and only internal document that Südzucker could invoke as evidence for the wholesalers' alleged role as competitors in the Italian sugar markets. In particular, this presentation analyses [...] and therefore its focus was on alternative wholesalers active in the market, irrespective of their ability to set/constrain prices in the market.
- (319) The presentation also demonstrates that [...]. It also shows that all important wholesalers are systematically coupled with an important sugar producer²²⁶. Indeed, MAXI, Inagra and Csapo are clearly indicated to be wholesalers as opposed to producers and in particular MAXI is portrayed as a partner of [...] Csapo as a partner of [...] and Inagra as [...] and delivered by [...]. Therefore, this presentation also stresses the economic dependency of these wholesalers from producers.
- (320) Moreover, when contacted during the market investigation²²⁷, the Autorità Garante della Concorrenza e del Mercato, the Italian NCA, also confirmed the Commission's

²²² Südzucker's answer to Question 2.e of the 5th RFI in Phase I.

²²³ Südzucker's answer to Question 25 of the 3rd RFI in Phase II.

²²⁴ Annex 23 of Südzucker's answer to the 2nd RFI in Phase I.

²²⁵ See, for instance, minutes of the conference call with Achard Italia on 15 December 2011.

²²⁶ Annex 23 of Südzucker's answer to the 2nd RFI in Phase I, at pages 9-10.

²²⁷ Conference call on 1 December 2011.

understanding that wholesalers do not exercise a competition constraint in the Italian sugar markets.

- (321) In its reply to the Statement of Objections²²⁸, Südzucker restated its views on the competitive role of wholesalers.
- (322) First, the notifying party claimed that wholesalers source quantities of sugar from sources different from the existing suppliers in the Italian sugar markets. Wholesalers source on average 1/3 of their requirements abroad, which amounts to more than 110,000 tonnes of white sugar. Moreover, seven wholesalers import sugar from Croatia and Serbia.
- (323) Second, it was claimed that the majority of customers view wholesalers as a competitive force in Italy and five out of twelve wholesalers consider themselves as competitive constraint on sugar producers in Italy.
- (324) Third, wholesalers account for [20-30]*% of total consumption and without them Südzucker would have never reached sales of [...]* tonnes/year. Südzucker has named [...]* wholesalers that could sell more sugar in Italy. Half of the customers have business relationships with wholesalers. Südzucker's internal documents do not mention wholesalers because they are an Italian particularity and, in any event, Südzucker's internal documents do not mention much about other competitors either.
- (325) The above arguments put forward by the notifying party cannot be accepted. For the following reasons, wholesalers cannot be regarded as competitors in the markets for the supply of white sugar to industrial processors in Italy and to retailers.
- (326) First, Südzucker's claim that wholesalers source on average 1/3 of their requirements abroad is not based on any evidence. On the contrary, during the market investigation all wholesalers replied that they purchase from 2/3 to 100% of their supplies from existing producers/suppliers in Italy, with the exception of one wholesaler who purchases approximately 1/3 of its supplies from existing producers/suppliers in Italy²²⁹.
- (327) Even under the broadest interpretation of the data from the market investigation, the wholesalers' total sugar supplies from sources different than the existing producers/suppliers in Italy would not exceed 50,000-70,000 tonnes per year. This quantity is very small compared to total Italian consumption of 1.73 million tonnes/year. Furthermore, imports from Croatia to the Union are expected to significantly decrease post-accession as analysed in recitals (509) to (514) of this Decision.
- (328) Second, only five out of twelve wholesalers consider themselves as competitive constraint on sugar producers in Italy and the majority of wholesalers do not share that view. Most importantly, with one exception, none of the producers/suppliers who are active in Italy considers wholesalers as a competitive constraint on them.

²²⁸ Paragraphs 203 *et seq.*

²²⁹ Statement of Objections, para. 195.

- (329) Third, the fact that 20% of sales in Italy might be passing through wholesalers as pure intermediaries does not render wholesalers competitors, since the existing producers/suppliers remain in full control of these quantities and, in essence, the prices at which they are sold. If wholesalers played such an important competitive role in Italy, as the Parties claim, there should be at least one internal document of Südzucker, MAXI or EDFM mentioning the allegedly special role of wholesalers in Italy.
- (330) Therefore, the arguments submitted by Südzucker for the attribution of sales to Italian "wholesalers" in the Italian markets for the sale of white sugar to industrial processors and to retailers cannot be accepted within the course of the assessment of the proposed transaction.
- (331) In view of the above, it is concluded that wholesalers are not regarded as competitors in the Italian markets for sales of white sugar to industrial processors and to retailers.

Market shares of the Parties and their competitors

- (332) In the Form CO, the notifying party submitted that the Parties' activities did not overlap in Italy, where only Südzucker was allegedly active as a supplier of white sugar with market shares of [40-50]*% (regarding sales to industrial processors) and [10-20]*% (regarding sales to retailers). In particular, the Parties submitted the following table,²³⁰ where Südzucker's sales and market shares were calculated over the period from March 2010 to February 2011, whereas EDFM's sales and market shares were calculated over the period from October 2009 to September 2010. The notifying party thus attributed no sales to EDFM in Italy, where the Brindisi refinery had started operating in December 2010.

²³⁰ Annex 7.3.a of the Form CO.

	White sugar sales to industrial processors, including liquefied white sugar, refined cane sugar		White sugar sales retailers	
	Qty in mt	Market share in % of Qty	Qty in mt	Market share in % of Qty
Total market 2009/2010 (without sales to Ethanol industry)	[...]*	[90-100]*	[...]*	[90-100]*
Südzucker 2010/2011	[...]*	[40-50]*	[...]*	[10-20]*
[...]*	[...]*			
ED&F MAN 2009/2010		-		-
[...]*	[...]*	[40-50]*	[...]*	[10-20]*
Eridania / Tate & Lyle	[...]*	[20-30]*	[...]*	[30-40]*

SFIR	[...]*	[10-20]*	[...]*	[10-20]*
Tereos	[...]*	[10-20]*	[...]*	[10-20]*

(333) When the issue of EDFM's control over the Brindisi refinery was raised, and in particular that its sales should be attributed to EDFM, the notifying party submitted new market share estimates.²³¹ As explained above, the new data included a new category of suppliers, the "wholesalers",²³² to whom the Parties attributed 20% of the market for sales to industrial processors and 18% of the market for sales to retailers in Italy. Furthermore, the notifying party attributed a significant amount of sales to "others",²³³ although Südzucker admitted that it could not provide accurate estimates of companies and quantities supplied in Italy under this vague category.²³⁴ In particular, for the period from January 2011 to September 2011, the Parties submitted the following table:

²³¹ Südzucker's reply to the 4th RFI in Phase I.

²³² This category has been highlighted in red in the table that follows.

²³³ This category has been highlighted in red in the table that follows.

²³⁴ Südzucker's answer to Question 1 of the 5th RFI in Phase I.

	White sugar sales to industrial processors		White sugar sales retailers	
	Qty in mt	Market share in % of Qty	Qty in mt	Market share in % of Qty
Jan - Sep 11 (without sales to Ethanol industry)	[...]*	[90-100]*%	[...]*	[90-10]*%
Südzucker	[...]*	[20-30]*%	[...]*	[10-20]*%
ED&F MAN incl Brindisi	[...]*	[10-20]*%	[...]*	[10-20]*%
[...]*	[...]*	[30-40]*%	[...]*	[20-30]*%
Eridania / Tate&Lyle	[...]*	[10-20]*%	[...]*	[20-30]*%
Italia Zuccheri / Pfeifer & Langen	[...]*	[10-20]*%	[...]*	[10-20]*%
SFIR (exc. Brindisi)	[...]*	[0-5]*%		[0-5]*%
Tereos	[...]*	[5-10]*%	[...]*	[0-5]*%

Zuccherificio del Molise	[...]*	[0-5]*%	[...]*	[0-5]*%
[...]*	[...]*	[20-30]*%	[...]*	[20-30]*%

(334) However, the market shares submitted by the Parties were not considered credible, in particular for the following reasons:

- (a) The volumes of sales attributed to specific competitors were only the Parties' estimates without any concrete and objective basis for such allegations.
- (b) Wholesalers were attributed a volume of sales as an alleged category of sellers, whereas no sales were attributed individually to each of them. Moreover, the sales attributed to wholesalers were only the Parties' estimates without any concrete and objective basis for such allegations.
- (c) Most importantly, for the reasons analysed under recitals (309) to (331) of this Decision, wholesalers cannot be regarded as competitors in the Italian markets for sales of white sugar to industrial processors and to retailers, and thus no market share should be attributed to them.

(335) Therefore, a market reconstruction on the basis of credible data was necessary. In that market reconstruction, producers' sales to wholesalers were attributed either to industrial processors or to retailers, according to who was the final customer. The fact that producers were able to give precise estimates of the percentage of their sales to wholesalers which is finally sold to industrial processors or to retailers confirms that wholesalers are not competitors in the Italian sugar markets, but pure intermediaries between producers and customers, in line with the reasoning under recitals (309) to (331) of this Decision.

(336) The following table shows the sales of white sugar (in metric tonnes) to industrial processors and to retailers in Italy from 1 January 2011 to 31 October 2011:

	sales to industrial processors		sales to retailers		sales to industrial processors and retailers	
	volume	market share	volume	market share	volume	market share

²⁴³ The forecast of overall sugar sales of [...]* tonnes for the campaign year 2011/2012 is based in the internal document submitted as Annex 6 in Südzucker's answer to the 3rd RFI in Phase I. This figure is then attributed between sales to industrial processors and sales to retailers on the basis of the ratios provided in Südzucker's answer to the 6th RFI in Phase II (including the clarification received by email on 13 January 2012).

²⁴⁴ Internal document entitled as "ESI's sales forecast for 2012" and submitted by EDFM on 13 January 2012.

²⁴⁵ Questionnaire to sugar competitors – Phase II.

²⁴⁶ Questionnaire to sugar competitors – Phase II.

²⁴⁷ Questionnaire to sugar competitors – Phase II.

²⁴⁸ Questionnaire to sugar competitors – Phase II.

	sales to industrial processors		sales to retailers		sales to industrial processors and retailers	
	volume	market share	volume	market share	volume	market share
Sunoko ²⁵⁰	[...]*	[0-5]*%	[...]*	[0-5]*%	[...]*	[0-5]*%
Total volume of competitors	[...]*	[40-50]*%	[...]*	[60-70]*%	[...]*	[50-60]*%
Total market volume	1,278,112	100%	453,827	100%	1,731,939	100%

- (338) Therefore, on the basis of the market reconstruction the Parties appear to have high combined market shares, especially in the market for sales of white sugar to industrial processors in Italy. According to the estimates of the 2011/2012 campaign for sales of white sugar to industrial processors, the pre-transaction clear market leader (Südzucker) joins forces with the 3rd largest player in the market (EDFM including SRB) post-merger. As a result, it is likely that the merged entity would have market shares above [50-60]*% ([50-60]*%) on a market that is already concentrated. The next largest competitor COPROB would have market shares slightly above [10-20]*%. Tereos ([10-20]*%) and Eridania ([5-10]*%) follow with no other player having more than 5%.
- (339) Furthermore, the two tables above are a conservative reconstruction of the Parties' market shares, given that according to the Horizontal Merger Guidelines "*[n]ormally, the Commission uses current market shares in its competitive analysis. However, current market shares may be adjusted to reflect reasonably certain future changes, for instance in the light of exit, entry or expansion*"²⁵¹.
- (340) The combined market shares of the Parties as illustrated in the two tables above should be considered to reflect conservative estimations of their market position, since SRB is still in the initial stages of its start-up period. [Description of SRB]*.²⁵²
- (341) Furthermore, Südzucker's forecasted sales for campaign year 2011/2012 are based on internal planning documents²⁵³, which constitutes the most detailed and substantiated source for this forecast. The Parties themselves have not contested the validity of these internal planning documents or the figures contained therein. The use of the 2011/2012 forecasted sales contained in these planning documents is still a conservative basis, since Südzucker's actual sales tend to exceed its planned sales in a given campaign year²⁵⁴.

²⁴⁹ Questionnaire to sugar competitors – Phase II.

²⁵⁰ Questionnaire to sugar competitors – Phase II.

²⁵¹ Horizontal Merger Guidelines, para. 15.

²⁵² Draft Form RM submitted by the Parties on 16 January 2012, paras 16 and 37.

²⁵³ Annex 6 in Südzucker's answer to the 3rd RFI in Phase I.

²⁵⁴ See, for example, the actual sales of MAXI in campaign year 2010/2011, which exceeded by approximately [...]* tonnes its planned sales for that same year (Annex 8 of Südzucker's reply to the 3rd RFI in Phase I).

- (342) Even on the basis of such conservative estimations, post-transaction the Parties would become the clear leader in the market for white sugar sold to industrial processors with a combined market share of [50-60]*% for the campaign year 2011/2012, while the remaining competitors would have significantly lower market shares.
- (343) In addition, according to the Horizontal Merger Guidelines and settled case-law, *"very large market shares - 50 % or more - may in themselves be evidence of the existence of a dominant market position"*²⁵⁵. Since the Parties' combined market share post-transaction in Italy would reach at least [50-60]*%, this also evidences the creation of a dominant position of the Parties which would allow them to behave independently of competitors and customers.
- (344) Furthermore, the Parties' market shares should be seen dynamically, in order to obtain a more realistic estimation of their market power post-transaction. First, the production of the Brindisi refinery will be at least [...] tonnes per year of white sugar, after its start-up period, as analysed under recitals (361) to (364) of this Decision. Secondly, Südzucker can easily expand in Italy by reallocating sugar across different Member States, since it benefits from the highest quota in the Union of approximately [...] tonnes per year²⁵⁶, which amounts to around [...] of total sugar quota production in the Union. For example, in 2010 Südzucker managed to direct [...] tonnes of white sugar into Italy from other Member States.²⁵⁷ At the same time, all other competitors have limited abilities and no incentive to expand in Italy, as analysed under recitals (393) *et seq.* of this Decision. Thus, in the near future the merged entity could sell [...] tonnes/year of white sugar out of the approximately 1.73 tonnes/year of Italian consumption (for industrial processors and retailers combined).
- (345) In its reply to the Statement of Objections, Südzucker claimed that the combined market share of the Parties amounted to [40-50]*%, i.e. [20-30]*% for Südzucker and [10-20]*% for ESI/SFIR/EDFM, on the basis of a market volume of 1.73 million tonnes per year.
- (346) Nevertheless, Südzucker's calculation of the combined market share of the Parties is manifestly incorrect. First and most importantly, Südzucker calculated and provided an "overall" combined market share, since it took into account the volumes both in the market for the supply of white sugar to industrial processors and in the market for the supply of white sugar to retailers in Italy. However, as noted above in section 6.1.2 of this Decision, these are two different product markets and Südzucker should have calculated the respective market shares separately.
- (347) In view of the above, the Parties have high combined market shares of at least [50-60]% in the market for sales of white sugar to industrial processors in Italy. Therefore, in an already concentrated industry, further consolidation would take place and the proposed transaction would create a market leader unmatched by its competitors.

²⁵⁵ Horizontal Merger Guidelines, para. 17, citing Case T-221/95, *Endemol v. Commission*, [1999] ECR II-1299, para. 134, and Case T-102/96, *Gencor v. Commission*, [1999] ECR II-753, para. 205.

²⁵⁶ Annex 16-1 of Südzucker's reply to the 3rd RFI in Phase II.

²⁵⁷ Annex Q16-7.3.a of Südzucker's answer to the 3rd RFI in Phase II.

6.1.4.3. The effects of the proposed transaction on the Italian sugar market structure

Elimination of competition between Südzucker and EDFM

(i) Role of Südzucker

- (348) Already before the acquisition of 50% of MAXI's capital by Südzucker, Südzucker and MAXI had entered into a cooperation agreement in which Südzucker *inter alia* agreed to supply MAXI with white sugar. However, at that time, Südzucker was not the only supplier of MAXI. MAXI did not produce sugar itself and storage capacities were not necessary due to the lower sugar sales. MAXI's white sugar sales mainly covered northern Italy and industrial processors (beverage, chocolate, biscuits, etc)²⁵⁸. Already in 2006, Südzucker had foreseen the potential benefits from a closer cooperation with MAXI²⁵⁹.
- (349) After the acquisition of 50% of MAXI's capital by Südzucker, MAXI has become Südzucker's [...] sales arm in Italy, following which Südzucker's sales increased in the Italian markets of white sugar to industrial processors and to retailers.
- (350) MAXI currently has [...] storage facilities in [...] ([...] tonnes), [...] ([...] tonnes), [...] ([...] tonnes) and [...] ([...] tonnes). According to Südzucker, stocks are used for packed goods and the facilities are currently used [...] ²⁶⁰.
- (351) The following maps indicate for 2011 the areas served by each of MAXI's storage facilities in [...] ²⁶¹:

[...] ^{*}

The following table shows the distance of deliveries for each of MAXI's storage facilities: ²⁶²

[...] ^{*}

- (352) According to Südzucker, sugar storage has two main purposes: (i) bringing sugar into sales areas during campaign periods (external warehousing), and (ii) ensuring continuous deliveries to clients. The extent to which Südzucker uses external warehousing during campaign periods for bringing sugar into the sales areas depends on the produced quantity. Security of supply is one of the main characteristics industrial processors and retailers seek from suppliers ²⁶³.
- (353) Südzucker's strategy for ensuring security of supply for its customers in Italy is based on two pillars: (i) sufficient storage facilities, and (ii) sound allocation of sales and required stock levels to a specific destination ²⁶⁴.

²⁵⁸ Südzucker's answer to Question 1 of the 3rd RFI in Phase II.

²⁵⁹ Annex 23 of Südzucker's answer to the 2nd RFI in Phase I, at page 13.

²⁶⁰ Südzucker's answer to Question 5 of the 3rd RFI in Phase II.

²⁶¹ Annex 5-1 of Südzucker's answer to the 3rd RFI in Phase II.

²⁶² Südzucker's answer to Question 8 of the 3rd RFI in Phase II.

²⁶³ Südzucker's answers to Questions 12 and 30 of the 3rd RFI in Phase II.

²⁶⁴ Südzucker's answer to Question 29 of the 3rd RFI in Phase II.

- (354) In order to ensure continuous supply to customers, Südzucker works with an average stock in Italy that covers approximately [...] weeks of sales, i.e. around [...] tonnes. This quantity is split into [...] tonnes packed goods (circa [40-50]%) and [...] tonnes bulk (circa [60-70]%)²⁶⁵.
- (355) Moreover, Südzucker is perceived by other sugar producers/suppliers as an aggressive competitor in Italy. In that regard, [large sugar producer] stated: *"since the Italian sugar market is significantly deficit, it should have normally attracted new players. However, [large sugar producer]* believes that MAXI, Südzucker's distributor in Italy, may have managed to deter potential entrants by significantly reducing its prices during the last 3 to 4 years in Italy. It appears that Südzucker via MAXI were selling at lower prices in Italy than in surplus markets in the last few years. Normally, the market price in Italy should reflect the high transport costs involved when sugar is imported into the Italian market from France, Germany and the United Kingdom. However, MAXI's prices in Italy during the last couple of years were lower than the ones in the abovementioned countries. [...] [large sugar producer]* believes that the competitors of MAXI could not follow its example since this strategy would not be economically viable for them. Therefore, there is a risk that once all players are driven out of the market, MAXI would be able to increase its prices higher without facing any competitive constraint"*²⁶⁶. In addition, [another large sugar producer]* stated: *"Tate & Lyle had not enough raw sugar to supply their refineries. Nordzucker concentrated its commercial action in North of Europe, given the fixed quantity at their disposal and the low level of pricing in Italy not sufficient to cover logistic costs to arrive in Italy. However, we can assume that the dumping were made in that period by Südzucker was aimed to discourage the competitors to play in Italy"*²⁶⁷.
- (356) Following this expansion strategy in the Italian market illustrated by the acquisition of MAXI and the subsequent increase of market presence in Italy, Südzucker has managed to become the market leader in the market for white sugar for industrial processors and currently manages to sell approximately [...] tonnes of white sugar per year in Italy of which [...] tonnes to industrial processors.

(ii) *Role of EDFM and the Brindisi refinery*

(a) *EDFM*

- (357) EDFM entered the Italian market as a producer of white sugar through its SRB joint-venture with SFIR. The background of the business decision to establish SRB was the reaction to the effects of the 2006 sugar market reform in Italy. As explained above, between 2006 and 2008, Italy gave up 67% (1,049,000 tonnes/year), of its 2005 quota, which amounted to 1,557,000 tonnes/year. As a result, 15 out of 19 beet factories in Italy had to close. Facing a relatively stable demand for white sugar and the limited Italian beet quota, the four remaining beet sugar factories in Italy (located

²⁶⁵ Südzucker's answer to Question 12 of the 3rd RFI in Phase II.

²⁶⁶ Minutes of the conference call with [...] on 30 November 2011.

²⁶⁷ [...] reply to question 60 of the Questionnaire to sugar producers/suppliers in Italy.

in San Quirico (Parma), Minerbio, Termoli and Pontelongo) could not satisfy demand²⁶⁸.

(b) *EDFM and SFIR partnership*

- (358) In the past, SFIR was one of the historical Italian beet sugar producers²⁶⁹ in need of a reorientation of its business after the closure of its sugar production. EDFM was part of the dissolved EuroSugar joint-venture, a sugar distribution joint-venture operating between 2007 and 2009. EDFM and SFIR, thus decided to establish an Italian refinery to process raw cane sugar. EDFM assumed a strategic role in the supply of raw cane to the refinery, whereas SFIR had the customer relations and knowhow to serve the Italian market.
- (359) The main business consideration behind the Brindisi project was precisely the large Italian deficit, in particular in the South of Italy. According to the project plans, the refinery would supply customers within a radius of [...] km covering [20-30]*% of the Italian domestic consumption²⁷⁰. On this business *rationale* EDFM and SFIR built up the Brindisi refinery, which started operating in December 2010.

(c) *Production capacity of the Brindisi refinery*

- (360) EDFM's internal documents of 2007 and 2009 indicate that SRB would have a maximum capacity of [...] tonnes per year and that SRB would reach a production of: (i) under a worst-case scenario [...] tonnes/year, (ii) under a base-case scenario [...] tonnes/year, and (iii) under a best-case scenario [...] tonnes/year.²⁷¹ A further internal document of 2009 plans EDFM's and SFIR's strategy in Italy on the assumption that SRB will be producing [...] tonnes per year²⁷².
- (361) The Brindisi refinery is the second largest raw cane sugar refinery in the Union with a maximum capacity of [...] tonnes²⁷³. In 2011, the projected production for the refinery was around [...] tonnes to industrial processors and [...] tonnes to retailers covering roughly [20-30]*% of the entire Italian sugar demand²⁷⁴.
- (362) Contrary to all the above mentioned internal documents, in the second phase the Parties suddenly claimed that EDFM had reduced its planned production for the Brindisi refinery to [...] tonnes/year²⁷⁵. However, EDFM was unable to submit internal documents that could substantiate its allegedly modified estimation for a production of [...] tonnes instead of [...] tonnes per year (under the base-case

²⁶⁸ "Information Memorandum" and "Competitive Analysis of supplying Sugar to the Italian Market" submitted as Annexes 4 and 5.b of EDFM's answer to the 2nd RFI in Phase I.

²⁶⁹ SFIR owned and operated four sugar beet factories in Italy prior to the sugar reform.

²⁷⁰ "Information Memorandum" and "Project Overview" submitted respectively as Annexes 4 and 5.a of EDFM's answer to the 2nd RFI in Phase I.

²⁷¹ "Information Memorandum" and "Project Overview" submitted respectively as Annexes 4 and 5.a of EDFM's answer to the 2nd RFI in Phase I.

²⁷² "Competitive Analysis of supplying Sugar to the Italian Market" submitted as Annex 5.b of EDFM's answer to the 2nd RFI in Phase I.

²⁷³ Form CO, p. 135 and answer to the 2nd RFI to EDFM of 27 September 2011, "Information Memorandum SFIR/ED&F Man Brindisi Project" of 4 June 2009.

²⁷⁴ Form CO, p. 27.

²⁷⁵ Südzucker's reply to the Commission's Decision under Article 6(1c) of the Merger Regulation, paragraph 15.

scenario) by the Brindisi refinery²⁷⁶. On 2 December 2011, the Parties submitted a paper²⁷⁷ claiming that in reality the Brindisi refinery could only produce up to [...] tonnes per year.

- (363) In view of the above and taking into account the base-case scenario as well as the paper submitted on 2 December 2011, the production of the Brindisi refinery should be at least [...] tonnes per year in the future.

(d) *Supply area of Brindisi*

- (364) The Brindisi refinery will not only be a substantial relief for the South of Italy, where there are no other sugar factories at all but according to internal documents of EDFM made in preparation of the refinery²⁷⁸, [Description of SRB's supplies]*.

(e) *Storage facilities*

- (365) The main Italian distribution hubs for the Brindisi refinery are the four former (no more operational) sugar beet factories of SFIR located in Forlimpopoli (close to Ravenna), in San Pietro in Casale (close to Bologna), in Pontelagoscuro (close to Ferrara) and Foggia in the South of Italy²⁷⁹. SRB also owns white sugar storage facilities in Brindisi with capacity of [...] tonnes²⁸⁰. The following table and map²⁸¹ show SFIR's (rented or owned) storage facilities, which are used to store white sugar from the Brindisi refinery:

[...]*

- (366) The locations of these storage facilities cover the whole Italian market from North to South. EDFM acknowledges that SFIR has maintained a good distribution network and the necessary structures (storage and packing facilities), relationships and customer contacts in Italy²⁸².

- (367) [Description of SRB's supplies]*. These storage facilities enable SFIR to minimize time of delivery and to offer better service to the final customer. SFIR considers such storage facilities as very important, in order to deliver bulk sugar to final customers and to feed packaging facilities. [Description of SRB's supplies]*²⁸³.

(f) *Perception by competitors and customers*

- (368) With regard to SFIR, respondents have largely emphasized the competitive advantage linked to the Brindisi refinery in terms of access to input (raw cane sugar),

²⁷⁶ Südzucker's answer to Question 15 of the 3rd RFI in Phase II.

²⁷⁷ "Brindisi capacity paper" submitted by EDFM on 2 December 2011.

²⁷⁸ "Competitive Analysis of supplying Sugar to the Italian Market" submitted as Annex 5.b of EDFM's answer to the 2nd RFI in Phase I. Zuccherificio del Molise is located in the centre of Italy and in any event only has a limited capacity of approximately 85,000 tonnes/year.

²⁷⁹ "Information Memorandum" submitted as Annex 4 of EDFM's answer to the 2nd RFI in Phase I.

²⁸⁰ Annex 5 of EDFM's answer to the 2nd RFI in Phase II.

²⁸¹ SFIR's answers to Questions 17 and 18 of the 2nd RFI in Phase II.

²⁸² "Information Memorandum" submitted as Annex 4 of EDFM's answer to the 2nd RFI in Phase I.

²⁸³ SFIR's answers to Questions 22 and 25 of the 2nd RFI in Phase II.

geographic position of the refinery²⁸⁴ or the excellent established customer relationship of SFIR²⁸⁵. Besides, according to an internal document on the competitive analysis of supplying sugar to the Italian market, it is acknowledged that Brindisi has a "*EUR [...]** logistic premium to the average of imported and Italian beet supplied sugar"²⁸⁶.

(iii) *Closeness of competition between Südzucker and EDFM*

- (369) The main competitors of Südzucker and EDFM, as identified in the reconstructed market shares table in recitals (336) and (337) of this Decision, have their storage facilities located in the north of Italy, such as Eridania and COPROB, or do not have any, like Tereos.
- (370) On the contrary, as analysed above, both Südzucker and EDFM have storage facilities and make sales of white sugar to industrial processors and to retailers in the whole territory of Italy. Südzucker and EDFM are geographically close competitors in the sense that they operate in the same areas in Italy. The following two maps illustrate the sales activities and storages for Südzucker and for EDFM/SFIR respectively²⁸⁷:

[...]*

- (371) The proposed transaction would thus bring together two of the largest Italian suppliers with nation-wide presence, contrary to their main competitors. Post-transaction, the new entity would no longer be exposed to the competitive constraint they exercised to each other. Absent the proposed transaction, the recently introduced SRB could offer a competitive alternative to Südzucker (due to its logistics cost advantage and stable supply) in the Italian market for the supply of white sugar to industrial processors.

(iv) *Post-transaction Südzucker and EDFM would have the incentive and ability to withdraw quantities and raise prices in Italy*

- (372) Südzucker and EDFM post-transaction would have the incentive and ability to withdraw quantities from Italy, thereby raising prices.
- (373) Indeed, the proposed transaction would bring together the two most dynamic and fastest growing players in Italy as analysed above and further explained below.
- (374) Also, as admitted by Südzucker and as stated in its internal documents, Südzucker has a clear commercial strategy [Südzucker's strategy]*. Südzucker has increased its

²⁸⁴ Reply by Tate & Lyle (2011/132417) (reply to question 53) (Non-Confidential Version – Questionnaire to sugar suppliers / producers Italy – Phase II).

²⁸⁵ Reply by COPROB (2011/132649) (reply to question 51) (Non-Confidential Version – Questionnaire to sugar suppliers / producers Italy – Phase II).

²⁸⁶ Annex 5.b of EDFM's reply to the 2nd RFI in Phase I, p.13.

sales volume from approximately [...] tonnes in 2008²⁸⁸ to approximately [...] tonnes in 2010²⁸⁹:

[...]*

- (375) As shown in the Commission's reconstructed table of market shares²⁹⁰, today Südzucker is the biggest player in Italy with at least [30-40]*% of the market for sales of white sugar to industrial processors. However, most importantly, Südzucker is able to reduce the quantities it sells in Italy either by reallocating part of these quantities to other Member States or by increasing its stocks of white sugar. Südzucker can easily reallocate sugar from Italy to other Member States, since it benefits from the highest quota in the Union of approximately [...] million tonnes per year²⁹¹, which amounts to around [...] of total sugar quota production in the Union. Südzucker's internal documents indicate that [Südzucker's strategy]*²⁹².
- (376) On the other hand, with a realistic future production of at least [...] tonnes²⁹³, the Brindisi refinery has produced [...] tonnes during the first ten months of 2011²⁹⁴, and it is expected to produce [...] tonnes in 2012, according to internal documents²⁹⁵. Therefore, only in its first year, the Brindisi refinery represents approximately [10-20]*% of the market for the supply of white sugar to industrial processors in Italy²⁹⁶. In the absence of the proposed transaction, the Brindisi refinery would have both the ability and the incentives to supply an even larger part of the Italian market, [Description of SRB]*. The following graph depicts the quantities produced by the Brindisi refinery (i) in the first ten months of 2011, (ii) in campaign year 2011/2012, (iii) under the worst-case scenario of production, (iv) under the base-case scenario of production, (v) under the best-case scenario of production, and (vi) in terms of theoretical capacity, as analysed in recitals (361) to (364) of this Decision.

[...]*

- (377) Also, in the market for sales of white sugar to industrial processors, the closest competitors in terms of size would be significantly smaller than the merged entity, with market shares of around [10-20]*%.
- (378) In the internal documents preparing the proposed transaction, EDFM and SFIR themselves analyze their competitors²⁹⁷. They indicate that [Description of SRB's supplies]*²⁹⁸ [...] ²⁹⁹.

²⁹⁵ Excel table entitled "The Brindisi Project", provided in EDFM's reply to Question 1 of the 4th RFI in Phase I.

²⁹⁶ See recital (336) of this Decision.

²⁹⁷ Answer to the 2nd request for information to EDFM of 27 September 2011, "ED & F Man and SFIR S.p.A – Competitive Analyses of Supplying to the Italian Market" p. 13-19.

²⁹⁸ *Ibid*, at pp.13 and. 17.

- (379) As the stability of the demand in Italy and the responses of market participants indicate, for all the customers sugar is a crucial input product, therefore security of supply is essential and demand is inelastic. Respondents systematically see Brindisi as an important improvement for the Italian sugar market holding significant competitive advantages in terms of its position, infrastructure and access to preferential raw cane sugar.
- (380) Indeed, in the absence of the Brindisi refinery, Südzucker and other suppliers from northern Italy and Member States north of Italy would not face any significant competitive constraint from the South in setting their commercial strategy in Italy, including pricing. Moreover, when the Brindisi refinery will reach its maximum production capacity, it will alone be able to supply approximately [30-40]*% of the current Italian deficit (approximately 1 million tonnes/year). Since white sugar for industrial processors is a homogeneous product, where the quantity supplied determines its final price, the additional quantities expected in the near-future from the competitive Brindisi refinery will play an important role in the determination of white sugar prices in Italy.
- (381) The maps below³⁰⁰ taken from the preparatory documents of EDFM before investing in the Brindisi refinery, reflect the supply patterns and logistics costs in Italy before the start of production in the Brindisi plant and the predictions for after that moment. They illustrate that the refinery has a strong logistics cost advantage over its competitors and could strongly reduce logistics costs in the South of Italy, including Sardinia and Sicily (from EUR [...]*/tonne previously to EUR [...]*/tonne with the Brindisi refinery), but also in the North of Italy (overall logistics costs to supply Italy falls from EUR [...]*/tonne to EUR [...]*/tonne).

Trade flows and transport costs for sugar in Italy prior the start of production of the Brindisi refinery

[...]*

Predicted trade flows and transport costs for sugar in Italy after the inauguration of the Brindisi refiner

[...]*

- (382) Another internal document also demonstrates the effects of the sugar supplies in Italy indicating that [Description of SRB's supplies]*³⁰¹.

[...]*

- (383) According to an EDFM internal document analysing the Italian market and the Brindisi project, [Description of SRB's supplies]*.³⁰²

²⁹⁹ *Ibid*, at p. 17.

³⁰⁰ 2nd request for information to EDFM of 27 September 2011, "Information Memorandum SFIR/ED&F Man Brindisi Project" of 4 June 2009.

³⁰¹ Answer to the 6th request for information to EDFM of 11 October 2011, internal document on "Italian Market" (undated), slide 12.

³⁰² Answer to the 2nd request for information to EDFM of 27 September 2011, "ED & F Man and SFIR S.p.A – Competitive Analyses of Supplying to the Italian Market" p. 12.

- (384) Furthermore, the Brindisi refinery has secured approximately [...] tonnes of raw cane sugar per year [...] through the three contracts mentioned at recital (303) of this Decision, as also confirmed by the Parties. In particular, the [Supplier A] contract has secured [...] tonnes per year [...], whereas the [Supplier B] and [Supplier C] contracts have together secured [...] tonnes per year [...]. These contractually secured quantities of raw cane sugar are an important element towards SRB's base-case scenario production of [...] tonnes of white sugar per year.
- (385) The analysis in another document also shows that SRB can ensure substantially lower transport costs than imports from France or Germany³⁰³:
- [...]
- (386) Therefore, in the absence of the proposed transaction there would be intense competition in Italy between Südzucker and the Brindisi refinery and the latter would bring even stronger competition in the future [...].
- (387) However, post-transaction Südzucker would have negative control over EDFM, which in turn controls the Brindisi refinery jointly with SFIR. Therefore, the merged entity could exercise negative decisive influence over the commercial policy and the strategic decisions of the Brindisi refinery, irrespective of SFIR's position. In fact, the merged entity would have a veto right with respect to decisions and plans of the Brindisi refinery that could impose competitive constraints upon Südzucker in Italy.
- (388) Parent companies can generally be presumed to have an incentive to co-ordinate their competitive behaviour in the decision-making process of the respective company when it is likely to be profitable and thus economically rational. There are many factors which could influence the incentives of the parents to compete outside the joint venture. The most important factor is the joint venture's ownership and control structure. Under the assumption of rational economic behaviour, the greater the parent's stake in the joint venture, (i) the less likely the parent is to compete with it, and (ii) the easier it is for the parent to control the joint venture. In that regard, the acquisition or strengthening of significant market power is relevant, as the ability to raise prices or exclude competitors, on their own or together with third parties, will most likely eliminate the incentive to compete.
- (389) As a result of the proposed transaction, the merged entity will benefit from a dominant position in the market for white sugar to industrial processors in Italy reinforcing the risk of co-ordinate the competitive behaviour between the parent companies.
- (390) Also, the merged entity could compensate SFIR for any short-term loss of revenue caused by a decision to withhold quantities of sugar from being sold on the Italian market. In the long run, SFIR would in all probability not object to such practices if they lead to higher sugar prices, as the merged entity and SFIR would thus achieve joint profit maximisation.

³⁰³ EDFM's reply to the 6th request for information of 11 October 2011, internal document on "Italian Market" (undated), slide 12.

- (391) Given the above, in the absence of the proposed transaction the Brindisi refinery would bring significantly stronger competition to the largest deficit market in the Union, Italy. On the contrary, post-merger the competitive force exercised by the Brindisi refinery in the Italian market for the supply of white sugar to industrial processors would disappear.

Other competitors currently active in Italy are unlikely to increase supply if prices increase

- (392) In accordance with the Horizontal Merger Guidelines, when market conditions are such that the competitors of the merging parties are unlikely to increase their supply substantially if prices increase, the merging firms may have an incentive to reduce output below the combined pre-merger levels, thereby raising market prices³⁰⁴. A merger such as the proposed transaction leading to a significantly increased market shares increases the incentive to reduce output by giving the merging firms a larger base of sales on which to enjoy higher margins resulting from an increase in prices induced by the output reduction³⁰⁵.
- (393) If market conditions are such that competitors do not have enough capacity and do not find it profitable to expand output significantly, the Commission is likely to find that the merger will create or strengthen a dominant position or otherwise significantly impede effective competition³⁰⁶.
- (394) In other words if competitors have the ability and incentive to significantly increase their supplies and market shares in reaction to a price increase, the merger should not raise competition concerns³⁰⁷.
- (395) In this context, such output and market share expansion is in particular unlikely when competitors face binding capacity constraints and the expansion of capacity is costly or if existing excess capacity is significantly more costly to operate than capacity currently in use³⁰⁸. At the same time, it should be also pointed out that "*[n]on-merging firms in the same market can also benefit from the reduction of competitive pressure that results from the merger, since the merging firms' price increase may switch some demand to the rival firms, which in turn, may find it profitable to increase their prices*" and the "*reduction in these competitive constraints could lead to significant price increases in the relevant market*"³⁰⁹.
- (396) This section therefore analyses the positioning of each competitor of the Parties in the market for supply of white sugar to industrial processors in Italy and examines in particular whether they (a) are in a position and (b) have incentive to increase their sugar supplies on the Italian white sugar market for industrial processors in case of price increase³¹⁰.

³⁰⁹ Paragraph 24 of the Horizontal Merger Guidelines.

³¹⁰ The Horizontal Merger Guidelines.

(i) Lack of ability or incentive for competitors of Südzucker and EDFM to expand in Italy: assessment of generally prevailing market conditions

- (397) The Italian sugar market is characterized by low production capacities due to fixed limited white sugar production quotas, therefore Italian competitors, including [...]*, [...]* and [...]*, are capacity constrained. Indeed, half of the Italian white sugar demand (1.73 million tonnes/year³¹¹) is satisfied from domestic production fixed on the basis of the Italian production quota (855,000 tonnes/year)³¹². Therefore, the Italian white sugar market is highly import dependent since half of its domestic consumption has to be satisfied from imports. At the same time, the sugar stocks in the Union are very low³¹³ and significant shortage of access to preferential raw cane sugar is commonly known by the industry³¹⁴. All these elements taken together significantly limit the ability of sugar producers that are already established in Italy to reallocate capacities in Italy.
- (398) Therefore, in response to a price increase, those producers would have to reallocate white sugar quantities which are in principle destined to already existing customers in other Member States. Therefore, such reallocation of sugar quantities would be quasi impossible without withdrawing sugar from other customers with whom the producer has already a well-established relationship. That is different from the 2005/2006 market conditions where surplus country producers with stocks were in a position to reallocate quantities without disrupting already existing customer relationships³¹⁵.
- (399) In particular, in times of scarcity other significant European players with sales organisations in the Italian market such as [...]*, [...]* and [...]*, have limited capacities and also no incentives to redirect substantial additional sugar quantities from other Member States to Italy on the basis of the elements above and below. In addition, such reallocation of quantities would also imply additional transport costs leading to lower margins for sales in Italy than for sales in the country of origin of the white sugar.
- (400) Reallocation of sales with a view to expanding market shares in Italy would also entail the risk that Südzucker will protect its market shares in Italy in a selective manner as it is in a position to do so, in particular post-merger, by giving selective and pre-emptive price reductions to those customers which a supplier would like to acquire.
- (401) A further factor which needs to be taken into account is that a failure of an expansion strategy on the Italian market would entail high costs, because it requires to accept for the additional quantities low prices and thus margins, transport costs to bring the sugar from abroad and the loss of high margins in the country of origin. According to

³¹¹ Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 12, sent by e-mail of 1 December 2011 (19:33).

³¹² Production capacities of [...]*

³¹³ Recital 2 of Commission Regulation (EU) No 222/2011 of 3 March 2011 laying down exceptional measures as regards the release of out-of-quota sugar and isoglucose on the Union market at reduced surplus levy during marketing year 2010/2011 (OJ L 60, 5.3.2011, p. 6).

³¹⁴ See recitals (69) to (73) of this Decision.

³¹⁵ Reply by [...]* (reply to questions 7 and 8) (Non-Confidential Version – Questionnaire to [...]* – Phase II) (received by e-mail of 9 January 2012 at 18:15).

the Horizontal Merger Guidelines high risks and high costs of failed entry or expansion make entry or expansion less likely³¹⁶.

- (402) Last but not least, [...]*, [...]*and [...]* all indicated to the Commission that they will not expand their white sugar supplies in Italy even in reply to a price increase.
- (403) Against this background, in paragraph 181 of its reply to the SO, the notifying party argued the following: "*[t]he fact that producers are capacity constrained does not mean that they will not sell more sugar to industrial customers in Italy if there is a permanent price increase as postulated by the Commission's theory of harm. The postulated higher Italian sugar prices resulting from withholding of volumes will necessarily change the incentives of the sugar producers and suppliers in Europe – sales to industrial customers in Italy will be relatively more profitable making it profit-maximising for producers to commence sales in Italy or to divert a higher proportion of their sales to Italy*".
- (404) [...]*³¹⁷ [Description of Südzucker's market strategy]*.
- (405) [Description of Südzucker's market strategy]*. The analysis of Südzucker stops there, however as explained above, on top of the high risk of losing home market customers and facing additional transport costs, as rightly pointed out by Südzucker, a re-allocation of sugar quantities to Italy would also imply the risk of facing an incumbent operator who would protect its market shares in a selective manner by offering long-term contracts or giving targeted pre-emptive price reductions to those customers that the given supplier would try to acquire³¹⁸. That would lower the profitability of such sugar reallocation, and is especially relevant for the Italian sugar market where such market behaviour has already taken place.
- (406) Indeed, [a large Italian sugar producer]* indicated to the Commission in the following terms that "*Tate & Lyle had not enough raw sugar to supply their refineries. NZ concentrated its commercial action in North of Europe, given the fixed quantity at their disposal and the low level of pricing in Italy not sufficient to cover logistic costs to arrive in Italy. However we can assume that the dumping [was] made in that period by SDZ was aimed to discourage the competitors to play in Italy*". [a large sugar producer]* took the view that "*[f]urthermore, since the Italian sugar market is significantly deficit, it should have normally attracted new players. However, [a large sugar producer]* believes that MAXI, Südzucker's distributor in Italy, may have managed to deter potential entrants by significantly reducing its prices during the last 3 to 4 years in Italy. It appears that Südzucker via MAXI were selling at lower prices in Italy than in surplus markets in the last few years. Normally, the market price in Italy should reflect the high transport costs involved when sugar is imported into the Italian market from France, Germany and the United Kingdom. However, MAXI's prices in Italy during the last couple of years were lower than the ones in the abovementioned countries*"³¹⁹.

³¹⁶ Paragraph 69 of the Horizontal Merger Guidelines.

³¹⁷ Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 15, sent by e-mail of 1 December 2011 (19:33).

³¹⁸ Paragraph 69 of the Horizontal Merger Guidelines.

³¹⁹ Reply by [...]* ([...]*) (reply to question 60) (Non-Confidential Version – Questionnaire to sugar suppliers / producers Italy – Phase II) and Non-confidential version of the Minutes of the

- (407) In paragraph 148 of its reply to the SO the notifying party qualifies these quotes being "*anecdotes*" by simply objecting that "*many other European sugar producers had expansion strategies and directed significant quantities of sugar to Italy*" before however qualifying these anecdotes "*evidence*" which would reflect "*the existence of functioning competition*".
- (408) Also, during the Hearing of 5 March 2012, the notifying party produced a table³²⁰ with Südzucker's national average invoiced sugar prices [Information about Südzucker's prices in Italy between 2006/2007 and 2010/2011]*. In this respect, the notifying party explains that such strategy only took place because during the transitional period from the old regime to the full effects of the 2006 sugar regime Südzucker had surplus sugar to reallocate in other Member States. [Information about Südzucker's prices in Italy between 2006/2007 and 2010/2011]*. In addition, competitors without stocks could not engage in such strategy which resulted in an increase of Südzucker's market shares on the Italian white sugar markets to the detriment of its direct competitors. Therefore, Südzucker cannot validly argue that evidence of its aggressive market behaviour is only an "*anecdote*" and that competition for market shares did not take place in Italy.
- (409) As for the replies by the competitors whether they would expand in Italy as a reaction to a sugar price increase as a result of the proposed transaction, the notifying party takes the view in its reply to the Statement of Objections that the question in the questionnaire sent to the competitors in Phase II was not precise enough and that the replies of the competitors were flawed as they replied to leading questions in some instances.
- (410) As for the irrelevance of the question in the questionnaire³²¹, the notifying party argued in this respect in its reply to the SO that reference should be made to the two years period as provided for in Paragraph 74 of the Horizontal Merger Guidelines and that price increase should be "*permanent*". However, Paragraph 74 of the Horizontal Merger Guidelines relates to "*entry*" of new competitors and not "*expansion*" of existing competitors and the Horizontal Merger Guidelines do not require the use of reference to a "*permanent*" price increase.
- (411) Also, in its criticism³²² the notifying party overlooks the fact that several follow-up questions were addressed to competitors on that very issue. Indeed, more precise answers were obtained in the course of the follow-up questions. Reference to such exchanges is widely reflected in the Statement of Objections and this Decision.
- (412) As for [a large Italian sugar producer]* for example references to these exchanges are made in footnotes 224, 245, 247 or 248 of the Statement of Objections or the non-confidential version of the Minutes of the conference call with [a large sugar producer]* on 30 November 2011. Concerning [a large Italian sugar producer]*, reference is also made to footnote 265 of the Statement of Objections or the non-

Teleconference with [...] of 30 November 2011, e-mail of Mr [...] of 9 January 2012, at 14:18, paragraphs 4 and 5.

³²⁰ Slide 13 of the presentation by [...] of 5 March 2012, entitled "Effects of the Transaction on the White Sugar Market".

³²¹ Paragraphs 167 – 169 and 175 of the reply of the notifying party to the Statement of Objections.

³²² Paragraphs 172 – 173 of the reply of the notifying party to the Statement of Objections.

confidential version of the Minutes of the Teleconference with [a large sugar producer]* on 8 December 2011. With regard to [a large sugar producer]* reference is made to footnotes 291 or 292 of the Statement of Objections or a specific questionnaire with 10 questions on the ability and incentives of [a large sugar producer]* to expand in the Italian white sugar market to industrial processors entitled "M.6286 – Südzucker / ED&F Man Questionnaire to [...]* – Phase II" or also the Non-confidential Minutes [...]* – 18 November 2011 and several other exchanges.

- (413) Concerning the alleged leading nature of some questions³²³, it must be borne in mind that replies to the questions about the ability and incentive to expand output in the Italian white sugar markets in case of price increases imply highly confidential market strategy information of the competitors subject to the market investigation.
- (414) The Commission has proposed summaries of the confidential information provided by the respondents to them in order for them to be able to agree to the non-confidential summaries being used for the purposes of the investigation. Therefore, the indications by the Commission did not constitute a question on a stand-alone basis but only the non-confidential summary of the confidential answers of the respondents already obtained beforehand.
- (415) Therefore, on the basis of the market investigation, it is concluded that white sugar producers / suppliers would have limited ability and no incentive to expand their white sugar supplies in the market for supply of white sugar to industrial processors in Italy post-merger even in response to a price increase.

(ii) *Eridania / Tate & Lyle / Cristal Union*

(a) *The notifying party*

- (416) According to the notifying party³²⁴, Eridania (Eridania Italia S.p.A.) is one of the incumbent Italian beet sugar manufacturers with two beet factories producing 275,000 tonnes per year. As one of the incumbent Italian beet sugar manufacturers, Eridania has expert knowledge of the Italian market, good client contacts and distribution network. It furthermore profits from being an Italian company, providing a "local touch" for certain customers. In order to maintain its historically strong position on the Italian market despite the reduction of its beet production, Eridania is sourcing sugar from inside and outside the Union. Eridania had a cooperation agreement in place with Tate & Lyle and is now tied to Cristal Union, one of the major French sugar beet manufacturers (the envisaged³²⁵ acquisition of Groupe Vermandoise would make Cristal Union the fifth largest sugar producer in the Union). According to the notifying party, that cooperation agreement will help Eridania get significant sugar supplies from France and is intended to "*reinforce the leadership position of Eridania in Italy and maintain its strong position vis-à-vis*

³²³ For example Paragraphs 189, 194 or 199 of the reply of the notifying party to the Statement of Objections.

³²⁴ Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 21, sent by e-mail of 1 December 2011 (19:33).

³²⁵ The "*protocole d'accord*" was signed on 7 January 2012 ("<http://www.cristal-union.fr/1157/conclusion-d%e2%80%99un-protocole-d%e2%80%99accord-avec-cristal-union-pour-l%e2%80%99acquisition-du-controle-du-groupe-vermandoise/>")

industrial clients". The notifying party has also put forward that both Eridania and Cristal Union have significant refinery projects in the pipeline. Cristal Union builds a refinery in Algeria which is expected to start operations in mid-2012 while Eridania announced in April 2011 an agreement with Kenana Sugar Company of Sudan to build a major sugar refinery in Sudan with an initial capacity of 500,000 tonnes of raw sugar which is planned to reach 1 million tonnes in the future. The notifying party suggests that the realisation of the Sudan project³²⁶ will enable Eridania to source for the Italian market within the LDC/ACP preference framework and compete with sugar of Sudan origin in the Italian market.

(b) *Historical background*

- (417) Eridania is a historical operator on the Italian white sugar market. Currently Eridania has a [...] production facility³²⁷. Following the 2006 sugar reform it concluded a cooperation agreement with Tate & Lyle on 28 March 2007.
- (418) Tate & Lyle had been trading in the Italian sugar market for 20-30 years through a local agent before deciding in 2007 to create a joint venture together with Eridania Sadam³²⁸. However, Tate & Lyle exited the Italian sugar market in 2011³²⁹ as [...] ³³⁰.
- (419) On 7 March 2011 Eridania Italia S.p.A. set up a joint-venture ([...]) with [...], CristalCo³³¹. [Shareholder structure of CristalCo]³³².

(c) *Sources of supply and infrastructure*

- (420) Contrary to the indication by the notifying party, Eridania [...] ³³³ and [...] ³³⁴.

³³⁴ Reply by [...] ([...]) (reply to question 96) (Non-Confidential Version – Questionnaire to sugar suppliers / producers Italy – Phase II).

(d) *Market positioning*

- (421) Despite Eridania's important sales of white sugar in Italy, its commercial focus is strongly placed on the retail market. This is also evidenced by the fact that Eridania has market shares almost [CONFIDENTIAL] times higher in the market for the supply of white sugar to retailers compared to industrial processors. Eridania holds [5-10]*% market share in the market for the supply of white sugar to industrial processors in Italy.

(e) *Perception by Eridania*

- (422) Eridania describes itself very succinctly as a company with infrastructure, national and regional sales offices and established customer relationship³³⁵.

(f) *Perception by competitors*

- (423) [A large Italian sugar producer]* describes Eridania on the Italian white sugar market with good access to input, very good infrastructure, customer relationship and national sales office and partnership with Cristal Union, however without the ability to expand its output on the Italian market in view of fixed limited production quotas and limited access to preferential raw cane sugar³³⁶.
- (424) [A large Italian sugar producer]* also explains that Tate & Lyle exited the Italian white sugar market because it had not sufficient raw cane sugar to supply the Eridania joint venture. At the same time, [a large Italian sugar producer]* considers that Cristal Union entered the joint venture as it has a surplus of sugar as a result of the recent acquisition of Société Vermandoise Industries and it was necessary to channel sugar into deficit and close market such as Italy³³⁷. [A large Italian sugar producer]* also emphasizes that Cristal Union entered the Italian market as it benefits from a surplus under the French sugar beet quota³³⁸ and [A large Italian sugar producer]* left the Italian white sugar market in the absence of enough raw sugar³³⁹. [A large Italian sugar producer]* explains that one of the reasons for Cristal Union's plan to cooperate with Eridania is the deficit situation of the Italian white sugar market³⁴⁰.
- (425) While [a large Italian sugar producer]* claims that competitors (in general) are able to increase the volumes sold in Italy, such increase would necessitate reallocation of volumes sold in other countries or through imports since no increase of production in

³⁴⁰ Reply by [...]* (reply to question 64) (Non-Confidential Version – Questionnaire to sugar suppliers / producers Italy – Phase II).

Italy is possible³⁴¹. [A large Italian sugar producer]* takes the view that Eridania has a fixed quota for beet sugar output and has therefore little flexibility to increase output before adding that at current price levels raw sugar bought on the free market (for example, from Brazil) cannot be sold profitably in the Union because of high duties³⁴². [A large Italian sugar producer]* explains that Italy is a highly deficit country in terms of sugar³⁴³ and states in this respect that no player on the Italian market (including Eridania) is in a position to expand its output in a short period of time as a response to a price increase in view of the fact that "*all the players deal with production quotas which are fixed and with constraints in access to preferential sugar*"³⁴⁴.

(g) *Perception by customers*

- (426) As for customers, [a customer]* indicated that "*ESI/SFIR, MAXI and Italia Zuccheri have more strengths compared to Eridania/Tereos and Zuccherificio del Molise*"³⁴⁵. [A customer]* put forward that Eridania has its own refineries in Italy which constitutes a competitive advantage, however does not have important sugar quantities³⁴⁶. [A customer]* also indicated that Eridania has a favourable geographical situation³⁴⁷. However, [a customer]* indicated that "*Eridania is just a dealer not a producer*"³⁴⁸ while [a large customer]* underlined that Eridania is too small to be competitive on the segment for supply of sugar to industrial processors but has more sugar as a result of the cooperation with Cristal Union but is more present on the retail market via its brand "Zefiro"³⁴⁹.
- (427) Concerning the exit of the Italian white sugar market by Tate & Lyle, [a large customer]* explains that Tate & Lyle left the Italian market because of lack of sugar³⁵⁰. [A large customer]* suggests with regard to Cristal Union's market entry that it is linked to the deficit character of the Italian sugar market with high prices³⁵¹ while [a large customer]* takes the view that with the departure of Tate & Lyle Cristal Union has captured the opportunity to form a joint-venture with Eridania and

³⁵¹ Reply by [...] ([...]) (reply to question 50) (Confidential and Non-Confidential Versions - Questionnaire to sugar customers in Italy – Phase II).

"secure" a straight entry on the market³⁵². In this line, [a large customer]* puts forward that Cristal Union (CristalCo) "*needs to sell its sugar produced in France in other countries*" and Italy constitutes the best option to do it "*in terms of payback*"³⁵³.

(428) In general, Italian customers are very much concerned by the lack of availability of sufficient sugar quantities for Italian sugar producers / suppliers³⁵⁴.

(h) *Assessment*

(429) As already mentioned, it is submitted by the notifying party that both Eridania and Cristal Union have significant on-going refinery project developments. Cristal Union is building a refinery in Algeria which is expected to start operations in mid-2012 while Eridania announced in April 2011 an agreement with Kenana Sugar Company of Sudan to build a major sugar refinery in Sudan with an initial capacity of 500,000 tonnes of raw sugar which is planned to double to 1 million tonnes in the future. According to the notifying party, the realisation of the Sudan project³⁵⁵ will enable Eridania to source for the Italian market, within the LDC/ACP preference framework, and therefore compete with sugar of Sudan origin in the Italian market.

(430) In view of the Commission, the ability and incentives for Eridania/Cristal Union to substantially expand supplies on the market for supply of white sugar in Italy within the timeframe relevant for merger control are unlikely.

(431) As analysed in recitals (398) to (402) of this Decision, the Italian sugar market is production limited, Italian competitors are capacity constrained, sugar stocks in the Union are very low and significant shortage of access to preferential raw cane sugar is commonly known by the industry. In such difficult market conditions of scarcity of sugar, other major players with established presence in Italy such as Cristal Union with its joint venture with Eridania, do not have the capacity and incentives to redirect substantial additional sugar quantities from other Member States to Italy since it would entail commercial risks of losing existing customers, lower margins due to transport costs and the risk of failure of expansion due to the risk of selective reaction of the post-merger entity.

(432) Therefore, competitors such as Eridania and Cristal Union would have limited ability to substantially increase white sugar supplies in Italy post-merger and such strategy

³⁵⁵ Also see Presentation by Südzucker to the Commission on the "Sugar Market in Italy" of 2 December 2011, slide 6 (Sugar Market in Italy Presentation to the Commission (M.6286) Brussels, 2. December 2011).

does not appear to be profitable as it would imply the significant commercial risks to lose existing customers in the country of origin of the sugar, to get lower margins due to transport costs and the high risk of failure of expansion of market share due to the risk of selective reaction of the post-merger entity, Südzucker/EDFM.

- (433) The new Sudanese refinery project for the time being is not precise enough and, as described by Südzucker's presentation³⁵⁶ in the most optimistic scenario the project will not commence operations before 2014. First of all, given the size of the project, its limited stage of advancement and the Sudan related political, legal and economic challenges to respect an ambitious calendar, it is at this stage not certain whether that timeframe is realistic. At this stage it is even uncertain whether the project will be realised at all. In this respect, the Commission notes that the project is still at an early stage [...]*. It must also be borne in mind that in the current economic and financial crisis it is difficult to find financing for a project like this. In addition, the Commission notes that the project has been on hold for several years now. Also, the political and economic environment in Sudan does not guarantee the timely implementation of the project. Therefore, there is uncertainty whether this project will materialise and significant doubts whether, if it does, it will come on-line in 2014. Accordingly, the Sudanese refinery project does not constitute a likely plan in view of the uncertainties surrounding the project and the fact that in the most optimistic scenario it is not foreseen to be in a position to provide white sugar on the Italian market prior to 2014.
- (434) Concerning the Algerian refinery, the Commission notes that, notwithstanding the fact that the project is at an advanced stage and is foreseen to operate as of the end of 2012, importing white sugar from Algeria is subject to world market import duties and is thus not currently an economically viable alternative compared to white sugar imported from LDC/ACP countries. [A large Italian sugar producer]*³⁵⁷ puts forward that the [...]*. [A large Italian sugar producer]* also explains that the [...]*. Consequently, the actual TRQs (exceptional tariff rate quotas) will not allow sufficient white sugar imports [...]* from Algeria³⁵⁸. Therefore, even if the Algerian refinery is operational at the end of 2012, it will have no financial incentive to supply white sugar into Italy and therefore does not constrain the Parties from increasing prices in the Italian white sugar market.
- (435) Moreover, [a large Italian sugar producer]* also indicated that it did not plan [...]* during the next 1-2 years³⁵⁹ and most importantly that "[a large Italian sugar producer]*³⁶⁰ while [a large Italian sugar producer]*³⁶¹ also confirmed to the Commission that it [market strategy]*.

³⁶⁰ E-mail by Mr [...]* of 12 January 2012 at 11/15, Subject: "Rif: M.6286 - Your reply to question 93 of the Questionnaire to sugar suppliers / producers in Italy - Phase II".

³⁶¹ E-mail of Mr [...]* of 11 January 2012 at 15:26 stating that "[...]*".

- (436) Especially as for the ability and incentive of expansion by Eridania/Cristal Union³⁶², the notifying party, in its reply to the Statement of Objections, without mainly putting forward new elements simply reiterates its arguments of the Form CO.
- (437) The only new element is that it takes the view that expansion of supply of white sugar to industrial processors could result from switching from supply of white sugar to retailers to supply of white sugar to industrial suppliers³⁶³ by Eridania who is an important operator in the field of supply of white sugar to retailers.
- (438) However, replies of the market players to new requests for information depict a different picture. Indeed, the new documents and information collected by the Commission, following the reply to the Statement of Objections by the notifying party, confirm the findings of the Statement of Objections in the sense that competitors do not have the ability or incentive to expand their sales to industrial customers in Italy, since it is not even possible or profitable to switch quantities from retail customers to industrial customers.
- (439) In reply to follow up questions sent by the Commission on 16 February 2012, producers/suppliers of white sugar in Italy indicated that they are not able to expand in Italy and they do not have incentives to do so. As to the claimed ability of suppliers/producers to increase quantities available to industrial processors at the expense of supplying the same sugar to retailers, none of these producers/suppliers finds it feasible and profitable to do so, mainly because of (i) the necessity to keep the loyalty of existing retail customers in the long-term, and (ii) the need to maintain low unit costs of sugar sold to retailers in the long-term taking into account the relevant costs, such as the cost of the marketing structure or the cost of the packaging lines³⁶⁴.

(i) *Conclusion*

- (440) On the basis of the above, it is concluded that notwithstanding the fact that Eridania and Cristal Union seem to be well established sugar suppliers on the Italian sugar market, they would have (a) limited ability and (b) no commercial incentives to substantially expand output post-merger in the Italian market for supply of white sugar to industrial processors even in response to a price increase.

(iii) *Italia Zuccheri / Pfeifer & Langen / COPROB*

(a) *Views of the notifying party*

- (441) According to the notifying party, Italia Zuccheri has expert knowledge of the Italian market, good client contacts and a good distribution network, being one of the incumbent Italian beet sugar manufacturers. Being an Italian company provides it furthermore with a "local touch" certain customers are seeking. Italia Zuccheri owns two beet factories producing around 290,000 tonnes. Italia Zuccheri, moreover, has access to imports from within the Union as it has a cooperation agreement with

³⁶² Paragraphs 185 - 191 of the reply of the notifying party to the Statement of Objections.

³⁶³ Paragraph 191 of the reply of the notifying party to the Statement of Objections.

³⁶⁴ The notifying party was informed about it by a Letter of Facts of 14 March 2012 and was provided with the non-confidential versions of the replies of the competitors.

Pfeifer & Langen, Germany's third largest beet sugar producer. To the further extend of release of out of quota sugar by the Commission additional sugar quantities would be available for the commercialisation in the Italian market. Furthermore, Italia Zuccheri and Pfeifer & Langen are building a refinery in Minerbio with a capacity of 150,000 tonnes, which will start operations in February 2012, allowing them to get access to further quantities of sugar for the Italian market³⁶⁵.

(b) *Historical background*

- (442) Italia Zuccheri is a historical operator on the Italian white sugar market. Via COPROB Italia Zuccheri has created a Joint-venture (Italia Zuccheri Commerciale S.r.l.) with Pfeifer & Langen ([shareholder structure of the joint-venture]*) on 27 November 2006 to share the sales in the Italian market. All the sugar quantities of COPROB and of Pfeifer & Langen intended for sale in Italy are sold via Italia Zuccheri Commerciale S.r.l.³⁶⁶.

(c) *Sources of supply and infrastructure*

- (443) Italia Zuccheri currently has two sugar production facilities: Minerbio ([...]* tonnes/year for beet – [...]* - while [...]* tonnes/year for cane) and Pontelongo COPROB ([...]* tonnes/year for beet, [...]*)³⁶⁷. It has sugar storages in Minerbio, Pontelongo, Argelato, Porto Viro, Finale Emilia and Pontelagoscuro³⁶⁸.

(d) *Market positioning*

- (444) Italia Zuccheri / COPROB / Pfeifer & Langen holds [20-30]*% market share in the market for the supply of white sugar to industrial processors in Italy.

(e) *Perception by COPROB*

- (445) COPROB considers that it has good access to sugar, very good infrastructure, very good national sales office with dedicated staff, good regional sales office with dedicated staff, very good established customer relationship and a specific partnership with Pfeifer & Langen³⁶⁹. However, it considers itself less competitive than Südzucker / EDFM in terms of access to input, price making and location to supply north and south of Italy. It also considers that it has less volume than Südzucker / EDFM³⁷⁰.

³⁶⁵ Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 22, sent by e-mail of 1 December 2011 (19:33).

³⁷⁰ Reply by [...]* ([...]* (reply to question 89) (Non-Confidential Version – Questionnaire to sugar suppliers / producers Italy – Phase II).

(f) *Perception by competitors*

- (446) [A large sugar producer]* takes the view that Italia Zuccheri has a fixed quota for beet sugar output and therefore has little flexibility to increase output and at current price levels raw sugar purchased on the free market (for example, from Brazil) cannot be sold profitably in the Union³⁷¹.

(g) *Perception by customers*

- (447) [A large customer]* emphasizes the partnership of Italia Zuccheri with Pfeifer & Langen and the fact that it has the largest Italian production quota and that it will soon start to refine raw sugar which constitutes its most important strength³⁷². [A customer]* indicated in general terms that Italia Zuccheri has more strengths compared to Eridania/Tereos and Zuccherificio del Molise³⁷³ while [a customer]* puts forward that Italia Zuccheri has its own refinery in Italy which constitutes a competitive advantage however it has no important sugar quantities³⁷⁴. [A large customer]* and [a large customer]*³⁷⁵ also underline the fact that the production of Italia Zuccheri is in Italy and the relationship with Pfeifer & Langen³⁷⁶ but, in line with [...]*, it has only small volume quota available (also emphasized by [a customer]*)³⁷⁷.
- (448) As already underlined, in general, Italian customers are very much concerned by the lack of sufficient sugar quantities available for the Italian sugar producers / suppliers³⁷⁸.

(h) *Assessment*

- (449) As already mentioned, the notifying party puts forward that Italia Zuccheri and Pfeifer & Langen have built a refinery in Minerbio with a capacity of 150,000 tonnes, which started operations in February 2012, allowing them to get access to

³⁷⁸ See paragraph (428) of the present.

further quantities of sugar for the Italian market³⁷⁹. The investment adds refining capacity to an existing sugar beet production site.

- (450) In the Commission's view, it is unlikely that Italia Zuccheri / Pfeifer & Langen / COPROB will have the ability and incentives to substantially expand its supplies on the market for the supply of white sugar in Italy within the timeframe relevant for merger control.
- (451) As analysed in recitals (398) and (402) of this Decision, the Italian sugar market is production limited, Italian competitors are capacity constrained, sugar stocks in the Union are very low and significant shortage of access to preferential raw cane sugar is commonly known by the industry. In such difficult market conditions of scarcity of sugar, other major players with established presence in Italy such as Pfeifer & Langen with its joint venture with Italia Zuccheri, do not have the capacity and incentives to redirect substantial additional sugar quantities from other Member States to Italy since it would entail commercial risks to lose existing customers, lower margins due to transport costs and risk of failure of expansion due to risk of selective reaction of the post-merger entity.
- (452) Therefore, competitors such as Pfeifer & Langen and Italia Zuccheri would have limited ability to substantially increase white sugar supplies in Italy post-merger and such strategy does not appear to be profitable as it would imply the significant commercial risks to lose existing customers in the country of origin of the sugar, to get lower margins due to transport costs and the high risk of failure of expansion of market share due to the risk of selective reaction of the post-merger entity, Südzucker/EDFM.
- (453) To the very contrary Pfeifer & Langen would have the incentive to reallocate sugar quantities back to Germany. Indeed, first, the Commission observes significant scarcity of white sugar in the whole Union and also outside Italy. As a result of historically low stocks and scarcity of white sugar, prices have gone up significantly in all Member States³⁸⁰.
- (454) In this context the German NCA, Bundeskartellamt has indicated to the Commission³⁸¹ that the German white sugar market suffers from white sugar scarcity and historically high market prices. This situation could be a first rationale for a market strategy by Pfeifer & Langen to repatriate its current sugar exports to Italy back to Germany or other neighbouring markets where it could for those quantities compete and achieve higher margins on the basis of lower transport costs.
- (455) Also, [a large Italian sugar producer]* has indicated to the Commission that it is not in a position to expand its output in a short period of time in response to a price increase on the Italian white sugar market given (i) the production quota which is

³⁷⁹ Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 22, sent by e-mail of 1 December 2011 (19:33) and Presentation by Südzucker to the Commission on the "Sugar Market in Italy" of 2 December 2011, slide 6 (Sugar Market in Italy Presentation to the Commission (M.6286) Brussels, 2. December 2011).

³⁸⁰ Recital 2 of Commission Regulation (EU) No 222/2011 of 3 March 2011 laying down exceptional measures as regards the release of out-of-quota sugar and isoglucose on the Union market at reduced surplus levy during marketing year 2010/2011.

³⁸¹ Letter of the Bundeskartellamt to Mr [...] of 7 October 2011, (2011/107118).

fixed, and (ii) the constraints on sourcing preferential raw cane sugar. Notwithstanding the increase of its production in 2012 due to the investment made to [...]*,[a large Italian sugar producer]* confirmed that as a matter of organisation of their supplies they will not be able to supply additional quantities in the Italian market post-merger³⁸². Indeed, [a large sugar producer]* indicated to the Commission that "[...]*"³⁸³. The Commission considers that this strategy of reorganisation of supplies makes economic sense in the current market circumstances as described above.

- (456) Especially as for the ability and incentive of expansion by Italia Zuccheri / COPROB / Pfeifer & Langen³⁸⁴, the notifying party, in its reply to the Statement of Objections, without hardly putting forward any new elements simply reiterates its arguments in the Form CO.
- (457) The only new element is that it takes the view that expansion of supply of white sugar to industrial processors could result from switching from supply of white sugar to retailers to supply of white sugar to industrial suppliers³⁸⁵ by Italia Zuccheri who is "*also*" an important operator in the market for the supply of white sugar to retailers.
- (458) However, as analysed in recitals (439) and (440) of this Decision, market players indicated to the Commission that such switch would not be feasible and profitable due to (i) the necessity of keeping the loyalty of existing retail customers in the long-term, and (ii) the need to maintain low unit costs of sugar sold to retailers in the long-term taking into account the relevant costs, such as the cost of the marketing structure or the cost of the packaging lines³⁸⁶.

(i) *Conclusion*

- (459) Therefore, after the analysis of the above, notwithstanding the fact that Italia Zuccheri / COPROB and Pfeifer & Langen seem to be well established sugar producers / suppliers on the Italian sugar market, they would have (a) limited ability, and (b) no commercial incentives to substantially expand output post-merger in the Italian market for supply of white sugar to industrial processors, even in the event of a price increase by the merged entity.

³⁸⁴ Paragraphs 192 - 198 of the reply of the notifying party to the Statement of Objections.

³⁸⁵ Paragraph 198 of the reply of the notifying party to the Statement of Objections.

³⁸⁶ The notifying party was informed about it by a Letter of Facts of 14 March 2012 and was provided with the non-confidential versions of the replies of the competitors.

(iv) *Tereos*

(a) *Views of the notifying party*

- (460) According to the notifying party, French sugar producer Tereos plays and will continue to play a significant role in Italy. It has gone into a different direction than other sugar producers by having established its own sugar marketing company in Italy. Tereos belongs to the group of five beet sugar producers that according to the Commission account for a combined 80% of the sugar beet processing capacity and 72% of the Union sugar market. Furthermore, Tereos has strong links to a number of raw cane exporting countries, such as Mozambique. This access to sugar combined with a network of local distribution companies in Italy would enable Tereos to readily increase its LDC/ACP supply to Italy in case Südzucker/ESI would increase their prices in Italy following completion of the proposed transaction³⁸⁷.
- (461) Südzucker believes that Tereos is delivering 40% to wholesalers (instead of 20% like the others) because Tereos has established its own marketing company while the other big sugar producers entered into cooperations with local companies, in most cases with a local producer. Absent long-established local contacts, the notifying party considers that it should be more difficult for Tereos to build up and develop a client network in industry and retail. To reach its sales volume, Tereos will therefore probably have to rely to a much greater extent on sales to wholesalers³⁸⁸.

(b) *Historical background*

- (462) Tereos is a cooperative agro-industrial group, specialized in the production and supply of sugar, alcohol, bio-ethanol, sweeteners and by-products. Tereos is mainly a producer of sugar. Tereos sells industrial sugar in almost all Member States while its sales of retail sugar are geographically more restricted³⁸⁹. Tereos Group, which is active at European level, created in 2006/2007 "Tereos Italy", its own commercial office in Milan to facilitate its business in Italy with a [...] sales organisation. This new entity is in charge of the contacts with local customers of Tereos Group and sales in Italy are conducted through it³⁹⁰.

(c) *Sources of supply and infrastructure*

- (463) Tereos has no sugar factory or refinery in Italy and Tereos supplies the Italian market via its sugar factories situated in France³⁹¹.

³⁸⁷ Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 22, sent by e-mail of 1 December 2011 (19:33).

³⁹¹ Reply by [...] (reply to question 9) (Non-Confidential Version – Questionnaire to sugar suppliers / producers Italy – Phase II).

(d) *Market positioning*

- (464) Tereos holds [10-20]*% market share in the market for the supply of white sugar to industrial processors in Italy.

(e) *Perception by Tereos*

- (465) With regard to its Italian market entry Tereos puts forward that in the context of the reform of the sugar sector in the Union, Tereos benefited from important volumes of quota sugar to reallocate from France. Tereos therefore increased its sales into other Member States (from France) in 2005/2006 and at the same time carried out investments to develop its commercial presence outside France. In 2005/2006, Tereos reallocated volumes that were initially shipped outside the Union, taking into account pricing, customers requests and logistic aspects. This was the first stage of expansion of Tereos outside France. Since this period Tereos has been increasing its activities all over the Union by creating local subsidiaries. Indeed, Tereos developed a European network notably by creating commercial subsidiaries in various European countries. Tereos has therefore been in a position to satisfy the demand of its industrial clients that were increasingly requesting it to secure the supply of their plants throughout the Union³⁹². In Italy, Tereos sells only white sugar to industrial processors³⁹³.

(f) *Perception by competitors*

- (466) [A large Italian sugar producer]* describes Tereos on the Italian white sugar market as having very good access to input, with no infrastructure in Italy, very light national sales office, inexistent regional sales office and without partnership on the Italian white sugar market³⁹⁴ as well poor customer relationship³⁹⁵ and no ability to expand its sugar output³⁹⁶.
- (467) [A large sugar producer]* takes the view that Tereos (based in France) has a large sugar beet quota thus incurring low production costs and since Italy is close to its domestic market it can export to Italy without bearing high distribution costs³⁹⁷.
- (468) [A large Italian sugar producer]* also explains in respect of Tereos' successful market entry in the Italian white sugar market in 2006 that "*[t]he decrease of Italian production had to be compensated by higher French inflows as forecasted by the*

Commission" and such entry was easy in view of the sugar deficit created by the 2006 sugar reform³⁹⁸.

(g) *Perception by customers*

- (469) In view of [a large customer]*, Tereos represents the largest French sugar producer with big share on the Italian market and "*will definitely increase it*" while it delivers only from factories in the Union with some risk of limited quantities in case of bad crop or other events³⁹⁹ while, according to [a large customer]*, Tereos is not competitive but only follows the policy of Südzucker and it does not "*disturb*" the latter's market approach, its strength being that it has "*huge*" French production but is not flexible and has only a short term approach vis-à-vis the Italian white sugar market coupled with a low degree of services⁴⁰⁰. [A large customer]* describes Tereos without strengths while making echo of its poor customer relationship resulting from lack of trustworthiness⁴⁰¹. [A customer]* also doubts that Tereos is a competitive player on the Italian sugar market since it delivers from the northern part of France to Italy⁴⁰².
- (470) As for the incentives of Tereos to enter the Italian white sugar market, [a large customer]* underlines that Tereos is the largest French sugar producer whose production costs are the lowest interested in entering a deficit market such as Italy⁴⁰³. [A large customer]* or [a large customer]* see in Tereos' market entry only an opportunity to fill the gap in a largely deficit region that is Italy⁴⁰⁴ in order to market their "*surplus French sugar*"⁴⁰⁵ while [a large customer]* puts forward the proximity of the French sugar factories to Italy and such French factories are more competitive than the sugar produced in Italy⁴⁰⁶. From a different angle [a large customer]* would have the same view about the entry of Tereos on the Italian sugar market; it sees indeed that Tereos "*bought the market with low prices. Now, they get their money back!!*"⁴⁰⁷ in other words [a large customer]* seems to indicate that Tereos dumped French sugar on the Italian market in order to obtain market shares and once its market shares stabilised it was no longer necessary for it to maintain relatively low

⁴⁰⁷ Reply by [...]* ([...]* (reply to question 49) (Confidential and Non-Confidential Versions - Questionnaire to sugar customers in Italy – Phase II).

sugar prices. In this respect, [a customer]* also emphasizes that for the time being Tereos is not competitive and the quantities dedicated to Italy are "too low"⁴⁰⁸.

(h) *Assessment*

- (471) As already indicated, the notifying party puts forward that Tereos has strong links to a number of raw cane exporting countries, such as Mozambique. Moreover, it is also put forward that this access to sugar combined with a network of local distribution companies in Italy would enable Tereos to readily increase its LDC/ACP supply to Italy in case Südzucker/ESI would increase their prices in Italy following completion of the proposed transaction⁴⁰⁹.
- (472) However, Tereos expressly indicated to the Commission that it does not intend to expand its output in the Italian sugar market during the next three years and post-merger⁴¹⁰.
- (473) In the Commission's view, the ability and incentives for Tereos to substantially expand supplies on the market for supply of white sugar in Italy within the timeframe relevant for merger control are limited.
- (474) As analysed in recitals (398) and (402) of this Decision, the Italian sugar market is production limited, Italian competitors are capacity constrained, sugar stocks in the Union are very low and significant shortage of access to preferential raw cane sugar is commonly known by the industry. In such difficult market conditions of scarcity of sugar, other major players with established presence in Italy such as Tereos, do not have the capacities and incentives to redirect substantial additional sugar quantities from other Member States to Italy since it would entail commercial risks to lose existing customers, lower margins due to transport costs and risk of failure of expansion of market share due to risk of selective reaction of the post-merger entity.
- (475) Therefore, competitors such as Tereos would have limited ability to substantially increase white sugar supplies in Italy post-merger and such strategy does not appear to be profitable as it would imply the significant commercial risks to lose existing customers in the country of origin of the sugar, to get lower margins due to transport costs and the high risk of failure of expansion of market share due to the risk of selective reaction of the post-merger entity, Südzucker/EDFM.
- (476) Indeed, Tereos is the one and only non-domestic sugar manufacturer who succeeded in entering the Italian sugar market following the Union sugar reform in 2006/2007 without entering into cooperation with a local player. Indeed, other foreign players entered the Italian market such as Südzucker, Tate & Lyle, Cristal Union or Pfeifer & Langen but only in cooperation with local players such as MAXI, Eridania or Italia Zuccheri/COPROB. Therefore, its unique situation in the Italian sugar market

⁴⁰⁸ Reply by [...] (replied to question 49) (Confidential and Non-Confidential Versions – Questionnaire to sugar customers in Italy – Phase II).

⁴⁰⁹ Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 22, sent by e-mail of 1 December 2011 (19:33).

⁴¹⁰ See e-mails by the legal representatives of [...], Mrs [...] and Mr [...], of 10 January 2012 at 15:50 and at 16:12 "[w]e confirm that [...] does not intend to increase its presence in Italy in the next three years".

is obvious leading the Commission to pay particular attention⁴¹¹ in its analysis to the incentives of Tereos to enter, to develop its market presence in the Italian white sugar market and also its capacity to do so.

- (477) In the mid 2000 Tereos had at its disposal important sugar quantities to allocate in the Union. Indeed, in the context of the reform of the sugar sector in the Union, Tereos benefited from important volumes of quota sugar to reallocate from France and it therefore increased its sales into other Member States (from France) in 2005/2006 and at the same time carried out investments to develop its commercial presence outside France by having reallocated volumes that were initially shipped outside the Union, taking into account pricing, customers requests and logistic aspects⁴¹². In other words Tereos benefited from important sugar stocks that it could reallocate in deficit markets at commercially interesting price in order to develop its market presence in a given market⁴¹³.
- (478) Its market entry in Italy is thus rather a specific situation than reflection of the sign of significant competition. Indeed, [...] explains that Tereos' successful market entry in the Italian white sugar market in 2006 is due to the fact that "[t]he decrease of Italian production had to be compensated by higher French inflows as forecasted by the Commission" and such entry was easy taken into account the sugar deficit created by the 2006 sugar reform. This view is also acknowledged by Tereos when it explains that Tereos benefited from important volumes of quota sugar to reallocate from France to other Member States following the 2006 sugar reform. Indeed, Tereos therefore reallocated in 2005/2006 volumes that were initially shipped outside the Union and increased its sales into other Member States (from France) for the obvious reason to take advantage of deficit nature of the Italian sugar market. Indeed, Tereos' market entry can be seen as only a specific opportunity in the past to fill the gap in a largely deficit region that is Italy⁴¹⁴ in order to market their "surplus French sugar"⁴¹⁵.
- (479) However, notwithstanding the fact that Tereos entered recently the Italian white sugar market without local partnership, Tereos has remained a player with a light Italian sales organisation and is exclusively focused on supply of white sugar to industrial processors. Also, the market shares of Tereos have remained stable over the last years⁴¹⁶ since its entry and the lacunas in the quality of its customer relationship were also highlighted by some customers. All these elements taken together do not militate in favour of an analysis pointing towards a dynamic maverick entrant able to expand in Italy.
- (480) As for its future market development, in the light of its stable market presence in Italy, it is doubtful that Tereos will develop its sales organisation and will reallocate

⁴¹³ Reply by [...] ([...]) (reply to question 49) (Confidential and Non-Confidential Versions - Questionnaire to sugar customers in Italy – Phase II).

⁴¹⁴ Reply by [...] ([...]) (reply to question 49) (Confidential and Non-Confidential Versions - Questionnaire to sugar customers in Italy – Phase II).

⁴¹⁵ Reply by [...] ([...]) (reply to question 49) (Non-Confidential Version – Questionnaire to sugar customers in Italy – Phase II).

⁴¹⁶ See for example recital (189) of this Decision.

additional sugar quantities in Italy even in case of price increase. Indeed, the conditions of its market entry are different from the ones currently applicable in the Union and in Italian sugar markets and do not advocate for an incentive for further expansion. As explained by Tereos itself, its successful market entry in Italy was basically conditioned by two elements: (a) Italy is a deficit market, (b) it had available stocks to reallocate. While Italy is still a deficit market, sugar stocks in the Union are historically low therefore any strategy of expansion for Tereos would be much less profitable as it was in the past in view of the high number of significant risks that such a strategy would imply as described in recitals (398) and (402) of this Decision. In the same line of logic, Tereos expressly indicated to the Commission that it does not intend to expand its output in the Italian sugar market during the next three years, and therefore post-merger⁴¹⁷. The reason behind Tereos' market strategy with regard to Italy appears to be linked to the absence of enough quantities to be allocated in the Italian white sugar market.

(481) Therefore, Tereos would have limited ability and no incentives to expand on the Italian white sugar market, even in the event of price increase following the proposed transaction.

(482) Especially as for the ability and incentive of expansion by Tereos⁴¹⁸, the notifying party, in its reply to the SO, without putting forward new elements simply reiterates its arguments of the Form CO.

(i) *Conclusion*

(483) In light of the above, it is concluded that Tereos would have limited ability and no incentives to substantially expand output in the Italian market for supply of white sugar to industrial processors even in case of a price increase by the merged entity.

(v) *Zuccherificio del Molise*

(a) *Views of the notifying party*

(484) According to Südzucker, Zuccherificio del Molise has one of the four still active beet sugar factories in Italy. The quota allocated to Zuccherificio del Molise is between 60,000 and 70,000 tonnes/year. The production and sugar marketed is estimated to about 72,000-76,000 tonnes/year. Zuccherificio del Molise is located in the South of Italy. Südzucker assumes that most of the sugar produced is sold locally⁴¹⁹.

(b) *Historical background*

(485) Zuccherificio del Molise is a producer and distributor of sugar in the Centre and South of Italy⁴²⁰.

⁴¹⁷ See e-mails by the legal representatives of [...]*, Mrs [...]* and Mr [...]*, of 10 January 2012 at 15:50 and at 16:12 "[w]e confirm that Tereos does not intend to increase its presence in Italy in the next three years".

⁴¹⁸ Paragraphs 199 - 200 of the reply of the notifying party to the Statement of Objections.

⁴¹⁹ Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 23, sent by e-mail of 1 December 2011 (19:33).

⁴²⁰ Reply by [...]* ([...]* (reply to question 5) (Non-Confidential Version – Questionnaire to sugar suppliers / producers Italy – Phase II).

(c) *Infrastructure*

- (486) Zuccherificio del Molise has a beet sugar factory in Termoli with an annual quota of 84.326tonnes/year⁴²¹.

Market positioning

- (487) Zuccherificio del Molise holds [0-5]*% market share in the market for the supply of white sugar to industrial processors in Italy.

(d) *Perception by competitors*

- (488) [A large Italian sugar producer]* describes Zuccherificio del Molise on the Italian white sugar market with poor access to input, poor infrastructure, poor customer relationship, poor national-regional sales office and without any partnership and in addition without the ability to expand its output on the Italian sugar market⁴²².

(e) *Perception by customers*

- (489) [A large customer]* puts forward that Zuccherificio del Molise is a public sugar producer in a deficit area with low volume produced coupled with financial instability and low market shares⁴²³. [A customer]* indicated that "*ESI/SFIR, MAXI and Italia Zuccheri have more strengths compared to Eridania/Tereos and Zuccherificio del Molise*"⁴²⁴ or [a customer]* putting forward that ESI, Italia Zuccheri, Eridania and Zuccherificio del Molise have their own refineries in Italy which constitutes a competitive advantage. However, none of those sugar producers/suppliers has large sugar quantities⁴²⁵. The description by [a larger customer]* is much less positive since it is put forward that "*they should have disappeared several years ago*" maybe for political reasons they have not⁴²⁶ while [a customer]* explains that it is not a competitive market player⁴²⁷.

(f) *Possibility to expand output*

- (490) The notifying party does not submit that Zuccherificio del Molise would be in a position to expand its sugar output on the Italian white sugar market and it was several times underlined that Italian customers are very much concerned by the lack of sufficient sugar quantities at the disposal of the Italian sugar producers /

⁴²⁴ Reply by [...]* ([...]* (reply to question 45) (Non-Confidential Version – Questionnaire to sugar customers in Italy – Phase II).

⁴²⁵ Reply by [...]* ([...]* (reply to question 45) (Confidential and Non-Confidential Versions – Questionnaire to sugar customers in Italy – Phase II).

⁴²⁶ Reply by [...]* ([...]* (reply to question 45) (Confidential and Non-Confidential Versions - Questionnaire to sugar customers in Italy – Phase II).

⁴²⁷ Reply by [...]* ([...]* (reply to question 43) (Confidential and Non-Confidential Versions - Questionnaire to sugar customers in Italy – Phase II).

suppliers⁴²⁸. In this respect, [a large Italian sugar producer]* claims that Italy is a highly deficit country in terms of sugar⁴²⁹ and no player on the Italian market is in a position to expand in a short period of time its output as a reply to a price increase due to the fact that "*all the players deal with production quotas which are fixed and with constraints in access to preferential sugar*"⁴³⁰. [A customer]* underlines also with regard to Zuccherificio del Molise that it does not have large sugar quantities⁴³¹.

(g) *Assessment*

(491) Neither Südzucker or any other competitor nor customers take the view that Zuccherificio del Molise would be a well positioned competitive market player able to expand its white sugar supplies in the event of an increase of white sugar prices following the proposed transaction on the Italian market.

(h) *Conclusion*

(492) Following the analysis of the above, Zuccherificio del Molise does not seem to be a well-positioned market player and does not seem to have the ability and the incentives to substantially expand output in the Italian market for supply of white sugar to industrial processors in the event of a price increase by the merged entity.

(vi) *Others (other Union or Balkan sugar producers / suppliers)*

(493) The notifying party also claims that other sugar producers in the Union or in the Balkans (Serbia and Croatia) also exert competitive constraint on the post-merger entity⁴³². The in-depth market investigation, however, did not confirm this view.

(a) *Views of the notifying party*

(494) Südzucker claims that there are a number of other players from the Union who supply the Italian market. Such producers include Group Vermandoise, Cosun/Suiker Unie, British Sugar/Azucarera Ebro or Krajowa Spolka Cukrowa, Sunoko doo, Kandit Premijer, Viro Tvornica Secera etc.⁴³³.

⁴²⁸ For example, Reply by [...]* ([...]* (reply to question 45) (Non-Confidential Version – Questionnaire to sugar customers in Italy – Phase II), Reply by Daila (2011/129886) (reply to question 45) (Non-Confidential Version – Questionnaire to sugar customers in Italy – Phase II), Reply by [...]* ([...]* (reply to question 45) (Confidential and Non-Confidential Versions – Questionnaire to sugar customers in Italy – Phase II), Reply by [...]* ([...]* (reply to question 45) (Confidential and Non-Confidential Versions – Questionnaire to sugar customers in Italy – Phase II), Reply by [...]* ([...]* (reply to question 45) (Confidential and Non-Confidential Versions – Questionnaire to sugar customers in Italy – Phase II) or Reply by Nestlé (2011/130092) (reply to question 23) (Non-Confidential Version – Questionnaire to sugar customers in Italy – Phase II).

⁴³¹ Reply by [...]* ([...]* (reply to question 45) (Confidential and Non-Confidential Versions – Questionnaire to sugar customers in Italy – Phase II).

⁴³² Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 23, sent by e-mail of 1 December 2011 (19:33).

⁴³³ Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 23, sent by e-mail of 1 December 2011 (19:33).

- (495) The notifying party has estimated sales by those "other competitors" (including both other Union and Western Balkan producers) at 78,000 tonnes in 2010 (56,500 tonnes industry and 21,500 tonnes retail), at 79,058 tonnes for 2011 (57,464 tonnes industry and 21,594 retail) and at 67,000 tonnes for 2012 (57,000 industry and 10,000 retail)⁴³⁴.
- (496) In this respect it is also put forward by the notifying party that a significant price increase by Südzucker/ESI, which does not result from the increase of the sugar price on the world market, would provide an incentive for those sugar producers to enter/expand on the Italian market as customers would switch demand away from Südzucker/ESI and towards other sources⁴³⁵.

(b) *Market investigation*

- (497) As for sugar producers established in the Union, within the course of the second phase investigation, [a large sugar producer]* indicated to the Commission that it currently has no activities on the Italian market⁴³⁶, [a large sugar producer]* stated that it does not supply and has not ever supplied Italy from any of its production facilities⁴³⁷ while only [a sugar producer]* indicated to have supplied some quantities in Italy but only limited quantities⁴³⁸.
- (498) Concerning Western-Balkan sugar (Serbia / Croatia), most importantly, in its reply to the Commission in-depth market investigation, [a sugar producer]* indicated to the Commission that it is not able to expand in a short time period its production quantity in response to a price increase or sugar deficit in the Italian sugar market and that it has no competitive advantage in terms of transport costs in Italy⁴³⁹.
- (499) In this respect [a large sugar producer]* takes the view that third countries of the Balkans which are close to Italy can exert a competitive pressure on Italy since imports from these countries have a duty free access to the Union market (equal to 380,000 tonnes)⁴⁴⁰.

⁴³⁴ Answers to 3rd Request for Information to Südzucker 1/2 [GL-AM.FID10603463], Form CO – Italy, page 23, sent by e-mail of 1 December 2011 (19:33).

⁴³⁹ Reply by [...]* ([...]* (reply to questions 93 and 95) (Non-Confidential Version – Questionnaire to sugar suppliers / producers Italy – Phase II) (ID 2364).

⁴⁴⁰ Reply by [...]* (reply to question 65) (Non-Confidential Version – Questionnaire to sugar suppliers / producers Italy – Phase II).

- (500) On the other hand [a large sugar producer]* states that it has not observed any competitive constraint from producers in countries such as Serbia or Croatia on the Italian white sugar market⁴⁴¹.
- (501) In the same context [a large Italian sugar producer]* explains that the success of export from the Balkans to Italy was linked to a positive swap of world market sugar, with these countries exporting their production and importing for their domestic consumption needs. Consequently, in the event of an increase in international market prices there is no interest to supply Italy from the Balkans. In addition Eastern European countries which are also deficit countries are closer to the Balkans sugar producers and will therefore (allegedly) be first supplied⁴⁴². The same view is held by [a large sugar producer]* which submits that *"it is generally difficult to bring more white sugar to Italy from the Balkans. Especially for Croatia it is anticipated that there will be a reduction in the available quantity to be exported due to the entry of the country in the EU. Following accession Croatia will have a quota of approximately 190.000 tonnes while currently it exports to the EU 180.000 tonnes and domestic consumption is approximately 70.000 tonnes. White sugar from the Balkans goes mainly to Slovenia, Hungary and Greece"*⁴⁴³.
- (502) Seven Italian wholesalers including [a customer]* indicate that they purchase sugar from the West Balkans (Croatia and Serbia)⁴⁴⁴ and [a customer]* indicates that Serbian and Croatian sugar has been imported in Italy for many years by Italian traders⁴⁴⁵. On the other hand, most customers [a customer]*⁴⁴⁶, [a customer]*⁴⁴⁷, [a customer]*⁴⁴⁸, [a large customer]*⁴⁴⁹, [a large customer]*⁴⁵⁰, [a large customer]*⁴⁵¹, [a large customer]*⁴⁵², [a large customer]*⁴⁵³ or [a large customer]*⁴⁵⁴ indicate that
